"I Plow now where I was never able to use horses"

"My LAUSON Tractor has been a paying investment. I have plowed with it in a good many places where I was never able to plow with horses. I used the Tractor for running feed cutter, clover huller and pulling out stumps. It is an all-around labor-saver. Another place where the LAUSON has come in especially handy is pulling manure spreader."

New Holstein, Wisconsin
August 25, 1918.

The John Lauson Mfg.Co,
New Holstein, Wisconsin.

Gentlemen:-

My tractor has been a paying investment. I have plowed with it in a good many places where I was never able to plow with horses. I used the tractor for running Feed Cutter, Clover Huller, Sawing Machine and pulling out stones.

It is an all around labor saver. Another place where the Lauson has come in especially handy, is pulling Manure Spreador.

Yours truly,

(Signed) Joe Pauly.

The LAUSON is built by an old established farm engine manufacturer—backed by years of skill and manufacturing resources. Not low in price, despite favorable labor conditions and efficient production—but lowest in point of service and satisfaction.

The LAUSON does what you would expect a high-quality tractor to do.

Write for more information before you buy any kind of a tractor. It will pay.

DRIED FRUITS

Prunes:
Prune prices announced by the California Prune and Apricot Growers, Inc., were for the base prices, according to sizes, and are: 20-30s, 22c flat; 30-40s, 16c; 40-50s, 14c; 50-60s, 12c; 60-70s, 11½c; 70-80s, 11c; 80-90s, 11c; 90-100s, 11c. One cent a pound premium will be paid on fruit delivered before September 20. On small-sized fruit 8½ cents a pound will be paid for 100-120s and 7½ cents for 120s and smaller.
Peaches:
Peach prices announced by the California Peach Growers, Inc., for 1919 crop dried peaches for the domestic and foreign trade; September, October, November shipment, seller's option; guaranteed against our own decline until January 1, 1920, are as follows:
Standard yellows, 14¾c; Muirs, 15c.
Choice yellows, 15½c; Muirs, 15½c.
Fancy yellows, 16½c; Muirs, 17½c.
Extra fancy yellows, 17¾c; Muirs, 18¾c.
Slabs, yellows, 14½c.
For "practically peeled" add 1½c per pound (any grade).
Prices above are all bulk basis.
For packing in 50 pound or 25 kilo boxes add 1 cent per pound.
25 pound or 12½ kilo boxes, all 1¼c per pound.
10 pound boxes, add 2 c per pound.
Blue ribbon peaches packed 2 pound cartons, 12 per case, $10 per case.
Blue ribbon peaches packed 2 pound cartons, 24 per case, $10 per case.
Bakers' special, "practically peeled," 16¾c per pound, bulk basis.
Apples:
Choice (in 50s), 20@20½; extra choice (in 50s), 21@21½; fancy (in 50s), 23@23½.
Figs:
White: Cooking (in 50s), 15@16; choice (in 50s), 17@18; extra choice (in 50s), 19@20; fancy (in 50s), 21@22; extra fancy (in 50s), 23@24; bricks, 12 No. 10s, 1.60@1.67½; bricks, 24 No. 8s, 2.55@2.65; bricks, 50 No. 6s, 4.00@4.15; bricks, 70 No. 4s, 4.20@4.25; layers, No. 10, 2.50@2.80. Calimyrna: Cooking (in 50s), 19; choice (in 50s), 23; extra choice (in 50s), 24; fancy (in 50s), 26; extra fancy (in 50s), 27½; bricks, 10 1-lb., 2.75; layers, No. 10, 2.95@3.20. Black: Standard 14, choice 17@18; extra choice, 18@19; fancy, 19@20.
Pears:
Standard 20, choice 22½; extra choice, 24; fancy, 26@27.

HONEY

Extracted jobbing prices: Water white and white, 18 and 20 per lb.; light amber, 16@18; amber, 14@16½; comb, 25@28 for white and water white and 20@22½ for light amber.

RICE

The California market shows a stronger tone and there is every reason to believe that advances will occur in that market, due to the strength of the Oriental market. Prevailing prices range from $12 to $12.25 for spot and futures. The New Orleans market remains very firm and they advise that inquiries are much better from both Cuba and Porto Rico.

BEANS

Jobbing price per cwt.: Small white, 6.00@6.25; large white, 6.00@6.50; cranberry, 7.00@7.10; red Mexican, 8.35@8.50; pink, 6.30@6.50; California Bayo, 9.25@9.50; blackeye, 7.25@7.35; red kidney, 12.00@13.00; lima, 12.50@13.00; Garvanza, 9.50@10.50; Kotenashis (in bond), old crop, 5.25; new crop, 5.75.
Dried Peas—California, 5.25@5.40 per cental for green, recieancd.

GRAIN

Wheat: The prices are based upon federal grades and standards at the terminals in San Francisco Bay and Los Angelcs, and are as follows, per bushel of 60 pounds:

	Per Bushel	Per Cental
Hard White—		
No. 1	$2.20	$3.66 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	$2.18	$3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51½
Club and Sonora—		
No. 1	$2.16	$3.00
No. 2	2.13	3.55
No. 3	2.09	3.48½

The above are minimum prices.
For sacked grain add 4½ cents per bushel of 60 pounds to above prices. Deductions of three-fourths of a pound made for weight of standard grain bags. Wheat grading under No. 3 mixed or smutty wheat will be purchased according to merit.

HAY

Under date of March 6, Scott-Magner & Miller says:
Receipt of hay past week, 560 tons. This large dropping off in receipts no doubt was caused by the recent rains throughout this section and Nevada, where it has been storming so that they could not load for shipment. Although the rains which we have had during the week have been most beneficial and really a Godsend to the state, yet they have not been sufficient to entirely make up for the long dry spell and much more rain is needed. Crops are not suffering at the moment and we have hope. Many have looked for lower prices but the market has remained very firm and top quotations have been obtained without difficulty. Thousands of tons of alfalfa have been brought into this state from Nevada and hay from Oregon is now moving this way in quantities. A small quantity of California hay is still available. Dealers are placing Oregon and Nevada hay wherever possible in order to retain the California hay for such trade as demand it. The United States government was in the market again this week for about 5,000 tons of hay for the various posts and also for shipment overseas. These heavy demands naturally have a tendency to strengthen the market also.
We report the market higher, and quote today wholesale prices in carload lots as appear from dealer's transfers upon the hay market in San Francisco—for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat Hay (light 5 wire bales)	38.00@41.00
No. 1 Wheat or Wheat and Oat Hay	35.00@38.00
No. 2 Wheat or Wheat and Oat Hay	33.00@35.00
Choice Tame Oat Hay	37.00@40.00
Other Tame Oat Hay	33.00@37.00
Wild Oat Hay	Nominal
Barley Hay	Nominal
Alfalfa Hay	32.00@37.00
Stock Hay	29.00@32.00
Oregon Cheat and Oat Mixed	27.00@29.00
No. 1 Barley Straw, per bale	.70@ 1.00

Citrus Markets

Los Angeles, March 10, 1920.

Naveis are going forward at the rate of about 150 carloads daily. Shippers are embarrassed by large proportion of offs. Fruit is beginning to puff somewhat. Rigid culling, however, is keeping grade up and good prices are still prevailing. The keen demand for lemons scems to have sagged somewhat, due in part to the immense number of forcign lemons in sight. There are now some 170,000 boxes for deilvery at Atlantic Coast points.

Shipments

Shipments of citrus fruit to date from Southern California since November 1, 1919: Oranges, 9,440 cars; lemons, 2,109; total, 11,549. To same date last season: Oranges, 9,639; lemons, 2,537; total, 12,176. From Central California this season: Oranges, 3,476; lemons, 259; total, 3,735. To same date last season: Oranges, 2,236; lemons, 285; total, 2,471. From Northern California this season: Oranges, 260; lemons, 20; total, 280. To same date last season: Oranges, 234.

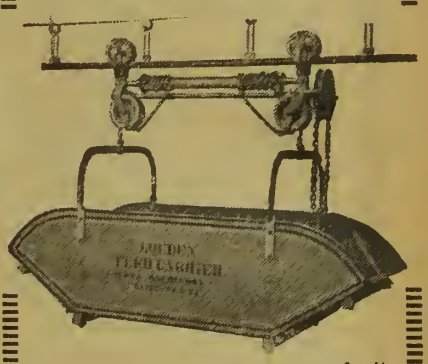
How Long Does It Take To Clean Your Barn?



You will find that you can do it in from ONE-THIRD TO ONE-HALF the time it formerly took, after you install a

LOUDEN Litter Carrier

Labor saved and time saved. No more back-breaking shoveling and wheeling it out in small loads. Now you let the Litter Carrier down to the ground—fill it up (holds 10 bushels)—hoist it up and push it out right over the manure pit where you dump it, liquid and all, because it's WATER-TIGHT.

Write for Free Copy of the Louden Barn Plan Book together with big illustrated Louden Catalog.

Great Implement Bargains

To close out my factory stock of serviceable implements indicated below I will make the big reductions listed. This is fine usable material that has been in storage. Prices are going up rapidly and you can SAVE FROM 40 per cent to 60 per cent on plows, cultivators, harrows, balers, etc.

2 2-gang South Bend Little Giant Plows. Regular price each $180. Will sell for only $110 each.
2 4-gang South Bend Little Giant Plows. Regular price $220. Will sell for only $140 each.
4 12-foot Plano Push Headers. Regular price $500. The Plano is the best header ever put into a California grain field. Sale price, each, $300.
1 8-foot Plano Pull Binder, never used. Sale price only $225.
1 6-foot, 1 7-foot Plano Pull Binder. Big bargains at $215 each.
2 4-row Bean Planters. Regular price $125. Sale price, each $95.
1 4-row Brenneis Beet Planter. Regular price $145. Sale price, $55.
4, 5 or 6- gang Hancock Engine Disc Plows at a big saving.
2 Benicia Beater type single disc plows. 28 inch disc. Price only $75 each. Price only $125.
6 No. 8 South Bend Riding Corn or Cotton Cultivators. Selling elsewhere for from $75 to $85. Sale price, each $60.
8 No. 4 one-row riding Corn or Cotton Planters. Regular price, $75; for $50. These planters can also be made into middle busters or listers.
1 8-disc Orchard Disc Harrow. This will save you $50. Sale price only $65.
1 Benicia Beater type double disc plow. 28 inch disc.
2 100-gallon Tub Traction Power Sprayers. Regular price $125, each $75.
1 Two cylinder, 4 cycle, 8 h.p. gasoline engine. Only $200. This engine sold for upwards of $400.

ROPE! ROPE! ROPE!

Several thousand feet ¾ inch to 1½ inch manila rope, 50 Per Cent to 60 Per Cent. of Regular Price.
1 4-wheel Pope Toledo Chassy make Trailer; only $50.

TRACTOR BARGAIN, SAVE $750

1 15-30 Rumely Gas Pull Tractor, only $1250.
1 Chamberlain Elevating Grader, only $600.
1 10 H. P. Faulk Gas Engine. Price $175.
2 17x22 Roberts Power Balers. Worth $800 each. Balers will be scarce this year. Save money by buying these at only, each $500.
1 17x22 Western Power Baler with 10 H. P. Engine. A good buy at $850.
1 6 H. P. Fuller Johnson Gas Engine. Price $170. All above are second hand, but in good condition.

During the war, material and labor restrictions were such that my manufacturing plant was practically idle and retail store was closed. I now desire to close out all stock on hand and prices at which goods will be sold are at discount of from 40 per cent to 60 per cent of what same goods are quoted elsewhere. It will pay you to invest in anything listed here that you can use. Many factories have withdrawn prices on their goods and further advances are expected if the goods can be supplied at all.

On harvesting machinery orders will be accepted subject to cancellation in case of loss of crop.

DR. HESS DIP and DISINFECTANT

Give your poultry and animals the best living conditions by using Dr. Hess Dip and Disinfectant. It is a powerful germ destroyer—helps to keep off contagious diseases. Make the rounds of the poultry house, pig pens and stables regularly with the sprinkling can. Kills hog lice. Don't neglect the garbage cans, drains, foul-smelling and disease-breeding places. An excellent disinfectant for the home. One gallon makes 100 gallons solution.

Dr. HESS & CLARK
Ashland Ohio

Sick Baby Chicks?

There is only one way to deal with baby chicks and that is to keep them well. Doctoring a hundred or more chicks is mighty discouraging work.

It's pure carelessness to lose more than 10 per cent of chicks, from hatching to full growth. Many lose 40 per cent to 60 per cent, and even more. No profit in that.

Our book, "Care of Baby Chicks" (free) and a package of Germozone is the best chick insurance. WITH BABY CHICKS YOU MUST PREVENT SICKNESS—NOT ATTEMPT TO CURE. "I never had a sick chick all last season"—C. O. Petrain, Moline, Ill. "Not a case of white diarrhoea in three years"—Ralph Wurst, Erie, Pa. "Have 800 chicks now 5 weeks old and not a single case of bowel trouble"—Mrs. Wm. Christiana, Olive Ridge, New York. "Two weeks after we started last spring we were a mighty discouraged pair. Every day from three to six chicks dead. A neighbor put us next to Germozone and we are now sure if we had had it at the start we would not have lost a single chick"—Wm. E. Shepherd, Scranton, Pa.

GERMOZONE is a wonder worker for chicks, chickens, pigeons, cats, dogs, rabbits or other pet or domestic stock. It is preventive as well as curative, which is ten times better. It is used most extensively for roup, bowel trouble, snuffles, gleet, canker, swelled head, sore head, sores, wounds, loss of fur or feathers. 25c, 75c, $1.50 pkgs. at dealers or postpaid.

Fryers in Ten Weeks

By Jean A. Koethen

TO bring Rhode Island Red chicks to broiler size in eight weeks and to fryer size in ten weeks is something of an achievement, but one that is an old story to W. R. Beard of the Ontario district. Mr. Beard hatches the year through, except for the two hottest summer months, has done so for several years, and keeps his brooder houses filled with a steady procession of cockerels and pullets, the former for market, the latter for his laying houses if they are first class, otherwise they, too, become table poultry.

The market poultryman is hard to find these days. High prices of feed, prices of table poultry high enough, doubtless, for the consumer, but hardly commensurate with cost of feed, have turned the eyes of the poultry fraternity toward the production of eggs rather than of meat. Where one is successful with market poultry it is because he has the energy and persistence to work out a system and then make it work.

One secret of Mr. Beard's success is that he lives with his hens. "He knows every one by name, I think," laughed Mrs. Beard, "and it is nothing for him to spend the whole evening in the chicken yards, handling them on the roosts to find which have their crops as full as they should be, and which will lay tomorrow."

Another secret is that he hatches from big hens, selects big eggs for hatching and is extremely particular about the size of the male bird. No undersized breeders for him. If you want chicks that will grow rapidly, they must come from heavy, big-boned ancestry.

Red Rock Crosses

About 600 Rhode Island Reds and a smaller number of Barred Rocks are kept on this little ranch of not more than five acres. The Reds have been there seven years, the Rocks four. The Reds have been systematically bred for egg production till last year one pen averaged 214 eggs and another, containing 12 hens, 226 eggs.

The Barred Rocks were added with the purpose of crossing the two breeds, and some interesting results have been worked out. The mating of a Barred Rock male to Rhode Island Red females give fine, heavy, hardy birds, about the weight of a Rock, and of very similar appearance except that the markings are a little smutty. The young stock from this mating grows rapidly and makes splendid fryers. The cross of Red males on Rock females is not so good. The birds are less hardy and are of a peculiar black and brown color combination which is not attractive. Mr. Beard showed us a row of pens of both crosses, but has not found that the cross breeds grow faster or lay better than the pure breds. His experiments are interesting, and some of the birds from the first cross may be heavier than the average Rock or Red, but he does not advocate crossing as a means of improvement, though it does produce good market poultry in the first generation.

Raising the Chicks

As soon as they come from the incubator the chicks are placed in brooder houses eight feet square, the sides of which are lined with roofing paper to a height of three or four feet and the floor covered with dry sand and alfalfa hay. Fifty chicks are placed in a house, no more and no less. The first feed is of the simplest: Corn meal in one hopper, bran in another, Croley's high protein meat in a third. Cracked milo is thrown in the litter for the chicks to scratch out. A big brooder stove provides ample heat. As soon as the chicks will pick it up, they get whole milo instead of cracked. This is all their ration, except green feed, water, grit and shell, the first six weeks.

At the end of the sixth week the young stock, which are now approaching broiler size, are put on the laying ration, consisting of 400 pounds corn meal, 200 pounds ground barley, 480 pounds bran, 160 pounds meat and ten pounds salt.

By the end of the eighth week the birds intended for broilers are sent to market without further finishing. Sometimes, even on the simple dry mash and milo which has been their only fare, they are too heavy by the end of the eight weeks and require to be dieted a little to "reduce."

When the broilers are marketed the fryers are shut up, sometimes in small pens, sometimes in crates, and fed a moist mash for the last two weeks. Mr. Beard does not consider crate fattening essential to the production of a tender fryer, but is giving it a tryout.

The pullets, when they are taken from the brooder house, and such of the cockerels as are to be kept for breeders, are put in the weaning coop shown in the cut. The slatted portion is the run; the boarded-up portion the coop where the birds roost, which is from four to five feet square. The floor is a foot or more from the ground, so that the birds may walk under it, and easily removed for cleaning.

Mr. Beard sells his birds to a huckster who comes to the door, and who pays him regularly three cents under the wholesale market. He considers the raising of market poultry merely a sideline, though admitting that he received $1,500 last year for fryers and broilers. That the constant raising of young stock involves a good deal of work does not worry him at all, because, as I said in the beginning, he loves his birds and likes to be with them and counts the production of an extra good market bird as a most worth while task.

Convenient Weaning Coop

Cover of boarded up portion is hinged at top, and floor and roosts are readily removed for cleaning.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

During the fifteenth week of the contest at Santa Cruz seven pens went over 70 per cent for the week. Geo. G. Barker of Santa Cruz leads these with an average of 74 per cent for his ten hens for the week.

High pens for the week: Barker, 52 eggs; Wood, 51; Bellows Bros., 51; Binney, 50; Neef, 50; Amsbaugh, 50; Walls, 49.

Leading pens to date: Walls, 633 eggs; Neef, 567; Rose, 559; Enterprize, 548.

Leading individuals to date: Walls, 92 eggs; Walls, 79; Peck, 78; Enterprize, 77; Barker, 76; Gibson, 75.

The Southern Oregon Poultry Association elected the following officers at its regular annual meeting: President, Henry W. Frame; vice-president, J. O. Isaacson; secretary, C. Gus Brommer; treasurer, M. F. Sheets.

SOME CAT

Little Donald, the promising son of a well-known automobile man was intensely interested in the cat on the hearth before the fire. Suddenly he turned and announced excitedly:

"Mamma, he's got his motor going."

Poultry Queries

Conducted by J. A. Koethen

Turkey Eggs Don't Hatch

I want to know why my turkey eggs are not hatching. I have set three hens, also a small incubator, and no turks appear. I have given best of care to incubator and hens so I know the trouble is not there. I am feeding equal parts rolled oats, whole wheat and milo, about one-tenth meat scrap, with charcoal and oyster shell before them always. They are kept penned up until noon every day, then are turned into one-half acre alfalfa lot; also just before dark are allowed to range under oaks and where they may, and a handful of wheat is given them to bring them up to roost. The morning feed consists of about one quart of the mixture mentioned. There is a two year old tom with the two and one-half year old hens and I have seen him mate with the eight different hens. The hens lay splendidly, but the eggs do not hatch. I tested at ten days after setting and a slight cloud appears on the top of the eggs, all the same. I have broken several open and they were apparently O. K. so it seems that the eggs were not fertile. Do you think it advisable to change toms? The hens laid well last year and no trouble in hatching occurred, but a different tom was used and the hens were running loose all the time and stole their nests outside of the pen. The birds are in good condition, not fat, so if you can shed any light on this I will be, certainly, deeply gratified.—Subscriber, Lakeside.

Your tom may be to blame for the infertility of the eggs, but I cannot help suspecting the hens may be fatter than they should be. I think this because they are old hens, because they are rather closely confined for breeders, and because you are feeding milo, which is too fattening for breeders. A little feed of wheat bran with a small quantity of flowers of sulphur added every other day is recommended for breeders that must be confined, but it is much better to let them range and feed just a handful of oats or wheat at night. Some breeders prefer to hatch from yearling hens, just because the older hens are likely to be too fat. Oats are particularly good for fertility. One very successful man feeds nothing but oats, meat and vegetables. If the birds are on good range, only the oats are needed. It might be well to try another tom, or possibly use the two in the pen together. Unless the hens are too fat, this should insure fertility.

Feed for Egg Production

What changes would you suggest in this formula for feed for egg production: Six parts bran, two parts barley (ground), two parts beans (ground), two parts fish meal, one part corn (ground), one part charcoal. To this is added Surelay in the proportion of three parts Surelay to two parts mixture. Grain at night, wheat, barley and milo, equal parts. Now feeding buttermilk, one pound to six water. This using of buttermilk (commercial) is quite recent and seems to be having a beneficial effect. Can you suggest a more balanced ration?—Subscriber, Escondido.

The chief trouble with your mash is that it contains too much fibre and too little digestible fat and carbohydrates. Both the bran and the ground barley contain a great deal of fibre and the beans, if they are the common field beans, have neither as much protein nor as much fat as the soy bean, which is generally used in mashes. If you must use the beans—and of course you must if you have them—why not make half your vegetable protein content of a sort which contains more fat, say soy bean or linseed meal? I would also drop part of the bran and substitute low grade flour, which is richer in carbohydrates, of which Leghorns need a good deal, and instead of two parts fish meal, use one and one-half parts fish and one and one-half parts beef scrap. For some reason fish meal alone is not quite as satisfactory as fish meal and beef scrap used together. Your mash formula will then read: Four parts bran, two parts low grade flour, one part ground beans, one part linseed or soy bean meal, one and one-half parts each beef scrap and fish meal, one part corn meal. To this add two and one-half pounds charcoal and one-half pound salt for every 100 pounds of mash. I am suggesting this formula without knowing the composition of Surelay. If it contains a good deal of meat you will have to use less in the mash. It is better, if you wish to use it, to follow the directions of the manufacturer. You do not say how you use the semi-solid buttermilk. It is generally used for moistening the mash once a day and seems to give better results fed in this way than when given alone. The mash recommended by the experts at the university farm consists of five pounds bran, five pounds shorts, three pounds meat scrap, two pounds soy bean meal, five pounds ground barley, one-half pound charcoal, one-tenth pound salt. Now that shorts is so hard to get I presume they substitute low grade flour. The scratch grain used with this consists of 15 pounds wheat, ten pounds barley, five pounds cracked corn or whole Egyptian corn.

Feeding Stimulants

A subscriber writes as to feeding conditioners or stimulants which will secure greater number of eggs during the cooler months. It must be borne in mind that in feeding these stimulants the vitality of the egg is more or less affected and hatching percentage lowered.

EGGS AS FOOD

Hazel Zimmerman, home demonstration agent of the agricultural extension service, gave a unique demonstration during Farmers and Housekeepers' Week at Tucson, Arizona, which showed the high value of eggs as food. Miss Zimmerman says that the composition of hens' eggs compared with that of moderately lean beef is as follows: Hens' eggs—Water, 73.7 per cent; fat, 10.5 per cent protein, 14.8 per cent; mineral matter, 1 per cent. Lean beef—Water, 70.5 per cent; fat, 8.5 per cent; protein, 20 per cent; mineral matter, 1 per cent.

The protein in the white of the eggs is nearly pure albumen. The yolk of the egg is of greater nutritive value than the white. It is rich in the following mineral salts: calcium, iron, potassium and phosphorus, and contains them in such a form that they are readily absorbed and utilized by the body. The white of the egg is rich in sulphur.

Value as Food

By comparing the composition of the egg with that of lean meat, it will be noticed that eggs make a good substitute for meat. Nine average sized eggs weigh one pound and contain about the same amount of nourishment as one pound of beef. As eggs contain no starch or sugar, they should be served with such foods as rice, bread, fruit, potatoes and other vegetables or made into desserts with sugar, tapioca and similar materials.

Digestibility of Eggs

Raw eggs are very easily digested. The digestibility of cooked eggs depends upon the manner in which they are cooked. They should be cooked at a low temperature. Egg albumen begins to coagulate at 134 degrees Fahrenheit, becomes jelly-like at 160 degrees Fahrenheit, hard at 180 degrees Fahrenheit, and when heated to the boiling point, or 212 degrees Fahrenheit, it becomes a tough, leathery mass and very indigestible.

GET MORE EGGS.

"Lady Victory"

1918 Champion laid 304 eggs in 365 days. Highest official record of any living hen. She laid 25 eggs in Jan., 27 in Feb., 29 in March.

Milkoline will help make your hens lay more eggs.

Feeding Milkoline will make you more money—reduce mortality of your flock—keep flock healthy and less liable to disease.

Increase Poultry Profits Any poultry raiser can easily double his profits by doubling his egg production. Feeding Milkoline with other feed greatly assists assimilation, keeps digestive organs vigorous and is a wonderful appetizer, tonic and bowel regulator. Milkoline contains nutritive elements vital to egg production and not found in grain rations.

13,000 More Eggs

Jas. E. Keyes, Petaluma, Calif., says: "After feeding Milkoline for eighteen months to 2,500 hens, I find that worms cannot exist in poultry where Milkoline is used. I reduced mortality with laying hens 10 per cent. I increased the egg production of my flock thirteen thousand eggs in one year. Feeding Milkoline to laying hens keeps them in splendid health thereby preventing disease and derangements of all kinds."

Lowers Feeding Cost

Many feeders say Milkoline lowers feeding cost one-third, because their hens assimilate all feed they eat. Our liberal Guaranteed 30 Day Trial Offer enables you to try Milkoline at our risk—to prove that it will make you mighty good money.

Milkoline has a base of modified buttermilk with essential fats and acids added. Milkoline comes in condensed form. Will not mould, rot or sour. Keeps indefinitely in any climate. Milkoline is simply "Good Buttermilk Made Better for Feeding." Flies don't bother it.

Prevents Disease

Milkoline is not featured as a cure for anything or a preventative, but due to the acidity in the buttermilk it is a germ destroyer and helps keep poultry healthy, which is the best preventative against disease. Milkoline is invaluable as a life saver for baby chicks.

PRICES

These prices are F.O.B. Kansas City or the address of our nearest dealer. Dealers in all parts of the United States.

5 Gal. Keg - $7.50
10 Gal. Keg - 12.50
15 Gal. Keg - 16.50
32 Gal. Barrel 32.00
55 Gal. Barrel 49.50

Prices on smaller packages given in booklet. Buy in barrel lots—it saves you money.

Only 2c a Gallon

For feeding mix one part of Milkoline to 50 parts of water (small feeding 5 tablespoons to gallon of water). Feed either with water or mash feed. Milkoline keeps their appetite keen and its action is highly essential to normal egg production. When fed as directed Milkoline costs only 2c a gallon or less. Trauhaft & Newman, Lankershim, Calif., say: "We would not go back feeding straight buttermilk at any price."

Guaranteed Trial Offer

we will ship you 1 Gallon for $2.25, express prepaid. Take 30 days—feed half to your poultry. If not entirely satisfied simply return unused portion and we will refund every cent you paid us. No charge for portion you have used. Milkoline is legally guaranteed to be satisfactory. You are always the judge. We suggest ordering larger quantity—you get the benefit of lower price—you risk nothing—you must be satisfied or we refund every cent you paid us. Make this test now. The sooner you begin using Milkoline the quicker you will be making money.

Milkoline has been producing so many amazing results and we are so certain of what it will do for you that

The Reliable Blue Flame Wickless Oil Heated Hover

This Hover Represents Our 30-Inch 42-Inch and 52-Inch Sizes.

THE MODERN HOVER

This hover has the same chick capacity as the coal burning brooder. They are made in four sizes, 18 inch, 30 inch, 42 inch and 52 inch hover. A few of the special points on this oil heated hover are as follows:

Burns Coal Oil
Steady Blue Flame
Comfortable and Easy to Operate
Economy of Operation
No Wick to Trim
No Oil Fumes
Visible Oil Feed
Convenient and Safe
No Coal, Smoke or Gas
The Flow of Oil Is Regulated Automatically.
Abundance of Heat

GROUND SQUIRREL WORK OF LARGE SCOPE

Figures of poisoning materials used west of the Mississippi River for the control of ground squirrels from July, 1918, to July, 1919, inclusive, are given by the United States biological survey as follows: Poisoned grain, 2,698,000 pounds; carbon bisulphide, 54,945 gallons; waste balls, 4,000,000; acreage covered, 5,645,000; total cost, $375,000; estimated saving, $3,375,000. Poisoned grain used in California (included in above), 1,138,000 pounds.

WAITE INSPECTS PIMA COTTON SEED

F. W. Waite, horticultural commissioner of Imperial County, has returned from Phoenix where he went to inspect the Pima cotton seed about to be shipped into the Imperial Valley by the Goodyear Company. The main purpose of the inspection was to make sure that the seed is entirely free from Johnson grass. Believing that proper inspection can only be made at the mills where the seed is prepared for shipping, Mr. Waite made the trip to Phoenix and thoroughly looked into the preparation as to every detail. This seed is now being shipped into the Imperial Valley for planting, Mr. Waite having secured the permit required by law of the state department of agriculture.

INCREASED INTEREST IN HIGH SCHOOL AGRICULTURE

According to present indications, there will be more applications from California high schools for state and federal aided agricultural departments than there will be funds available. A number of the high schools now maintaining non-vocational departments desire to change to a Smith-Hughes basis next year. Within the past week three high schools not now maintaining agriculture have indicated their desire to introduce that work on a vocational basis the coming year. There will undoubedly be many more such decisions made by high school boards before the opening of schools next fall. The problem of providing capable instructors is a serious one.

NOT CHARGEABLE TO FARMERS

The high cost of living is, of course, related to agriculture, but no more than to many other lines of activity.

Useless employes must be given an opportunity to become producers upon the farm or in the factory.

I am tempted to believe that the solution of the problem lies more in the hands of those interested in distribution and non-productive enterprises than in the hands of the farmers of the country.

It is not a satisfactory condition for the farmer to receive reduced prices for his pork, wheat, hides, while the prices of his machinery, lumber and shoes are raised.

The farmer asks that the laborers in the mines, the factories and the mills, who are also real producers along with the farmers, make an effort comparable to his to see there is just as little labor expense as possible in each article turned out by their hands, thereby helping the farmers of America, who in turn will help the laborer.

Attention must be given by public spirited citizens to the methods which tend to quicken and cheapen distribution of farm products, such as better terminal facilities, easier transfers, inland water transportation, back hauling, and roundabout routes eliminated.

Every person, no matter in what walk of life he may be engaged, should have a sympathetic, helpful interest in agriculture. — Secretary Meredith, U. S. D. A.

BROOM CORN AND OTHER PLANTS BARRED

Broom corn for manufacturing purposes may be imported hereafter only under permit and when its condition is such that it can be satisfactorily disinfected at port of entry, under a quarantine placed by the secretary of agriculture, effective February 21, 1920. Indian corn and certain related plants from all foreign countries are denied entry into the United States in the raw or unmanufactured state, except sorghum hay from Canada and the shelled or thrashed grain, from any country, of the plants included in the quarantine. The quarantine applies, in addition to broom corn and Indian corn, to such related plants as sweet sorghums, grain sorghums, sugar cane, Sudan grass, Johnson grass, pearl millet, Napier grass, Teosinte, and Job's tears.

The necessity for such a quarantine was demonstrated by the discovery of living larvae of the corn borer in some 97 bales of broom corn shipped from Italy to New York, the first considerable shipment of foreign broom corn since the war period. It has been definitely determined that the European corn borer, now known to exist in Massachusetts, New Hampshire, New York and Pennsylvania, originally reached this country through the medium of imported broom corn.

SHIPS MADE AVAILABLE FOR IMPORTING NITRATE

Indications are that enough Chilean nitrate will reach the United States to meet the nitrate requirements of American farmers for this season. The limiting factor was lack of tonnage to bring the nitrate-to American ports. The department of agriculture on February 7 placed before the shipping board the necessity for prompt action in making such tonnage available. A conference was held on February 11 between the shipping board and representatives of principal nitrate concerns and an agreement was reached under which the board agrees to furnish prompt requisite tonnage covering the period from now until July 1. After that date, according to the agreement, importers will submit their sales on the first of each succeeding month and the shipping board will enter into further engagements to supply the required tonnage.

Deliveries will be somewhat delayed for February and March, but nitrate concerns believe that they will now be able to handle April, May and June arrivals in such way as to clear up all deliveries that are behind and to take care of the forward business in good form. Indications are that importers will make deliveries in accordance with contract, subject to some possible delay during the next few weeks.

FOREST PROTECTION AND UTILITY

Regeneration of the forests of this country on a more productive basis is the most important measure for perpetuating the paper industry in the United States, according to the forest service. In the past forests have been cut extravagantly and little provision made for future growth. In the future operations should be conducted so as to secure an increasing reproduction of species available for lumber and pulp.

Fortunately such species as fir and poplar are prolific seeders and may be reproduced naturally without difficulty. Spruce may also be reproduced under proper methods of forest management. As the cost of pulp wood increases, investments in plantations, especially near pulp mills, would recommend themselves under a proper conservation policy. The production of large quantities of wood near the mills would greatly reduce the cost of lumbering and transportation, as compared with the expense of operating remote tracts that furnish a low yield of wood. Young, thriftily growing forests will produce yields scarcely imagined by one who has been accustomed to deal exclusively with old timber.

Unless this country quickly and widely adopts such reforms, its paper and pulp industry will be permanently crippled, the forest service declares.

"How I chose a power and light outfit for heavy work"

Western Electric Company,
Dear Sirs:

"When a salesman begins to tell me his article is the 'best on the market'—that's my signal to wish him a pleasant trip back to town. Looks to me as if he is more wrapped up in making a sale than in studying my needs and advising me what is best for me. That's my interest, and it ought to be his.

"Not long ago when I was in the market for a power and light outfit, I had the opportunity of seeing half a dozen plants in operation. Some of them looked pretty good to me, but as I never had any experience with an electrical system before, I was a bit puzzled.

"Then along came a salesman whose talk steadied me.

An outfit that can afford to be criticized

" 'You've been looking at some mighty good plants,' the salesman said, 'and probably wonder what I have to offer that is better. Now I'm not going to say that the Western Electric Outfit is the best. No plant is best for every purpose and every situation. But what is your purpose—light or power? If it is light, then I want to say that with the Western Electric Outfit, you get ample light, and something else in the bargain—extra engine capacity.

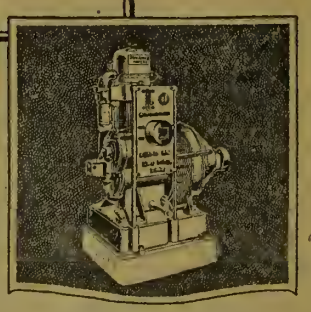
"He went on to tell me that the Western Electric people had gone in for power, plenty of power, believing that most farmers depend on power as a necessary aid in their work. And of course with a powerful outfit abundant light goes along without saying.

Ted Roush is a farmer known to his neighbors as a careful buyer. He looks before he buys any machinery, such as a Power and Light Outfit. So this letter that he wrote to the Western Electric Company—the actual experience of a real farmer—will be helpful to you if *power* is what you are looking for in your outfit.

Say "power" and you're talking the farmer's language

"Just then the Western Electric man caught sight of my grindstone, feed mixer and buzz-saw that I keep hitched up to the shafting down in the barn.

" 'See,' he said. 'Looks as if we figured right in your case too. What you want first of all is power—and I'm going to show you how the Western Electric Outfit can take care of this apparatus of yours.' "



Let the Western Electric Power & Light Outfit help solve your farm labor problem.

Ted Roush
Hillsboro, Ohio

"Then he showed me how I could belt the pulley to my shafting and without any trouble run the machinery. This can be done while the batteries are being charged, or it is just as easy to switch off the generator and deliver all the engine power to the pulley, at the same time you take light from the batteries.

How long do the batteries last?

Here's the agent's answer to that:

" 'The reason why our batteries last is because they are charged without strain. The charge flows in under fairly high pressure at first, but then begins to slow down gradually, so that when the engine stops itself the current is just trickling in. It is thanks to this automatic regulation that the batteries last longer.'

"I like that. But I don't want anybody to believe it because of what I have said. I think the only sensible plan is to see the outfit work, yourself. Then you can be sure."

Ted Roush

No matter what plant you finally buy, you'll be interested in some facts and figures that show just how electric power and light can help you in your farm work. Our booklet CC-2 tells the story. Write a postcard for booklet CC-2 to the Western Electric Company, Los Angeles or San Francisco.

Makes the Battery last longer

FEDERAL GRADES FOR WHEAT TO STAY

Federal grades for wheat will be enforced under the United States grain standards act after the United States grain corporation ceases to function. Reports have been received by the bureau of markets that farmers and grain dealers in some parts of the country are under the impression that the federal grades and the grain corporation will go out together. This rumor may be due to the fact that the grades went into effect at the beginning of the 1917 crop movement at approximately the same time that the food administration grain corporation began its control of wheat marketing. The grain corporation was created under a war emergency law. The law which empowers the secretary of agriculture to fix grades was approved August 11, 1916, and is a permanent measure.

STORAGE BATTERY TROUBLES

Loss of capacity in storage batteries usualiy comes from ciogging of the pores of the plates with sulphate which is not visible to the eye because the surface of the plates is maintained in proper condition, but the interior portions of the plates have not been thoroughiy reduced. This condition can be remedied, according to Prof. Foltz of the Colorado agricultural college, by prolonged overcharge at a low current rate—at about one-eighth of the normal eight hour rate.

Loss of active material will reduce the capacity of a battery. There is aiways a littie shedding of the active materials of the plates and this may be considered as normal, but when the shedding becomes excessive it indicates that the batteries are being discharged too much. The remedy is to maintain a higher degree of charge in the battery.

PLANNING GREATER CONSERVATION

Onder date of March 4 the Associated Press refers to action recently taken at San Francisco; also to present drouth conditions as follows:

"First steps to gather accurate, compiete information on the water situation in Caiifornia and to work out definite pians to alleviate drouth conditions, said to be the most critical in many years, were taken here today when various state and federai officials formed an organization, headed by E. O. Edgerton, president of the state railroad commission, to be known as the Emergency Water Conservation Conference.

"The conference will begin work at a meeting of representatives of the deita lands, which has been called in this city Friday, to assemble all data bearing on the water situation in their sections of the state.

"A second meeting wiii be held at Wiilows, March 10, and a third at Gridiey the foiiowing day. Following these sessions, which aii water users are invited to attend, Chairman Edgerton and his associates wiii give close study to the facts as brought out and later issue orders to water and power users.

"Those present at today's meeting included Chairman Edgerton, S. T. Harding, state engineer's office; Frank Adams and F. J. Veilmeyer, United States department of agriculture and University of California irrigation investigators; G. H. Hecke, state department of agriculture; C. H. Lee, state water commission; H. D. McGlashan, United States geoiogical survey; A. H. Palmer, United States department of agriculture; H. G. Butler, state power administrator; Lieut.-Coi. L. H. Rand, United States war department; C. H. Loveland and L. S. Ready, state railroad commission. Chairman Edgerton issued this statement:

"'Despite recent rainfall, drouth conditions in the state will remain the most critical in more than 30 years. Water users and irrigationists are warned against assumption that a sufficient water suppiy was made available by reason of the recent rain to relieve the water or power conditions throughout the state during the coming summer.'"

HOW TO TREAT CASES OF POISON OAK AND IVY

If one must handle these poisonous piants, gloves, preferabiy of rubber, should be worn. After the gloves have been removed they should be thoroughly washed with soap and water and rinsed several times. Inasmuch as the clothing which comes in contact with the leaves may be a source of infection for a considerable period, care shouid be taken in changing the garments and also the shoes. Many cases of poisoning have resuited merely from contact with exposed clothing.

One of the surest and best methods of minimizing or preventing infection after the hands, face or other parts of the body have been exposed, is to wash and rinse them repeatedly with an abundance of good kitchen soap and hot water. The poison, after being deposited on the skin, requires some time to penetrate, and if this penetration can be prevented by thorough washing, eruption and irritation will not result. While exposed parts should be cleansed in this manner as soon after exposure as possibie, it is worth whiie to make the attempt even 12 or 20 hours afterwards in the hope that at least a portion of the poison may be removed. A heavy lather shouid be produced and the washing continued several minutes. Severe scrubbing with a brush is not advisable, but several swabs of small compresses of gauze may be used, discarding each in turn, so that the poison may not be distributed by the cloth.

Bathing with alcohol diluted with an equal amount of water is also an effective preventive. Where exposure has been more general, a bath for the entire body, followed by a change of clothing, is a good preventive measure. The hair should not be neglected. Bathing, if not accompanied by sufficient changing of water or rinsing, may result in spreading the rash to skin that had not been infected.

Sugar of Lead Not Recommended

The investigators call attention to the fact that scores of remedies and prescriptions are more or less in popular favor, but in spite of the claims they assert that no specific treatment for poisoning from ivy and sumac is yet available. Ointments should not be used in the acute stage of the disease. In the later stages, however, soothing and astringent ointments may be of vaiue in allaying irritation and hastening cure.

The names "poison oak" and "poison ivy" are used interchangeably in many localities. The plant generally known as poison oak throughout the Pacific Coast occurs as a bush, sometimes four or five feet high, and has leaflets resembiing the leaves of the western oak, but it is also found as a vine, and is sometimes called poison ivy.

While many persons are of the opinion that contact with these plants is not necessary to produce poisoning, it is probabie that many cases supposed to have originated in this way have actually been due to direct or indirect contact. There are cases on record showing that the smoke from burning plants wiil give rise to irritation, and in some cases severe poisoning has resulted from this form of exposure.

Eradication should be followed up systematically. The simplest method is by grubbing, in which care should be taken to cover the hands properly, and also to prevent infection by means of the clothing. The use of kerosene is recommended where injury to other plants or trees is not to be feared. It may be applied with a sprinkler or a spraying pump, and in many cases one application is sufficient. Arsenate of soda has been used very successfully to kiil poison ivy on trees six to ten inches in diameter without injury to the trees, as well as on stone walls, buildings, and along fences.

A Machine that Solves Your Drainage Problem

The Austin Farm Ditcher, Terracer and Road Grader does many things and does them well.

It is unequalled for digging drainage ditches. It will dig a V-shaped ditch 4 feet deep, whose sides slope at an angle of 45 degrees. A ditch of this shape will not cave in or wash out. The Austin Ditcher will grade a road and keep it in repair. It will terrace hillsides so as to prevent soil washing and to make slopes hold moisture. Send for free literature.

PUBLIC HEARINGS ON PROPOSED RICE GRADES

Proposed federal grades for milled rice grown in the continental United States have just been published by the United States department of agriculture. Before these grades are adopted public hearings will be held by the chief of the bureau of markets, and growers, handlers, millers and others interested are invited to be present and make suggestions. These suggestions will be considered by the secretary in finally fixing official standards.

The idea of federal grades for milled rice is not new to the rice industry. In September, 1918, the department published a set of permissive standards which was adopted by the United States food administration and afterwards by various boards of trade and other grading agencies throughout the United States, but the grades were never enforced. However, they were the first standards in the United States which embodied definite factors of grading and are now in use to a great extent in the trade.

Public hearings will be held at San Francisco, March 17, 9:00 A. M., Chamber of Commerce, also in various other cities.

CALIFORNIA PINES TO BE CLEARED OF BARK BORERS

Realizing that the destruction of California pine timber by bark boring beetles is a serious menace, a menace directly comparable only to that of forest fires, District Forester P. G. Redington has arranged for control work looking to the eradication of these destructive insects in some 115,000 acres of government timber on the San Joaquin River drainage in the Sierra national forest.

The drainage of San Joaquin was chosen as the scene of operations because of its high timber values (nearly two billion feet of stumpage being involved), values which are now being depreciated by the bark beetles; because these areas of timber are so sharply isolated that the spread of insects into them from outside areas will thus be checked; and because owners of large tracts of private timber adjacent to the government holdings have agreed to cooperate by carrying on similar control work on their own holdings.

GOVERNMENT TIMBER RESERVED FOR SIERRA COUNTY COMMUNITIES

A total of 30 million feet of government stumpage directly adjacent to Loyalton and Sierraville, Sierra County, has just been withdrawn from the general market and will be held for purely local demand.

"The timber situation in the vicinity of Loyalton and Sierraville is rapidly becoming acute," said Assistant District Forester T. D. Woodbury, in commenting on the action of the forest service. "Comparatively large mills are now, and have for some time been cutting in this vicinity, but practically all the lumber so cut goes to the general market only. In addition, the forest service will henceforth refuse to allow logable, sound, saw timber in this locality to be used for firewood, even for local consumption."

READERS ARE USUALLY THINKERS

The practice of daily reading should be begun while in school and should not be discontinued later on account of lack of time. Thirty minutes a day spent in reading will keep one up with the current events and thus widen one's horizon. Thoughts may be gathered that will relieve the monotony and drudgery of the daily task. Reading not only adds to one's daily life but it paves the way for greater enjoyment later. It is as one grows older that the habit of reading becomes most valuable.

DINAH KNEW!

The new colored maid looked like a jewel—a real black diamond. The mistress, a very busy business woman spoke with an apologetic air as they entered the kitchen.

"I know this kitchen looks awful—"

"Laws, honey, don' you min' one minute. I'se used to white folks, I is," soothed Dinah.

CHARITY TODAY

"Have you any particular use for your old clothes?" inquired the charity worker.

"Indeed, I have," was the response, "I wear them."—Literary Digest.

Household Department

WITH ISHMAEL

Oh, hearths were made for stay-at-homes,
  Who build a little fire,
But feet were made for wanderers
  Whose ankles never tire.

And hands were made for those who love,
  And lips for love to press;
But feet were made for gypsy folk;
  We know no weariness.

For doors were made for householders
  Who sleep the night inside;
But feet were made of knowing flesh
  By flinty roadsides tried.

They say that arms are strong to hold,
  And yielding lips are sweet;
It may be well for sober folk
  Who have forgot their feet.

But I—I have a going foot,
  It will not let me stay;
I bid good morrow to my host,
  And buss his dame good day.

Ishmael had a going foot,
  Under a fairy spell;
And out upon the crags of life
  I camp with Ishmael.
—Willard Wattles, in Springfield Republican.

THE TWO PRETENDERS

THE morning sunshine streamed in through the windows of the hospital, and over little Victor Dubarre's bed. It gleamed on his black hair, and made the red blood glow through the clear olive of his cheeks. The smell of spring was in the air. It was a grand day!

Miss Jimmy almost danced down the corridor, but she paused to straighten the covers on Victor's bed, and fix the corners square with mathematical precision.

"Now you bad little boy," she begged, "can't you let it stay neat five minutes?"

Miss Jimmy's brown hair, under her starchy cap, was curly. Her blue eyes twinkled. Of all the nurses, Victor loved her the best.

"You mean," grinned Victor, "might I could lie still?"

He raised himself up, a rather difficult achievement, since the foot of his bed was much higher than the head, and waved his hand toward the open window with a wide gesture.

"But all the time go past automobiles, wagons, boys running, boys riding burros. Yes! How can I to lie still?"

She pushed him back onto his pillows with a little laugh, and hurried away. If there were tears in Miss Jimmy's eyes, she would not let Victor know it. For, to be sure, as Victor said, he had one good hip—just like anyone's. The other was quite different. That was the reason Dr. Coles had brought him to his hospital, and was making him lie in this tilted bed. That was why Victor was to wear a plaster cast for weeks and weeks after he left the hospital, and then come back again. When the other surgeons discussed Victor's "case," they shook their heads wisely and doubtfully, but Dr. Coles only set his jaw more firmly and said, "You will see." Of course, Victor did not understand much about it, but he knew that Dr. Coles was determined to make him so he could run and jump, even without a crutch.

As I said, it was a grand morning, still Victor was not very happy. His brown eyes moved restlessly. Then suddenly someone was coming up the stairs with quick, light steps.

"Oh, Doctor," Victor called eagerly, smoothing his hair.

"Hello, Vic," answered the surgeon, giving the boy's cheek a pinch. "My, but you look like a dude this morning."

"You mean—"

"You look like a sport."

"Oh, I watered my hair, yes. But Doc-tor, I got to tell you. I cross myself, like always, but also, me, I am a liar."

The surgeon laughed. "You are a liar?"

"Doc-tor, yes. I tell to Miss Jimmy, I tell to everyone, that I have a papa, a mama, lots of folks—and you know I have only but Jacques."

"Why do you do it, Vic?"

Victor frowned, but his dark, wistful eyes, steadily, unwaveringly, searched the surgeon's own.

"If I can to make you understand, Doc-tor. All the time, when I say I have no mama, and only but just Jacques left, all my friends say, 'Poor boy! Oh, such a little boy!'"

"Your friends, Vic? Have you so many friends?"

Victor's face was radiant again.

"In this hospital, even, about a hundred, I guess. All my nurses, the boy that brings the Denver paper, my friend in the wheeling-chair—"

"And you don't want them to pity you?" interrupted the surgeon.

In his earnestness the boy sat upright. His face looked proud, and his shoulders, beneath the hospital nightshirt, squared themselves.

"Me, I do not want them to be sorry, and so I lie." He spoke slowly, as though he were hunting for words to say just what he meant. "When I think to myself how my papa went back to fight for his France and died, I am glad, Doc-tor," he went on softly. "but you see, always when I say it to people they cannot to understand about how brave my papa was. They say, 'Oh, how awful bad!'"

Dr. Coles nodded. "I see, Victor." Then he folded his arms and thought a moment. "And your mother. You remember your mother?"

"Liken as I could forget!" he cried.

"You loved her, Vic?"

"I used to tell to her, 'As much as you are high, as much as you are broad, I love you!'" Slowly his eyes filled with tears, but he blinkel them back. "But my mama, she was very proud about papa, and she told to me and to Jacques, 'Like your papa died for France, it is for you to live for America.'"

Dr. Coles cleared his throat. "Vic," he said, "if you want to have a make-believe game and tell people about the family you used to have it won't hurt anybody.

"The first time I saw you, Vic, hobbling along on the depot platform at Basalt, I told you I would try to make you into a straight man, and I'm doing it. But I'm only straightening your body. Now, the real Victor, you'll have to keep him straight yourself—you and the good Lord. But make believe all the jolly things you want to."

Dr. Coles looked at his watch and snapped it shut again.

"Now I'm going to put a heavier weight on that rope, today, son, and raise the foot of your bed away up."

"Then," chuckled Victor, "Miss Jimmy will call me Victor-Stand-on-your-Head."

And of course she did.

That evening Victor was not sleepy, for the new weight felt very heavy, and something about the rope squeaked a little, whenever he moved. It was dusky in the corridor, with a sort of a subdued December sunset rosiness, for the only lights were the dim red ones marked "Exit." For all that, being wide awake, Victor saw them bring in the Old Aristocrat, and establish him at Twenty-eight. The hospital was crowded. That was why Victor's bed was out in the hall and the door of Twenty-eight was close to his bed. Victor did not know yet that he was the Old Aristocrat, but he saw that he was a sick old man, and rather cross. Miss Jimmy knew him, for he had been at the hospital before. In fact, it was Miss Jimmy who thought of this name for him. The others had called him Old Crosspatch.

"What is that squeaking sound? It annoys me," Victor heard him say to Miss Jimmy, and she came out into the hall.

"Victor, aren't you ever going to sleep?" she asked him, running her fingers lightly through his soft hair.

Victor giggled. "Tell the old gentleman, what squeaks so funny? Has he a little bird in there? Why doesn't he open the window and leave it fly out?"

"Sh-hush!" whispered Miss Jimmy. But the rope squeaked on rather more noisily than before.

The Old Aristocrat groaned ostentatiously a few times, and then went to sleep. After a long time the rope grew quiet, and Victor slept, too.

So at last it was another day, and the rope was rearranged so that the creaking stopped. Then came the boy who sold papers.

"What was I allus a tellin' ye?" he cried, gleefully, tossing Victor a paper. "Av coorse, your ould Franc eis afightin' all righter than iver, ye bet!"

Victor seized the paper joyously.

"But Dannie, no. It is not my France, really. I am for America."

HIGH-cost-o'-living has little terror for those wise housewives who appreciate the deliciousness and food-value of Ghirardelli's Ground Chocolate. They find it "rounds out" a meal that, with any other beverage, might seem a bit scanty. For it provides real nourishment—both as a food and as a beverage.

Never sold in bulk—but in cans only.
In ½ lb., 1 lb. and 3 lb. sealed cans—
at the store where you do your trading.

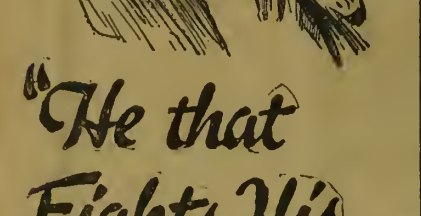
"He that Fights His Teeth's Decay will Live to Bite another Day"

As a safe, sane, efficient cleanser, Colgate's twice a day helps you to have sound, healthy teeth. And its flavor is delicious.

Colgate's is sold everywhere—or send 2c for generous trial tube.

COLGATE & CO.
199 Fulton St. New York



Common tea is half tannin and half poor tea-flavor. When you make it, the tea-taste develops first. It hardly gets going before the tannin comes along and smothers it. Tannin, the rank, harsh, injurious—what people use to tan leather with.

Try Schilling Tea, the tea with abundance of rich tea-flavor. You'll never go back to common tea.

There are four flavors of Schilling Tea—Japan, Ceylon-India, Oolong, English Breakfast. All one quality. In parchmyn-lined moisture-proof packages. At grocers everywhere.

A Schilling & Co San Francisco

Dannie grinned back at him. They were great friends.

All at once the Old Aristocrat's voice roared, "Bring me a paper, boy!"

The old gentleman was sitting up, wrapped in a lounging robe of very purple silk. He looked very dignified and handsome, but there was no friendly light in his dark, keen eyes. He did not seem to see Dannie's happy freckled face, or his hair that gleamed like a streak of warm sunshine.

Still Dan ventured a remark as he counted out the change.

"Mebbe ye'll be loikin' to read av the warr, yerself, sorr?"

"Like to read of the war—no!" boomed the old man. Then he went on drearily, "I am too old to fight? All I could give was money—and it is my France—France—France."

Victor gave a start. Was the old gentleman a Frenchman, too? He wanted to ask him, but there was something so forbidding in the way he unfolded his paper and held it before his face that he did not dare. Besides Dr. Coles came to show him a wonderful new brace that was to help make his body straight.

"Doc-tor, it shines like a sword, almost. And such a grand belt it has!" Victor was very nearly shouting. "Could I wear it now and go walking around?"

Dr Coles shook his head. "I want your shoe, Vic. I'll have this fastened to your shoe, and then—".

"I want to ask you, Doc-tor, is it that I can to go home tomorrow?"

"Possibly," said the surgeon, as he hurried away.

Victor frowned for a moment, then he ventured to call out to the Old Aristocrat.

"Do you know, please, what does 'possibly' mean?"

"It means," the old gentleman answered him whimsically, "might you could go, and might you could not go. Why do you want to go home?"

"To see Jacques," the boy answered honestly. Then he remembered his game, and he looked out of the window, and far away, where the distant purple hills touched the blue of the sky.

"I want to see my beautiful mama," he said, in a voice that was strangely happy, "and my brave papa." Then he laughed. "And to hear Louise and Jacques so mad because they have to wash and wipe the dishes, and to know does the baby cry all the time so funny."

The Old Aristocrat offered no comment, but for a moment the little wrinkles around his eyes twinkled, as though he were trying to smile—that was all. Victor settled down among his pillows, with the warm feeling of contentment that always came when he played his game. He did not even notice when the Old Aristocrat got up stiffly and walked to the door, where he stood looking down on the boy, with a strange, intent gaze. Just so had he often gazed, years before, at his own son, building lofty air castles of the things the boy was to achieve.

Something about the boy—perhaps the broad forehead, perhaps the soft curves of his red mouth, brought back the image of that other boy, and then, by a sudden trick of his brain, the picture changed. The old man saw his son again, not a laughing child, but a handsome, hot-headed youth, and he heard his own voice, scornful, bitter.

"So you are a liar? And you think I will shield you?"

Not until the words were uttered did he know that he had spoken aloud. Then the sight of Victor, with his face the color of ashes, and his eyes, staring, staring up at him, brought him to his senses. He had spoken in French, and Victor's knowledge of that language was already becoming hazy. But out of the jumble—"liar"—that word had leaped at him, like a red tongue of flame.

"You said?" he asked in a tiny voice, for his throat was tight and hard.

The Old Aristocrat, somewhat confused, laughed rather drily.

"I was talking to myself," he explained.

"You said liar," prompted Victor.

"Yes," the old man nodded, "I did. I had a son once—but he was a liar."

Victor swallowed painfully and wet his dry lips with his tongue. "Is he dead now?"

"What?" The Old Aristocrat crossed his room and stood looking out of the window, then he turned and came back to the door.

"I do not know," he finished quietly.

"He is not your friend?"

"I never saw him again."

Once more the old gentleman seemed to be talking to himself.

"He came to America. I thought he would come back—but no. And so I came. Twenty years is a long time to wait."

"I know," sighed Victor, "and you loved him."

"When I found he was a liar, there was only hate left in my heart. Only hate. 'A gentleman does not lie,' I told him. 'Our family never has and never will have a place for a scoundrel'. But now I am an old man."

Then he took his paper and began to read again.

At seven that evening, when Miss Jimmy came on duty, Victor called to her. As soon as she was near enough, he seized her and drew her down until his mouth almost touched her ear.

"Miss Jimmy," he whispered, "that old gentleman, he is my friend, my best friend now—and not mad any more."

Miss Jimmy laughed and pushed the hair back off his forehead in the way he loved so well. In his game he pretended she was his mother and that she leaned over and kissed his forehead. To imagine this more easily, he always shut his eye the instant her firm little hand touched his hair. When he opened his eyes this time, Dr. Coles was standing beside Miss Jimmy, and she was examining his new brace fastened now to his shoe.

"Vic," said the surgeon, "Miss Jimmy will help you put this on in the morning. How will that suit you?"

"Oh, but thank you Doc-tor. I want to know—might I can have my clothes?"

"Surely you may, son, and here is your new crutch. It's two inches longer than your old one."

Then as usual, Dr. Coles hurried away. He was a busy man. In 28, he found the Old Aristocrat quite talkative—almost good-natured.

Miss Jimmy went away, too, and then, all at once, Victor knew that Dr. Coles and the old gentleman were talking of him.

"Yes," Dr. Coles was saying, "Victor Dubarre has the bravest heart—"

"Victor Dubarre, you say?" the old gentleman cut in. "Fool that I am, not to have known it. I never asked him his name."

His tone was shrill and excited for a moment, then it dropped again, and Victor heard their voices only as a drone of meaningless words. It must have been an hour later when he heard the Nicest Interne talking to Miss Jimmy. just at the head of the stairs. Victor had been lying with his eyes shut for a long time, but he was as wide-awake as ever.

"So," said the Interne, "it's true. Your Old Aristocrat is Vic's grandfather, but Vic isn't to know it till tomorrow."

"Oh, I am so glad!" Miss Jimmy cried softly. "Victor can have just anything in the world that he wants—" She stopped with a little catch in her voice. "I mean that money can buy him."

"Poor little kid!" sympathized the Interne.

(To be Continued).

SPRING HOUSE BRIGHTENING

We don't say spring "house cleaning" for, especially here in our sunny state we have opportunity to sun and air and clean all through the elsewhere shut-in months.

But when the new leaves begin to come and the fruit trees bloom and the mocking birds and the meadow larks tell us that spring is here, instinctively we begin planning to freshen and brighten our homes as we freshen and brighten our clothing.

A little extra cleaning of course is the first part of the brightening process, but cleaning won't do it all. Don't forget the need of a coat of paint. Sometimes we clean and clean and grieve over the dingy spots when a very small investment in paint and brush and elbow grease would correct the dinginess and make the housekeeper happy. There are so many prepared paints and stains and enamels all ready for use in cans containing from a half pint up that there is no need for hesitating at the thought of work or expense involved.

You will find that grocery, general and drug stores carry these small cans of paint, as well as the regular

Grateful Live Stock

—kept contented and free from lameness, stiffness, bruises, aches and pains by a little Sloan's Liniment when necessary—increase production, do better work, enhance in market value. Apply it to the swelling, strained tendon, or other afflicted part *without rubbing*, for it *penetrates*, scatters congestion, brings comforting, speedy relief. Three sizes at all druggists, the largest for greatest economy—35c, 70c, $1.40.

Sloan's Liniment Keep it handy

Raise Guinea Pigs FOR US

We supply stock and buy all you raise. Laboratories need thousands, big money, easy to raise. Particulars and book 10c, nothing free.

DR. J. A. ROBERTS LABORATORIES Hollywood, Cal.

The advertisers in the California Cultivator are known to be reliable and we recommend them to our many subscribers.

paint shop which may not be accessible.

Also if the paint now on the wood work is not of a pleasing shade it is perfectly practicable to paint it white or cream or any lighter shade—if you use at least three coats, and often the extra expense and labor is more than justified.

And another thing, it isn't in the least bit necessary to wait until your husband can find time to do the work. Just go at it yourself; it isn't half so hard as washing clothes or scrubbing floors, and a heap more interesting.

For the last coat, enamel may be used instead of paint, but it is thicker and more difficult to apply. If used, care should be taken to get it on evenly, not leaving drops of it standing on the surface.

If one does not care to attempt the use of enamel a very satisfactory finish may be obtained by applying flat varnish over the last coat of paint. This produces an effect similar to enamel and is more easily handled.

Woodwork should never have a highly polished surface. Therefore, be sure, in selecting your enamel to get one with an egg shell or satin gloss finish.

An interior finished in this way should be attractive and easily cared for. The floors and woodwork may both be wiped off with a damp cloth without injury to the finish. A little kerosene sprinkled on the cloth is very good for taking up dust and if one wishes to wash the floors, the addition of kerosene to the water facilitates the cleaning.

As to hardwood floors, the oil mop used carefully once in two weeks will soon establish a rich and satiny finish and with the daily brushing be kept in perfect condition.

Then comes the question of fresh curtains and draperies. Never were such alluring patterns shown in cretonnes and tapestries and voiles, and, alas! never were such prices tagged upon them. But the careful shopper may even circumvent this difficulty with ingenuity and dyes and stencils.

Take a look over your house this morning with the eyes of a visitor and see what is needed to make it a brighter, homier place. Or if you have already done your spring brightening write to the Cultivator Household Department what you have done and how you did it and how the family likes it and—if you don't mind telling—how much it cost, and was it worth it.

Your experience and the telling of it may give some of the rest of us just the inspiration we need to brighten up our homes, so don't feel the least bit of false modesty in telling just what you did. If you prefer we will not publish your name, but in these days when women have dropped the clingy vine idea and vote and wear short skirts and join farm bureaus and sometimes farm themselves, why shouldn't we say "My name is Mary Jones, what's yours?"

The pages of this department are always open for your expression. Now let this be a special call for ideas.

Household Contest

For best letter on above topic, $2 cash; second best $1.00; all published one year's subscription to California Cultivator.

Please write on one side of paper only.

Letters should be addressed: Household Department, California Cultivator, Los Angeles, and should be mailed by Saturday, March 20. They will appear in the first issue in April.

With your letter send name and address to which you wish subscription credited.—R. P. D.

THE IRONING BOARD FINDS A HOME

Last week I visited a young housekeeper whom high rents in the city had driven to a home of her own in a small town. It was an unusually attractive bungalow with all the closets and built in features heart of housewife could desire. She was proud of them all, but in the kitchen where she exhibited the ironing board which had a cabinet closet of its own with electric plug for the iron her eyes shone with such pride and satisfaction that it was a lovely thing to see.

And why not a real out-of-the-way-of-everything-else place for the faithful ironing board? Haven't we all packed it away behind the pantry door or hooked it up against the wall of the back porch only to have it assert its helplessness and fall sprawling in the way at hurried and worrisome times?

This particular ironing board was built in to a wall cabinet between the back door and the broom closet at the end of the sink and drain board. When dropped in place it faced the windows over the sink and had at its left the light from the glass door or the open door in warm weather.

This particular board had supporting framework that made it adjustable in height so the cabinet was built with the bottom near the baseboard, and fitted into the back of the cabinet with screws two stiff steel round rods each two feet in length. To the base end of the ironing board were fitted two stout screw hooks which engage these two rods, serving as a hinge in lifting the board into the cabinet for storage and holding it steady for use.

The board slides up or down upon these iron rods to suit the adjustment for different sized persons and when stored settles to the bottom of the rods. It was placed upon hooks instead of eyelets that it might at any time be detached and removed for use to any other part of the house if necessary.

A shelf near the top of the cabinet serves for storage of irons, holders, etc., and a small drawer beneath holds starch box, ironing waxes and other articles needed on ironing day.

It's just one of the little things that mean a great deal of economy in health and happiness.—R. P. D.

CHEESE ADDS SAVOR

Cheese is particularly appetizing in the early spring days. A little added to creamed tuna or chicken or chipped beef makes a very rich and satisfying dish for supper with hot biscuits or toast. Here is a way of using it with corn meal which is new to many:

Corn Meal With Cheese

Cook enough corn meal to spread thin over two pie plates and put dabs of butter on it. Cut the corn meal in both plates into eight or ten triangular pieces of the same size, then grate the cheese, sprinkle it thickly over the butter and sprinkle paprika over it. Lay the second layer of corn meal over the first, taking care to see that each slice fits exactly over the slice under it. Spread butter on the corn meal, grate cheese over it, and bake the dish in a very hot oven until the cheese is soft. In Italy corn meal is often served in this way.

Cheese and Pimento Salad

A very quickly made and delicious salad. Place lettuce leaves on salad plate, a whole canned pimento, a square of yellow cream cheese, over all French dressing made of two tablespoons oil, tablespoon vinegar, Worcestershire sauce and salt to taste.

Cheese in Cream Sauce

Add a little grated cheese to white sauce for meats or vegetables. It gives savor—and it's a change.

Cheese and Onion Sandwiches

Some night for supper or some noon for luncheon serve cheese and onion sandwiches. They are almost a full meal in themselves.

Spread one side of bread with cream cheese, the other with butter—and don't spread either too thin. On one side put finely cut onion, on the other a lettuce leaf or canned pimento and press together.

Cheese in Chowder

Add a bit of cheese to clam or potato chowder, to any cream soup, to stewed tomatoes, corn, beans or peas.

Cheese With Bananas

Cut slit lengthwise in banana skin, force into it a long wedge of cheese, sprinkle salt over it and a little lemon juice, bake in oven ten or 15 minutes. —R. P. D.

TALKING IT OVER

He was a new hand, from the big city.

"Jim," asked the farmer, "have you fed the horses?"

"Yes, sir."

"What did you feed them?"

"Hay."

"Feed the cows?"

"Yes, sir."

"What did you feed them?"

"Hay."

"Did you feed the ducks?"

"Yes, sir."

"Well, what did you feed them?"

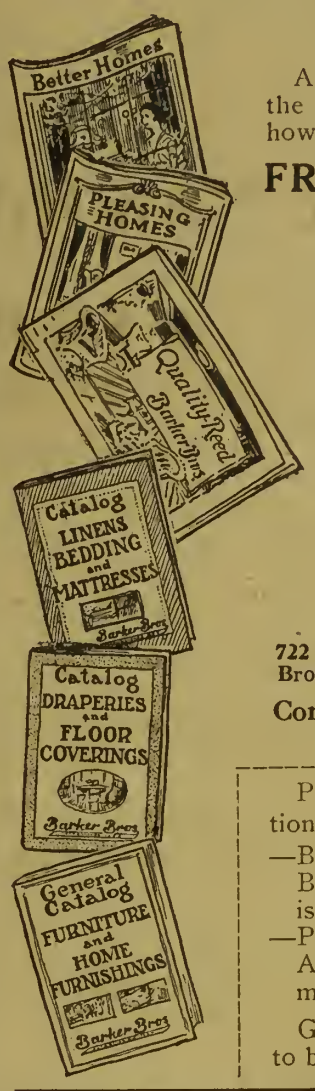
"Hay."

"And did they eat it?"

"Well, no sir, not exactly, they didn't as far as I noticed—but they was talkin' it over when I left."—Ex.

Study of Furniture and Home Furnishings

---The First Necessity in Making a Successful Home



A successful home is the result of doing things the right way. Knowledge of what to do and how to do it is the necessary guide.

FREE Books of Furniture Styles and Fashions

These illustrations show a few of the many fascinating, interesting magazines and booklets and catalogs issued by Barker Bros. and sent Free on Request.

To the home-furnisher they are as enjoyable and necessary as Style and Fashion books to the home dressmaker. They are full of ideas—they teach ways of making rooms cheerful — they show how to select Rugs, Furniture and Draperies for desired effects —they will help you make the most of the furniture you now have.

They are FREE for the ASKING. All you need do to get them is cut out the coupon below, fill in the blanks and send to Dept. D.

722 South Broadway **Barker Bros** ESTABLISHED 1880 Los Angeles Cal.

Complete Furnishers of Successful Homes

Cut Off Along This Line

Please send me the following FREE publications:

—Better Homes. Beautiful magazine issued quarterly.
—Pleasing Homes. A splendid monthly magazine.
—Catalog of Quality-Reed Furniture.
—Linen-Bedding-Mattress Catalog.
—Drapery and Rug Catalog.

General Catalog of Furniture and Furnishings to be issued in Spring. See later announcements.

Better service is assured by the advertiser if when writing you mention the California Cultivator.

THE FISK RUBBER COMPANY

OF NEW YORK

FISK TIRES

TIRE SUNDRIES

CHICOPEE FALLS, MASS.

PLEASE ADDRESS REPLY "ATTENTION OF

TO THE CAR OWNER:

I wish it were possible for me to meet you personally, to say directly to you some of the things I would like you to know.

If you could conduct an investigation as to which tire commands the greatest good will of its users I honestly believe you would find it to be the FISK.

In the first place, the tire is a good one. I not only think that but I know it. It is built to a high standard. The quality and construction are right and the types of FISK TIRES are generously oversized.

While FISK TIRES are sold through dealers only, we have a big chain of our own branches, one hundred and forty of these being so distributed that all dealers in the United States are within quick reach of Fisk fresh stock.

Each one of these branches is in charge of a Fisk man who is on his tip-toes to see that all dealers and users in his territory are pleased with FISK TIRES.

In direct distribution facilities and in our attitude to our dealers and to you who use tires, we have a place distinctly our own.

In volume of production and in years of experience we are among the small group that leads the whole tire industry.

I personally have seen, in my twenty years' association with The Fisk Rubber Company, its business grow from two-thirds of an acre of floor space to thirty-one acres of floor space and from an annual business, in 1900, of less than $90,000 to very close to $50,000,000 in 1919.

Our Ideal, - To Be The Best Concern In The World To Work For and The Squarest Concern In Existence To Do Business With, - is a true indication of our aims and policies.

Ask your dealer about Fisk Tires.

Very truly yours,

E. H. Broadwell

EHB:M Vice President & Gen'l Manager.

Hold the Floods in the Mountains

By C. B. Messenger

SINCE early mining days the control of the floods, the preventing of filling of streams with mining detritus, the distribution of water for mining, for power, for irrigation, and for domestic use have been questions of great moment to California and the answering of them has received more attention this year than any preceding year in the state's history. Had the wild dream, discussed at times for a period of many years, been enacted into a reality, the crops produced, the comfort added, and the power supplied for the industries of the cities this one year would have paid the ten millions per year which was suggested should be invested in the Sierra Nevada; damage from floods of former years would have been prevented and their waters would have been available for release this year.

Stream Gauging Stations in Los Angeles County Mountain Watersheds
These and other stations are maintained through cooperation of Federal Weather Bureau officials, State Water Commission and various counties of the state. They will furnish data for later impounding or other conservation.

The scheme called for impounding dams, for spreading of waters over gravel beds, for reforestation, for every step which would retard water and prevent early melting of snow; also for great high line canals skirting along the foothills of the Sierra Nevada from Shasta to well towards Tehachapi. South of Tehachapi there was no such opportunity, though similar plans were suggested for the waters of the Colorado. The scheme was too big; the opportunity was not grasped, and even these dry years fail to give much intelligent discussion to it, or to a better scheme.

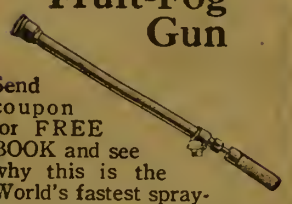
However, every year sees a straightening and deepening of channels to the ocean. The wealth giving waters are speeded on their way rather than retarded. All of Southern California is now engaged in this disposal of her flood waters. It seems necessary if property along the banks of the arroyos and streams is to be saved, but may we not pause a moment and discuss the claims of the careful observers. What are reforestation committees, boards of engineers, counties associations, federal and state officials and others urging upon us?

All are not given the natural opportunity afforded to irrigators on the great alluvial fan which lies at the mouth of San Antonio Canyon above the Pomona-Ontario section. For nearly a score of years these irrigators have taken the flood waters and distributed them over this great bed of gravel and boulders lying from a few hundred feet to several hundred feet above the great tillable valley. These waters have filled the gravel beds underlying the valley and given assured summer irrigation and even made safe the domestic water supply of several small cities. In addition, since the days when T. P. Lukens tramped the mountains and appealed to the people to begin reforesting operations there has been occasional warning to flee the flood to come. But this reforesting, this spreading of the waste waters, is the mere beginning. Let us awake. Our land resources are vastly greater than our water resources. Stop the floods wasting into the ocean.

W. A. Johnstone of the state water commission gave in last week's Cultivator an idea of some of the work now being done in the gathering of data which will afford opportunity— (Continued on Page 483.)

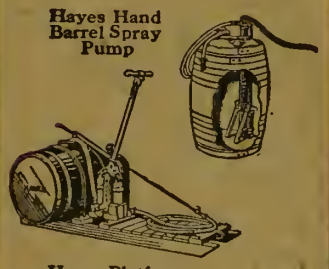
America's Foremost Spraying Apparatus

HAYES Fruit-Fog Gun



Send coupon for FREE BOOK and see why this is the World's fastest spraying apparatus. The only gun which combines great speed with the thoroughness of Fruit-Fog. One man handles capacity of big power sprayer. Does four days' work in one. Simple twist shoots long spray to top of tallest trees, or gives wide spray for close-up work, or shuts off tight and prevents waste of solution between trees. Mechanically perfect and fully guaranteed. Get the book for full details.

Hayes Hand Barrel Spray Pump



Hayes Platform Duplex Hand Sprayer

Hayes High Pressure Triplex Power Sprayer

Nation-Wide Service

Users of Hayes Power Sprayers are within only 24 hours of a service station at all times. In case of accident at a critical time this quick service may save your fruit crops. Hayes Power Sprayers, Engines and Repairs are distributed by

Fairbanks, Morse & Co.

Atlanta	Los Angeles
Denver	San Francisco
Jacksonville	Seattle
Portland	Spokane

Salt Lake City

We Also Maintain Stocks at

Flora Dale, Pa.	Philadelphia
Kansas City	Little Rock
Grand Rapids	Albion, N. Y.

Hayes Hand Sprayers are distributed by Hardware, Implement and Seed Jobbers

Send for the Startling Story of Fruit-Fog Spraying!

FRUIT Growers and Farmers should beware of life-sucking, profit-stealing pests this year. Reports say their ravages are more terrible than ever before in some sections. Send the coupon for Big New FREE Book and Valuable Spraying Guide now. Get all the *new facts* on spraying before it is too late. Learn, for example, why Fruit-Fog—the vaporous super-spray—is the ONLY spray *fine enough* to penetrate into the microscopic niches in bark, buds and foliage—where *millions* of UNSEEN deadly pests hide—and where no coarse, heavy, low-pressure spray can reach. This explains why ordinary spraying often fails. Also why Fruit-Fog Spraying has been pronounced a phenomenal success by Experts, Experiment Stations and Fruit Growers everywhere. Fruit-Fog positive *thoroughness* is the direct reason for the *big crops* and *big profits* that have made Fruit-Fog Spraying famous. Send the coupon now.

HAYES FRUIT-FOG SPRAYERS

The Hayes scientifically atomized, fog-like spray is produced by Hayes guaranteed 300 lb. pressure and the scientific Hayes nozzle. Its vapory fineness gives Fruit-Fog remarkable adhering powers. No drops form—no solution wasted—no buds or leaves knocked off—as with coarse, heavy, low-pressure sprays.

Hayes Fruit-Fog Sprayers are positively standardized in every part. They are skillfully made in a way that insures enduring service and greatest efficiency under high pressure.

To assure Hayes Fruit-Fog users the best possible engine service, we have selected the famous Fairbanks-Morse "Z" Engine as standard equipment.

Sprayers for Every Purpose

There are Hayes Sprayers for Orchards, Gardens, Field Crops, Vineyard, Nurseries, Cemeteries, Greenhouses, Shade Trees, Potatoes, Cotton, Flowers, Alfalfa, Sugar-beets, Poultry and Hog Disinfecting, Whitewashing, Cold Water Painting and every other known use.

No matter what your sprayer needs, from our great Triplex Fruit-Fog Power Sprayer to the smallest Garden Atomizer, we make it.

Send the Coupon Today!

Tell us how many trees you want to spray and how old they are on the average. Also what other uses you have for your sprayer. We'll tell you where and how you can get the style of Hayes Sprayer best suited to your needs, and its price. We'll also send our Big New Book of Hayes Sprayers and Valuable Spraying Guide FREE. Send the coupon today.

HAYES PUMP & PLANTER COMPANY
Dept. D, GALVA, ILLINOIS (44)

Send for Big Spraying Book FREE!

The book pictures and describes the Fifty Styles of Hayes Sprayers. Tells why the deadly pests that infest your Fruit, Potatoes, Hogs, Poultry, etc., cost you more each season than several Hayes Spraying Outfits. Proves that these destructive pests are costing American Farmers and Fruit Growers an *appalling toll*. Shows how thousands of owners of Hayes Sprayers have *stopped these losses*—and turned them into *big profits*. Send the coupon now and get the FREE BOOK.

Valuable Spraying Guide Also Sent FREE!

This Spraying Guide tells you, in simple, handy form, how to recognize and kill every known pest that infests every fruit and other crop, also every animal on your place. Tells what solution to use—how to mix it—how and when to apply it. Worth hundreds of dollars to any Farmer or Fruit Grower. Send the coupon and get your copy FREE.

Vol. LIV, No. 12 Los Angeles, March 20, 1920 One Dollar Yearly

California, Greatest of Alfalfa Growers

By C. B. Messenger

"MR. MILLER, how did you do it?"

"When was the seed planted?"

"Did you fertilize the ground?"

"Was the land tiled?"

"Was the seed drilled or broadcasted?"

"How many cuttings did you make during the year?"

"Are there any weeds in your field?"

"Did you inoculate seed?"

"Now, wait a minute, Mr. Messenger; I am not in the habit of taking government contracts, and your questions are rather too numerous for intelligent answer all at once."

We have always taken it for granted that California produces the biggest and best crops of everything, especially alfalfa. Some of the first crops produced in North America were grown in this state, and yet, when it was announced that the greatest tonnage per acre of alfalfa on non-irrigated lands of the United States was produced in the little Chino Valley of San Bernardino County, all we Californians were still somewhat surprised and highly gratified. Hence my flood of questions. I wanted to know for Cultivator readers the how and the why and the when.

It was early one morning last week that I drove out to see the wonder field, and as a Californian looks at things it was no wonder after all. It was simply California alfalfa, grown on California soil by a California farmer. There were some weeds, mostly malva; there was here and there a gopher, and yet, on this fifth day of March there was alfalfa ready for the cutting, the first one of 1920, nearly a month earlier than the first cutting of the prize winning crop of 1919.

But as common as it all appeared, as one looked over the field of beautiful alfalfa, the story as outlined by Mr. Miller was one of intense interest. So far as I have heard he was the only competitor from this state. Before the war ended, an Eastern farm paper, the Farm Journal of Philadelphia, determined as a part of its work in spurring up war time agriculture, to offer prizes for the biggest and best crops of corn, cotton, wheat, potatoes, oats, and alfalfa, these crops to be harvested during the year 1919 and on lands which were not irrigated. Mr. Miller entered the contest. California seemed to be handed this left-handed one: "As a compliment to irrigation farmers, they are not permitted to compete, because they can generally excel non-irrigation growers." But California has some lands which may not receive a drop of rainfall for six or eight months and yet are such wonderful water holders and of such wonderful fertility that they still produce great crops. The lands of Mr. Miller are on the lower slopes of the great plain which extends from the Sierra Madre in the neighborhood of San Antonio Canyon south and southeast toward the Santa Ana River. The soil is a rich sediment of great depth. The particular field from which was cut this prize winning crop of all America grew crops of sugar beets for six years without rotation prior to 1916. Mr. Miller then determined to give it a trial at alfalfa. There were two or three alkali spots or damp places which were reclaimed by laying five to eight inch tiles in a six foot ditch and carrying these tile lines to the district outfall.

America's Biggest Tonnage Non-irrigated Alfalfe Hay.

N. W. Miller of Chino, taken in the alfalfa field which won a $1,000 cash prize and a gold medal for an average yield of seven tons, 748 pounds per acre, or 37 tons, 903 pounds in the five acres entered in the contest, in the season of 1919. This photograph was taken by a Cultivator photographer March 3, 1920 and shows the alfalfa growth nearly 30 days ahead of last year's. Mr. Miller is accompanied by his little grandson.

Following removal of the last crop of sugar beets the land was disked, seeded with something over 15 pounds of seed per acre, broadcasted by hand, and lightly harrowed in. This was in the late fall, November or December of 1916. The first year's crop was good; the next, that of 1918, was much better, in fact, Mr. Miller thinks far greater in tonnage than the prize wining crop of 1919, for the rains of the fall of 1918 and winter of 1919 were lighter than those of the preceding year and much lighter than those of the present year. This drouth, together with the cold, prevented early cutting; the first was in April. Other cuttings were made at regular intervals until the last, which was in November. Each weighing was in the hands of a committee of three. The manner of their work is explained below by Mr. Condee, who was one of the committee. But, in a word, a careful measurement was made of exactly five acres. Every load taken from that five acres was driven to the scales on the ranch. A specimen of the hay was tightly corked in glass container which was forwarded to the University of California to determine its moisture content. Twelve and one-half per cent of moisture was permitted, or, rather, was the basis for determination under the rules of the contest.

After the November cutting and weighing by the committee, reports

(Continued on Page 512.)

The Chili Pepper Outlook

By Ernest Braunton

FOR a few days or a week the chili pepper industry is hanging in mid-air, so far as gross acreage is concerned. A considerable crop will be planted, no matter which way the pendulum swings, but if the swing is to the right the area of planting will possibly be extended over that of last year. If plans do not miscarry a representative of the growers is already speeding eastward, and when he reaches enough big market points he will wire to plant or not to plant.

For the past three years the pepper lands have produced below the normal crops. The soils are getting "old" in this crop and some return must be made if normal production is to be maintained. And fertilization is dependent uopn the contract price for the 1920 crop, and the deal must be closed quickly, for the planting season is at hand. Last year the growers were paid 16 cents a pound for their crop, but between the contract of spring and the harvest of autumn the cost of production had increased about two cents a pound. The grower must have from 18 to 20 cents a pound for the 1920 output before he is assured of a fair chance for profit, for he fears a still further advance in cost of production. To present date the Eastern buyers will not meet these prices, and if the representative speeding toward New York cannot induce them to "come throngh," he will wire back "no planting" and the acreage will be light.

Planting Operations

Great care is taken by the individual planter in the selection of his seed peppers, for upon the standard of his crop depends whether he receives the full contract price or if that price is cut slightly because the product is not up to specifications. So he goes through his fields when plants are in prime condition and places a stake by every plant that is of proper shape, has the right foliage, and good size, form, and color in the fruit. From these plants come the seeds for the next year's crop. This close selection is maintained each year and to this practice is ascribed the fame California enjoys for producing the 'world's best peppers.

The best time for planting ranges from March 20 to April 10, dependent upon temperature and rainfall. In former days seeds were planted in seed beds and the young plants removed when three or four inches high. But the present practice is to plant in the field where the plants are to grow. So it is drilled in rows from 44 to 48 inches apart and when plants are well up they are thinned to 24 to 30 inches in the row. At the same time, if plants are lacking in quantity the better and stronger of the thinning is used to fill the vacancies. The amount of seed sown per acre is about two pounds, covered one to two inches, according to texture of soil.

Intensive cultivation is the price of a good crop of chilis, and nothing yet discovered or devised will take its place. The young plants must be kept free from weeds and the soil constantly stirred. Once a week is the rule laid down for cultivation and in a good soil for peppers once in two weeks is enough of irrigation. In loose, sandy soils the plants will be thirsty every ten days. Fertilization is necessary, especially in the older and more constantly cropped fields, and present knowledge points to fish meal as the best foundation. To this some growers add ten per cent nitrate of soda and the different applications have quite a range in mixture, dependent upon nature of soil and results obtained by the individual in feeding experiments.

Growers interviewed by the writer are still, for the greater number, shaking their heads or shrugging their shoulders when asked if they will plant peppers this year. One man who grew 90 acres of them last year has already contracted with a sugar factory for a beet crop, and many smaller growers have done likewise. The next ten days will settle the question of acreage. J. A. Knapp of Garden Grove, one of the most extensive handlers, and who shipped 50 carloads of chilis the past season, told the writer that he expects to leave for the far Eastern markets to interview the big buyers in a few days. If he reaches a point where negotiations justify, he will wire back the single word "plant." If he does not, the reader knows just as much about the situation as the Cultivator.

Agricultural News Notes of the Pacific Coast

Northern California

A hop ranch recently sold near Mendocino for $130,000.

State farm bureau membership now exceeds 20,000.

Asparagus shipping has begun from the Sacramento delta district.

Humboldt County will vote on a $500,000 bond issue to "save the redwoods."

The March meeting of the Chico farm bureau will discuss irrigation of orchards.

Petaluma poultry district has a poultry adviser with permanent office at Petaluma.

The farm bureau of Oak Park, Yolo County, is planning to establish a marketing department.

Orland irrigation farmers are endorsing forest patrol and better protection of the watersheds.

A tractor school will be held at the Napa high school. Fifty farmers have already enrolled for the course.

Placer County farm bureau meetings will be held at Applegate, March 15; Weimar, 17; Roseville, 22; Colfax, 24.

Prof. Elwood Mead, chairman of the California Land Settlement Board, has established a home at Cloverdale, Sonoma County.

The state railroad commission has issued an appeal to all water users of California to join in a "save the water" movement.

Rice growers of the Sacramento and San Joaquin Valleys are guessing as to what drouth conditions will allow them to do he coming season.

The wool growers of Mendocina County are planning to pool their fall clip through the farm bureau sheep department. They are holding for 50 cents.

Articles of incorporation have been filed by the Pacific Rice Land Company, composed of Japanese, who will operate at East Nicolaus, Sutter County.

The state highway commission has ruled that irrigators may not make use of state highway drainage structures to carry irrigation water across state highways.

The Cone Ranch Company of Red Bluff, Tehama County, is feeding corn to sheep on the range, in order to give the ewes milk enough to raise their lambs.

A San Francisco concern is suing Chico rice company, the point at issue being as to whether title to rice passes as soon as price is named and agreed upon.

Prof. C. M. Packard, in charge of the United States bureau of entomology field station, is affiliating with the state department of agriculture in entomological work.

A sheep growers department of the Mendocino County farm bureau was organized last week at Anderson Valley. It is hoped to extend the activities of the organization to wool men of all Mendocino County.

Seventy-five stockmen of Contra Costa, San Joaquin and Santa Clara Counties met at Livermore under the auspices of the Livermore Stockmen's Protective Association to discuss necessary steps should they be obliged to ship their cattle to pasturage in other states. The meeting appointed a committee consisting of H. P. Holley, Patrick Connelly, J. L. Moy, Joseph Concannon and James Gallagher to make full report of the situation.

Central California

Fresno reports serious inroads from early cutworms.

Farm bureau meeting will be held at Lodi, March 27.

San Joaquin County's farm bureau membership totals 642.

Terra Bella, Tulare County, will plant largely to long staple cotton.

Grape growers near Clovis, Fresno County, anticipate large grape crop.

A new roller gin has been installed at Kearney Vineyard, Fresno County.

Estimate for Melones reservoir for the Oakdale irrigation district is $1,750,000.

Site has been selected for California Cooperative Cannery plant at Terra Bella.

It is rumored that Gilbert Daniels will succeed Harris Weinstock as market director.

The new dried milk plant at Tranquillity, Fresno County, is now making carload shipments.

A maturity test is now suggested for olives by the United States department of agriculture.

Kings County has completed a fine concrete bridge over the Kings River, connecting Hanford with Kingsburg.

Irrigators in the San Joaquin Valley have been given temporary relief from the power shortage by the recent rains.

San Joaquin County irrigators are discussing flood control projects, especially that of the headwaters of the Calaveras.

Settlers on the West Side are endeavoring to secure an irrigation district covering lands located in Kings, Fresno and Madera Counties.

Farmers of Merced, Madera, Kern, Kings, Tulare and Fresno Counties are protesting through their farm bureau organization against increased power rates.

The farmers union of Stanislaus County has adopted strong resolutions condemning sale of land to Japanese as "detrimental to the best interests of the community."

The senate public lands committee has reported favorably on Senator Phelan's bill to enlarge the Sequoia national park and change its name to Roosevelt national park.

Report comes from France that buyers are already offering as high as 15 cents per pound dried for wine grapes, and digging up of wine grape vineyards has been stopped.

The annual farm bureau traveling conference begins at Berkeley this week and will continue with a trip through the Sacramento Valley until April 3. The trip will not start until March 29.

An orchardist has discovered method of oak root fungus control. It consists of stripping roots of trees which are near the surface and saturating ground with solution of cyanide of potassium, one ounce to ten gallons of water.

Judges Wallace and Allen have filed an opinion ordering that a Japanese guardian of two minor heirs be removed from guardianship because the Japanese has farmed the land as his own, making contracts without authority of the court and committing other acts which indicate that his guardianship was merely to evade the alien land law.

Southern California

Orange County fair is scheduled at Huntington Beach, October 7-9.

The Citrus Association at Tustin is increasing its acreage of lemons.

San Dimas marmalade factory contemplates increasing its capacity.

The new berry container adopted by the California berry growers will contain 12 ounces.

The Orange County farm bureau will hold its annual picnic on May Day at Orange County Park.

The farm development bureau of the Goodyear Tire & Rubber Company is urging the value of diversified farming.

The Oxnard drainage district, Ventura County, will soon begin construction of portions of the drainage system.

The San Fernando Valley water consumers are working through the farm bureau to secure a reduced winter rate.

Farm Adviser Walberg of Orange County reports highest value of orchard cover crop at time it comes into bloom.

The designer of the San Diego Exposition grounds, John C. Olmstead, has died at his home at Brookline, Massachusetts.

Six bankers of Anaheim and Santa Ana are uniting with farm bureau members in encouraging more pure bred dairy stock.

Dean Thomas F. Hunt of the college of agriculture has been investigating alkali and flood reclamation in several Southern California counties.

Residents of Palo Verde Valley are requesting the state highway commission to hurry up the construction of the road from Mecca to Blythe.

The Merchants and Manufacturers Association of Santa Ana, Orange County, is discussing advisability of community daylight saving plan.

The dairy department of the Orange County farm bureau it is expected will develop into a mutual buying organization for purchase of feeds in large quantities.

The Cypress drainage district in Orange County is now considering proposal to discharge its drainage through canals on the Bixby and Hellman properties.

The Salton Sea shows higher water than any time during the past year, caused by local rains. Several sections which had become dry land are again under water.

The dairy department of the Orange County farm bureau has organized an executive committee composed of M. Babylon, J. T. Raitt, J. J. Kelly, P. H. Kirck and H. L. Wakeham.

At the last monthly meeting of the Claremont-La Verne-San Dimas farm center in Los Angeles County J. P. Englehart of Glendora demonstrated his system of pruning lemon trees.

A mass meeting of the dairymen of Orange County will be held the second week of April at the dairy of J. T. Raitt near Santa Ana. This will be under the auspices of the dairy department of the county farm bureau.

Owensmouth, Los Angeles County, farm bureau center has an "inoculation committee." The bacillus is harmless, however, or rather is beneficial. The inoculation has to do with legumes though the committee reports: "What the soil needs is more humus; the bacteria are already here."

The Coast and General

Some of Arizona's best Pima is bringing a dollar a pound.

Cowlitz County, Oregon, has a cow testing association of 500 cows.

Wenatchee, Washington, has 1,600 cars of apples waiting shipment.

The Willamette Valley potato market is running around $4 for best stock.

The Texas onion growers will be allowed to bring in contract labor from Mexico.

The Yuma County, Arizona, Water Users Association elected A. Y. Greer, president.

The Southwestern Stockmen's Association recently elected S. G. Brite, president.

Recent rains have put the Arizona ranges in good condition and the livestock situation is improving.

Farmers of New York are reported to be lining up to fight the recently enacted state daylight saving law.

Later returns indicate truck crops nearly wiped out along eastern coast of Florida by frost early this month.

Spinach growers of Walla Walla, are shipping some of their stock to canneries at Salt Lake and Denver.

The main canal on the Yuma project recently washed out in the floods, and the ditches were dry for some days.

Texas lettuce growers are seeing the necessity of putting up a better pack in order to compete with California lettuce.

Walla Walla Valley, Washington, has started marketing spinach. $2 per crate was received for the first shipments.

California lemons are not commanding as long prices in New York and other Eastern markets as they did six weeks ago.

Somerton, Arizona, is erecting a $40,000 long staple gin. Large contracts have been made with the Goodyear Company.

Egg producing sections the United States over report great increase in output over 1919. California's district showing greatest increase is that around Petaluma.

The 534 cows in the Stillaquamish, Washington, testing association, which were on test during the month of January, averaged 576 pounds of milk per cow and 27.2 pounds of butterfat per cow. Six cows produced over 60 pounds of butterfat.

According to a recent survey of the dairy situation, it was found there are 23,000,000 cows in the United States, producing 84,611,000,000 pounds of milk per year. Of this amount only 43 per cent is used as whole milk, which is less than a pint per person.

Boys' and girls' club work in Tillamook County, Oregon, even without a regular leader, resulted last year in the production of $1,358 worth of produce at a cost of $570, according to the annual report. Potato clubs produced $230 worth, garden clubs $120, pig clubs $261, and calf clubs $96.

The Klamath County, Oregon, Wool Growers Association has elected the following officers for the ensuing year: E. M. Hammond, president; M. P. Barry, vice-president; J. H. Carnahan, secretary; J. W. Siemens Jr., treasurer; Jerry McCartie, I. C. McCall, Dennis O'Connor, D. B. Murphy and Dan Driscoll, directors.

Bud Selection---Stock Selection---Efficiency

By C. B. Messenger

WAY back in '86 when I landed in California I believed all the real estate agents told me and decided that the only way to ever secure an orange grove was to buy at once before some other imaginary sucker had taken the last desirable piece of such property. The one particular selection that had been made for me had one qualification which finally clinched the deal. This was, "The Navel trees in this orchard were budded from trees only 'one remove' from the original Tibbets tree." This, I was assured, was almost as good as buds from the original two Washington Navel trees. The idea was carried, as the "removes" increased the virtue in the tree decreased.

In proof of this claim that "bud selection" was a good thing one of California's first treatises on "The Orange," written by Wm. A. Spalding and published in '85, was referred to for authority. Mr. Spalding said: "Original Buds—It is advisable then, in budding to a choice variety, to go back to the original stock, if possible; otherwise to get buds only one degree removed from the original, and those grown on non-deteriorating trees. Too much care cannot be exercised if our standards are to be maintained."

In finishing the planting of the unimproved part of this place I visited nurserymen who made claims as to nearest relationship to the original two Navel trees. But in those days, the boom of '86 and '87, when everybody planted everything, nurserymen were charging up to $2.35 for good Washington Navel trees, and certain importers got busy and scores of carloads of Florida trees were imported. Thus was introduced into California a conglomerate mass of varieties and even many trees not worthy of being called varieties, and with it all, purple and some other scales which have caused untold loss and sorrow. Had we stuck to the principles being explained to us in those days and planted in orchards only our own home grown trees, with few removes from the original, California would be infinitely better horticulturally. With this mass of stuff from Florida, however, came one good introduction; that was sour stock. Prior to that the Tahiti seedling was the preferred stock though much of our stuff had been grown on stock secured from culls of California sweet seedlings.

W. T. Kirkman

So in those early days of a third of a century ago, bud selection and stock selection were great factors in our prosperity, and it is very probable that the pioneers of those days were preceded by others, seekers after higher producing and longer lived strains of stock.

But as much reasonableness and common sense as there was in the plans of those days it has taken many years to arrive at practical, everyday application of these principles. The "removes" from the original stock was soon forgotten and nurserymen and growers found easier securing of buds from certain types of thrifty trees, which meant more wood and less fruit. Then came the knowledge that some trees were persistently great producers of large quantities of the finest fruit, while an adjoining tree equally as regularly produced smaller quantities of inferior fruit.

J. H. Reed, who passed only a few days ago at Riverside, was one of the first to make this observation and, following his natural bent, he was continually asking "Why," and believing that an answer could be found he interested others and application was made to the department of agriculture at Washington for an expert to investigate the subject. For, once we were told why, the way was open to stop these non-producing trees from being

J. E. Bergtholdt.

reproduced and to secure a greater percentage of the high quality and quantity producers.

Shamel came, Scott came, and other scientists from Washington, and they found growers, practical men of years of experience, lending fullest cooperation. The story is long and too well known to repeat here.

After spending some years in the work Scott was assigned to other fields, but the good work he did was remembered, and now the state is bringing him back. I say, the state is bringing him back, though less than a score of men are directly responsible for the work which he is to take up. But in the body of men are included the largest and best operators in their line of business in the world. I believe in the years to come they will be classed with others of our pioneers as worthy of places in the state's hall of fame.

The bud selection, the stock and seed selection problems which have been studied all these years will be practically worked out. The slipshod methods of the backyard nurseryman will be eliminated. The workman who studies out the principles and applies them will win the reward which comes from returning great benefit to the state and—we hope—more immediate financial reward.

Speaking on the topic "Standardization of Commercial Nursery Products" Wm. T. Kirkman, Jr., said at the San Jose convention of nurserymen held at San Jose in October, 1917:

Max J. Crow

"It seems to me that a good way to begin a movement of this kind that will eventually command the cooperation of every propagator in the state would be to collectively organize and own a sort of bureau for the careful and diligent study of varieties and distribution of propagation wood.

"This bureau for the betterment of California horticulture would appoint an advisory commission of a few of our members who are best fitted by experience to act as a consultation board, and they employ an active, competent man to personally make a careful study of standard and new varieties and determine from what portion of the state, and from which orchards, and from which individual trees in said orchards, can be procured bud wood of the record breakers of each respective variety being called for by the planters of the state.

"The proposition I want to ask you to think over for later definite action is the standardization of varieties, and by this I mean the selection and improvement of varieties wherever possible, the elimination of inferior strains and the general adoption by the California Nurserymen's Association of well defined varieties."

At the Riverside convention in 1919 the formal resolutions set forth that: "The annual production of economic and ornamental plants in California aggregates about four millions of dollars, and the total investment in land and improvements totals something like ten millions of dollars. Fruit growing and commercial plant growing has reached a higher development and a greater exploitation in this state than in any other American commonwealth, representing an annual turnover of about one hundred and seventy-five millions of dollars, covering a wide diversity of orchard and vineyard products, of plants and flowers, than is enjoyed by scarcely any similar geographical area."

L. B. Scott

This was followed by recommendations as to the federal quarantine and a general discussion of standardization and stock improvement plans. This discussion was continued in the interval between the Riverside convention and the one closed a few weeks ago at Chico. At that convention definite steps were taken, outline of which was given in former Cultivators.

It was realized that the time had come for definite action and a strong working committee was appointed which held several meetings and got definite action looking toward an organization supported by sufficient capital to make investigations and put into actual operation a producing plant where selected seeds, buds and stocks might be produced. This finally resulted last December in the election of a board of directors consisting of Wm. T. Kirkman, Jr., Fresno; J. E. Bergtholdt, Newcastle; H. A. Hyde, Watsonville; J. S. Armstrong, Ontario; J. W. Barnicott, Newcastle; Geo. C. Roeding, Fresno. Wm. T. Kirkman, Jr., was elected president; J. E. Bergtholdt, vice president, and Max J. Crow, secretary and treasurer. Committees were delegated to negotiate for the location and the purchase of a permanent farm headquarters for the association; likewise to engage the services of a manager, superintendent, etc The wisdom of the board of directors was shown in the selection of L. B. Scott as superintendent and manager.

Who is Scott?

Those of us who became acquainted with him when he was connected with the work at Riverside can answer in a word, "A most pleasing and capable gentleman." His photograph appears in the upper right hand corner of Page 471 this issue. In addition, we wrote to Mr. Shamel's office in Riverside regarding Mr. Scott's work, and in the absence of Mr. Shamel, R. E. Caryl writes:

"In reply to your letter of the 28th requesting information regarding Leo B. Scott, you may consider the following as fairly correct as I have known Mr. Scott personally since 1911.

"Graduate of the horticultural department of the Michigan agricultural college in the class of 1911. Immediately after graduation he started work as a scientific assistant in the horticultural and pomological investigations, bureau of plant industry, United States department of agriculture, under the direction of A. D. Shamel in the work of the improvement of citrus fruits through bud selection, which was then being carried on in Riverside and Corona. He was connected with this work until November, 1916, when he left for Washington, D. C., to take charge of the office of tropical and semi-tropical fruit investigations.

"In 1914 he was given the title of Assistant Pomologist and in 1916 the title of Pomologist in the department.

"While engaged in the work of the improvement of citrus fruits in California he attained considerable prominence as a lecturer and speaker on

H. A. Hyde

horticultural subjects at the annual meetings of the State Fruit Growers Conventions and other gatherings of a similar nature.

"He is the co-author with A. D. Shamel and C. S. Pomeroy of the United States department of agriculture Bulletins Nos. 623 and 624 entitled Citrus Fruit Improvement, A Study of Bud Variation in the Washington Navel Orange and the Valencia Orange, respectively; also the as yet unpublished bulletin entitled Citrus Fruit Improvement, A Study of Bud Variation in the Eureka and Lisbon Lemons.

"Mr. Scott is undoubtedly the best man that could be found today, for the new position which he has just accepted, as his long experience, study, and investigations of the behavior of plants in their relation to commercial agriculture and horticulture has peculiarly fitted him for the position of manager of the California Nurserymen's Bud Selection Association where the sole object of the organization is the production of better trees and more productive trees for the benefit of the best horticultural state in the Union."

Mr. Scott has written us: "I expect to leave for California about the first of April to assume my new duties with the California Nurserymen's Bud Selection Association." We believe the effort made by this association is worthy of highest commendation and we are glad to encourage it. It has been made possible by the energy and

J. S. Armstrong

hard work of President Kirkman seconded most ably by the efforts of Vice-President Bergtholdt. Every other member of the board of directors is joining heartily in plans to make the work of the association a success.

RULES FOR MAKING GOOD CONCRETE

Good concrete for posts, blocks, floors and troughs can be made by observing a few simple rules urged by the division of agricultural engineering of the University of Minnesota, as follows:

Use cement that has been kept dry.

Use clean sand and gravel or crushed rock.

Measure the cement, sand and gravel in the proper proportions.

Mix the cement and sand thoroughly, then add the gravel and mix thoroughly.

Place the concrete immediately, and tamp or spade thoroughly.

Protect from freezing for two days or from drying for four days.

It is poor economy to try to save by not using the proper amount of cement in the mixture. The labor, forms, sand and gravel cost as much for a lean, weak mixture, which will not be permanent, as they do for a rich mixture which is suited to the place where it is to be used and which gives at a slight additional cost for cement both permanence and satisfaction.

By a recent ruling of the labor department at Washington arrangements have been made whereby Mexican labor will be admitted into the Southwestern states with the suspension of the literacy test and the per capita tax. This ruling is of the utmost importance to cotton growers and sugar beet growers.

J. W. Barnicut

Copyright 1920, by The Goodyear Tire & Rubber Co.

"I haul on pneumatics and deliver fruit unbruised—direct from tree to town —no reloading from orchard teams. Others here have ruined thousands of dollars' worth of fruit by jolting it on solid truck tires. A truck contractor has used two sets of solid tires since I began hauling on my Goodyear Cord Tires."—F. A. Tufts, Lone Pine Ranch, R. F. D. 31, Loomis, Cal.

IN much the same way as that described above farmers everywhere have demonstrated how thoroughly pneumatic tires equip motor trucks for all farm hauling.

By affording traction, cushioning and quickness that solid tires cannot supply, Goodyear Cord Tires on trucks help users forget crop-moving difficulties hitherto requiring extra labor and expense.

The able Goodyear Cord Tires do away with needless transfers of loads from teams to trucks, protect crops in transit and enable marketing with a promptness that catches prices at their highest.

Their unflinching behavior in grinding toil shows that all the valuable advantages of the pneumatic tire have been made entirely practical for truck duty through the development of Goodyear Cord construction.

This construction furnishes the sinews of a tremendous ruggedness and thus fits the big pneumatics to deliver mileages frequently rivaling those of powerful solid tires.

Farmers' reports, describing in full the effect of pneumatic truck tires in eliminating farm drudgery, assisting general motorization and increasing yearly income, can be obtained by writing to The Goodyear Tire & Rubber Company, at Akron, Ohio.

GOODYEAR

CORD TIRES

Putting Under the Cover Crop

By E. L. Koethen

WE consider the time of putting under the crop a question of paramount importance. So important is it that the practice of growing a crop has often been abandoned because of evil results of allowing it to be delayed too late. In our opinion it should be covered over before it has lost its succulence, for two reasons. First, because it then decays quickly and the fertilizing material stored during the months when the trees were dormant is liberated quickly and is available for use when the trees need it most. Secondly, because if allowed to mature, the woody fiber is developed, which is slow to decay, and the cellulose of the fiber is of such a character that it not only decays slowly itself, but retards nitrification of other nitrogenous materials in the soil, thus locking up the plant food during the fruit setting period.

Another reason for early working is the danger of disturbing the root system of the trees during the most critical period of the growth of citrus trees.

How to Cover

Local conditions must determine the method of covering the crop. Other things being equal, we consider plowing it under best for the reason that then it may be all covered and quickly rotted. Disking will partially cover it and render the soil friable and place it in good tilth. It is a mistaken idea that when the cover crop has been all covered and decayed, it is lost. On the contrary, it is only converted into humus when it has disappeared, and the humus is the ultimate aim in growing it. A lot of dry sticks on the surface of the soil may help to loosen up the soil, but they do not feed the trees. On the other hand the decayed vegetable matter does loosen up and flocculate the soil.

If the soil was plowed in late summer before the cover crop was sowed, it is safer to plow in late winter than it would otherwise be. We consider it already too late to practice deep plowing this season.

The best kind of a plow for this purpose is undoubtedly the disk plow. With it the heaviest kind of a crop can be completely covered, providing the work is undertaken when the moisture conditions are right. Even should it become a little dry before it is finished the disk plow will work when a mouldboard plow is useless. If the latter is used, a rolling coulter is a useful attachment to the plow, as it slices the green vines off ahead of the plow, preventing clogging of the plow. This is especially important with such cover crops as vetch and bur clover.

If disking under is followed, a very satisfactory way is to use the double disk with plenty of power ahead of it. This leaves the ground level and in fine shape.

If rains should cease and the ground get too dry to work before the crop is under, it may be necessary to irrigate before the work can be accomplished. Should it get dry before the material gets a chance to rot, it is necessary to wet up the soil, as it might be a serious blow to the growing trees to allow the loose plowed soil to become dry at this season.

Another matter that should be considered is the army worm. We have seen this pest crawl up the green plants under the drip of the tree onto the limbs and bore holes into a large percentage of oranges. For this reason the entire cover crop should be covered and cleaned up before the first of April, as the main brood of this worm makes its appearance about that time. It is about time for this pest to make its appearance again in its periodic attack on our crops.

In closing, we would say that no matter how large or how small the growth of the cover crop at this period, we would advise getting it under at once. Remember that even a comparatively short growth above ground is augmented in bulk by the growth under ground and thus a larger tonnage is obtained than is realized.

SUPPLEMENTING COVER CROP WITH MANURES

By Fred M. Reed

THE writer has been in the citrus game for about 30 years and has seen the introduction of the cover crop as a factor in fertilization and all the phases of its development. It would seem as if by this time some definite method of cover crop management should have been developed and so well verified by practical experience that one could say with assurance, "This is the way to do it."

Unfortunately, this is not the case. Many successful growers have no use for the cover crop at all, but depend on manure or commercial fertilizers, or both, to make their crops, while other growers who are near failures are very enthusiastic about cover crops and apt to be quite dogmatic as to how and when to put them down. As a matter of fact, after trying all the different ways of getting the cover crop into the soil, and watching the methods of others, we are not able to see that it makes any difference how it is done, if the work is done well.

This district has not made an enviable record in quantity of fruit per tree production, but in the far too few instances where production equals or approaches that of the best citrus districts, it is invariably found that those growers have consistently used liberal amounts of commercial fertilizers and manure, and that they get these results irrespective of whether they work their cover crops in early or late, whether they use a plow or disk to do it with, or whether they have any cover crop at all.

It is no great compliment to the intelligence of the citrus growers that after many years of practical experience and observation no more definite rules of handling the cover crop should have been developed, but there is no use trying to dodge the facts. We do know that while pruning, fumigating and various methods of orchard management are desirable and necessary, the factor that makes the difference between crop and no crop is the liberal and constant use of good fertilizers.

GROWING COTTON

Tne college of agriculture of the University of Arizona has issued Bulletin No. 90, "Growing Cotton in Arizona," by G. E. Thompson and C. J. Wood. It gives general cultural directions which will have much of value for the beginner in cotton growing. From its summary we give:

In growing cotton, good seed is extremely important.

A rich sandy loam soil, well supplied with humus, is ideal.

Early, deep plowing and thorough preparation of the land are necessary.

The seed bed should be wet to a depth of four to five feet.

Plant early, but not until the ground is sufficiently warm to insure good germination and thrifty plants.

The character of the land should govern the rate of thinning.

Cultivation should begin as soon as the plants are through the ground well enough to mark the row.

Proper irrigation is the most important single item in the growing of cotton.

After planting, withhold irrigation as long as possible.

Prevent excessive growth.

The terminal bud should be kept growing slightly in the lead of the flowers on the fruiting branches.

In picking, keep the cotton clean.

Volunteering cotton does not pay.

Report trouble with disease or insect pests to the agricultural experiment station or the state entomologist.

Do not allow the soil to become depleted; practice crop rotation; maintain a balanced agriculture.

Abundant Power
Demands a Tractor Magneto

Abundant power means complete ignition of any grade of fuel securing the full force of the explosion at the instant when the piston is at the top of the power stroke.

The New Hart Parr gets its abundant power for three plows from the intense, hot spark delivered by a K-W Magneto.

This magneto is designed specially for tractor service—to produce a sure spark at low speeds—to stand the severe conditions of farm work—to give reliable service without expert attention.

The longer a firm has built tractors the more certain you are to find them using K-W Magnetos.

When you're looking for power in a tractor see that the magneto bears the K-W trade mark.

REO

Figure This for Yourself

How much more would it have meant to you in the past if you had been able to deliver your crops, your garden truck, your dairy produce or your live stock—hogs, cattle, sheep—to market in time to take advantage of the highest quotations?

Figure back—you'd have been a very rich man by now.

Add to that what you would have realized from a greater acreage seeded each year, and crops harvested in prime condition so as to command the highest prices.

This extra efficiency—this extra profit—is now possible to the Country Business Man.

A Reo "Speed-Wagon"—on pneumatic tires—will enable you to rush your produce to market within a few hours after you have gotten the top quotations—and to deliver the most perishable fruits or live stock in prime condition and with the minimum of depreciation in weight and value.

Free yourself from a non-competitive, small-town market!

The "Speed-Wagon" brings several markets within reach and stimulates competitive bidding.

No matter what your specialty or the nature of your produce, you can have a body that exactly suits your needs, by mounting on the basic body below any of the attachments shown at left. The adaptability of this "Speed-Wagon" is almost limitless.

Two standard types are shown at bottom—the standard basic (express) body and the canopy express—and you can buy from your Reo dealer any or all of the attachments for a few dollars extra—either at time of buying the "Speed-Wagon" or any time thereafter.

Electric starter and lights are standard equipment.

"THE GOLD STANDARD OF VALUES"

A Paying business proposition

The fact that the "Caterpillar" Tractor has stood the test of time—that it is backed by years of manufacturing experience—is, to many purchasers, ample proof of supremacy. And many find its strongest claim to merit in the fact that the "Caterpillar" Tractor was the exclusive choice of France, England and the United States for their heaviest and most severe war work.

There are still others who require more definite, individual proof that the "Caterpillar" Tractor will be a paying business investment for them. The latter class of purchasers find conclusive evidence in the experience of the thousands of successful and satisfied "Caterpillar" Tractor users that makes this tractor their choice, and in the number of "Caterpillar" Tractor owners who, when requiring additional power, purchase more Holt equipment.

This advice is old, but wise to follow—

"Ask the man who owns one."

Recent Fumigation Development

By H. J. Quayle before Citrus Institute at San Bernardino.

WE are now practically at the close of the third season in the use of liquid hydrocyanic acid, and this period of experience has established beyond question the practicability of the use of such material and its adoption as a marked advance in fumigation methods. Some of the difficulties encountered in the first year or two of the use of liquid hydrocyanic acid, or prussic acid, have now been almost entirely overcome. The purity has been standardized, greater recovery has been effected in the liquefaction process, and the handling of the material has been made reasonably safe.

The important development of the year, from the manufacturing standpoint, has been the demonstration that liquid HCN of high purity may be obtained from low grade materials. In fact, one of the plants that has been furnishing the liquefied product during the past season has been using as the raw material, not sodium cyanide at all, but a different compound low in cyanogen content, from which high grade prussic acid is obtained. Whether or not there are advantages in efficiency or economy, more than one source for raw materials is an important addition to the industry.

Some more definite conclusions have been reached during the year in regard to the general use of liquid HCN. While a low grade material is not desirable, it is generally agreed that, from the standpoint of safety, the product may be of too high a purity. Consequently material of 95 or 96 per cent purity has been recommended for the present. On account of its volatility and low boiling point prussic acid of 98 or 99 per cent, or even higher, has proved to be of more or less concern to fumigators in handling. A reduction of two or three per cent in purity will not overcome all possibilities of danger by any means, but a product of 95 or 96 per cent answers the requirements for efficiency, and it is handled with greater ease than a product of extremely high purity. The question of the uniform diffusion of the gas under the tent was a point of some doubt a year or so ago, but with the higher purity of the present output this is no longer considered important. The past season's experience has also borne out the necessity for using an amount of the liquid that would produce about the same amount of gas for a given tree as was formerly generated by the pot or portable generator.

Red Scale Fumigation at Corona

In addition to the more general problems connected with fumigation, the citrus experiment station has been devoting particular attention to fumigation of the red scale at Corona. This problem has been occupying our attention more or less since 1915, but beginning in April, 1919, a systematic study of the situation was undertaken and since that time Hugh Knight, assistant entomologist, has been almost continuously in the field at that place.

For several years past unsatisfactory fumigation results have prevailed with red scale in many of the lemon groves in the vicinity of Corona. Ordinarily the 100 or 110 per cent schedules, in some cases even the 85 per cent schedule, are sufficient for the red scale, but in the Corona district even much higher schedules are not satisfactory. Our own field tests, as well as the commercial work, abundantly bear out the fact that the red scale is actually more resistant there than in some other sections, rather than that poor results may be ascribed to insufficient dosage, poor tents, or lack of attention to the details of the process. In any comparative fumigation tests the work must be done under identical conditions, hence the work must be done at the same time and place and preferably the comparison made under the same tent. We have been able to meet these conditions with red scale. Lemons from two different localities infested with the red scale have been fumigated under the same tent. Such tests have been caried on for five seasons with almost uniform results, which show that the scales from Corona are actually more difficult to kill than the same scales from some other sections.

Having determined the cause of the unsatisfactory results, what is the remedy? Naturally, our first conclusion was to increase the dosage. Where the scales are most likely to survive the fumigation is on large thrifty trees with heavy foliage, the heavy foliage type of Lisbon tree particularly, and in the Corona section there are a lot of thrifty trees including lemons, oranges and grapefruit. We have determined that the more foliage there is under the tent the more gas it requires to effect a killing of the scales. Under a tent with no foliage and under a tent of identical size and shape enclosing an ordinary orange tree the difference in efficiency with the same dosage amounted to 10 per cent in favor of the tent with no tree enclosed. A tree of heavier foliage would result in even greater difference. After a series of experiments in the field, a special schedule was worked out to meet the particular situation, based upon the percentage of kill at different dosages and on different sized trees. This dosage was only slightly increased for the smaller trees but rapidly increased with the size of the tree until, with the largest trees, the dosage amounts to 160 per cent.

While this dosage has given much better results than heretofore, still in some cases too many scales survive the fumigation. We have considered, therefore, other factors which might have a bearing, such as the condition of the scale and the time of year. Our results have shown that there are two stages of the red scale that are most resistant to hydrocyanic acid gas. These are the adult or mature stage, and the second molting period, and of these two stages the insect is more resistant during the period of the second molt.

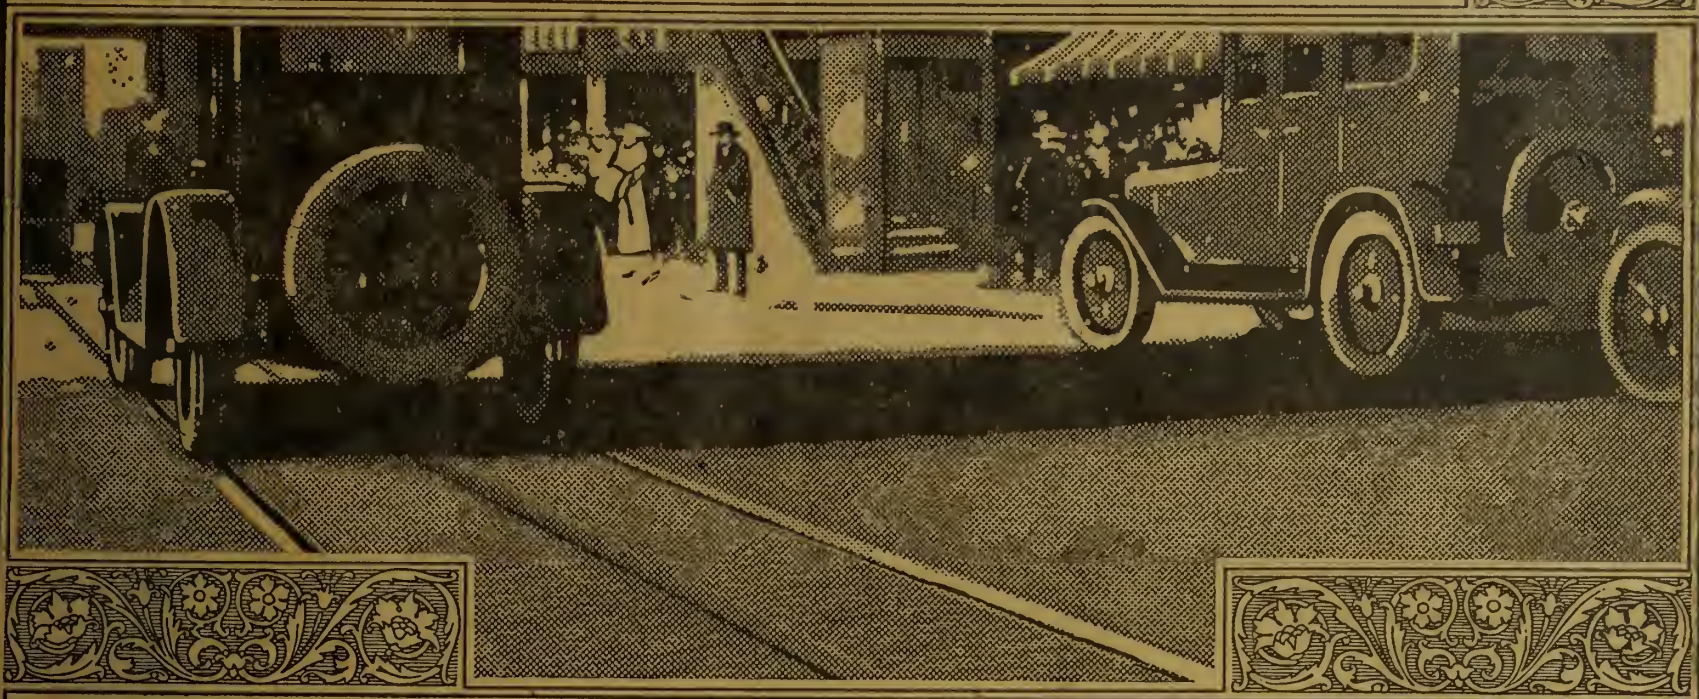
On account of the difference in resistance at different periods in the development of the scale, it would be expected that the best fumigation results would be secured at a season when there are the fewest numbers in these resistant stages, and we have found such to be the case. But, unfortunately, the red scale may be found to a greater or less extent in all stages at practically all seasons. However, the work we did in April and May last year proved to be the most satisfactory of the entire season, even where the maximum dosages were not used. Trees in several different groves that were fumigated at that time are still comparatively clean. Whether we can duplicate these results this year between this date and early in June remains to be determined.

It has already been stated that the red scale is hardest to kill on the thrifty trees, and it is also true that resistance to the gas varies according to the part of the tree on which the scales are situated. It is a well known fact that scales are much more difficult to kill on the fruit than on the leaves or branches; the red scale is also more difficult to kill on sucker growth than on less thrifty growth, on older mature fruit than on young fruit, and apparently more resistant on the leaves than on the twigs. The question of resistance here is evidently related to the food supply.

Lower schedules allow many scales to survive on the leaves and twigs With the schedule of dosage we have adopted at Corona, practically the only scales that survive are on the fruit It is advisable, therefore, to pick the scaly fruit soon after the fumigation The red scale on navel oranges at Corona represents no serious problem, because the fruit is picked within a reasonable time after the fumigation. With lemons, Valencias and grapefruit the scales that survive on the fruit have a chance to increase and spread during the following summer before much of the fruit may be picked.

The request for this discussion has come too soon to give complete report for the year. Further corroboration of winter and early spring fumigation, which has given considerable promise, will not be available until later. Fumigation in the Corona district during the past season has been practically in charge of the citrus experiment station, and we desire to express our appreciation for this cooperation.

Go to a Legitimate Dealer and Get a Legitimate Tire



THIS year the American people will spend more than $900,000,000 for automobile tires.

Tires are one of the largest items in the motorist's budget.

The cost is making even careless buyers think and inquire.

And the more they inquire, the smaller will grow the influence of hearsay and the irresponsible tire dealer.

* * *

We have all met the man who takes his opinions readymade.

He tells everything he knows. He knows more about every car than the man who made it, where to buy the cheapest truck

Every time you drive your car along a track or a rut in a country road you are taking some life out of your tires.

Worn frogs and switches often cause small cuts, which are rapidly enlarged by the action of gravel and moisture. Ruts and track slots pinch the tire, wearing away the tread where their edges strike it.

It is well to avoid such places as much as possible.

—how to get the biggest bargain in tires.

He always arouses a certain amount of wonder in the unknowing. They never think to ask him where he gets his secrets.

* * *

"Somebody says" and "everybody does" are responsible for more wrong impressions about tires than anything else you can think of.

It is on the people who come under the influences of these phrases that the irresponsible dealer thrives.

You generally find him with the name of a standard tire displayed in his windows to give an impression of quality.

But when you get inside the first thing he begins to talk about is price and substitution.

What the thoughtful motorist is looking for today is *better* tires.

He goes to a legitimate dealer and gets a legitimate tire.

The *quality* idea—the idea of a quality tire, of a dealer who believes in quality—is commanding a greater respect from a larger portion of the motoring public all the time.

It is the idea on which the United States Rubber Company was founded—on which it has staked a greater investment than any other rubber organization in the world.

Build a *tire* that will *do more, a better tire than was built before,* and you are sure of a large and loyal following.

We have never been able to build enough U. S. Tires to go around.

Fifty-three Factories The oldest and largest Rubber Organization in the World Two hundred and thirty-five Branches

Daylight Fumigation

Daylight fumigation represents a development in the fumigation process that has been carried farther during the past season than any previous single season, or, in fact, in all previous seasons put together. One fumigation outfit in Orange County started and continued throughout the season by working during the day. In connection with our red scale work at Corona we have been doing daylight fumigation since last September.

We have always assumed that light and temperature were two important factors in connection with fumigation injury, and, so far as the developments have occurred during the season, I think we are justified in still so assuming. But we have ventured out into the daylight much more boldly than heretofore, and we know something more about the results, although I would not presume to claim that much more than a start has been made on the subject.

During the present winter months, December, January and February, daylight fumigation has been carried on in various sections of the citrus belt with satisfactory results. During this season the usual heavy dew at night and the wet cover crop or other growth in the grove, make night fumigation less desirable than day fumigation. The temperature and light conditions and the condition of the tree during this period are not likely to be unfavorable. In such an interior section as Corona daylight fumigation during September, October and a part of November was much more likely to do injury than night fumigation. The dosage could not be reduced to avoid such injury without sacrificing the results on the scales. Valencias are most susceptible (aside from some of the minor varieties, such as St. Michael), Navels less, and lemons the least, susceptible to injury by daylight fumigation. Trees were injured by temperatures of 80 to 85 per cent Fahrenheit in October that were not injured by the same temperature in January. This is probably due to a difference in light intensity or in the condition of the tree. Except in winter a temperature of 65 or 70 degrees is near the maximum for oranges. In January we have fumigated oranges with a heavy schedule at a temperature of 89 degrees without important injury. The season when daylight fumigation can be practiced with safety will be longer, of course, in the cooler sections. Likewise, when high dosage schedules are not necessary there will be a greater margin of safety in daylight work.

Typical daylight fumigation injury is characterized by more or less heavy leaf drop or foliage injury on the south side of the tree. Sometimes the foliage injury is severe without fruit pitting, but daylight fumigation will cause fruit pitting just the same as night work. Some of the older leaves are given a pale white color over a portion of their surface, which is also a manifestation of the effects of light and gas injury. The stomata of older citrus foliage is said not to undergo any movement as a result of light and darkness, but there appears to be some penetration of the gas through the cuticle. In the younger foliage gas penetrates more easily through the thinner cuticle and probably also more readily through the stomata.

From our work thus far it appears that somewhat better results can be secured in day than in night fumigation with the same dosage, or, in other words, the dosage may be reduced slightly in daylight with the same effect on the scales.

Daylight fumigation is not likely to supersede night fumigation, but at the time of the year, or the locality, where the conditions are favorable, daylight fumigation will probably be more widely practiced than at present. Because daylight work has been satisfactory during the latter part of the present season, this should not be a criterion for beginning work on the same basis during the higher temperatures of the coming season.

Light, temperature, season, condition of the tree, variety of the tree, and amount of dosage, are the main factors influencing injury, and where these factors are favorable, as I have attempted to point out, daylight fumigation can be practiced with a fair degree of safety and with satisfactory results on the scales.

MORE COOPERATION

The organization of the Stanislaus Growers Association was completed at an enthusiastic meeting held at Modesto on Thursday, March 4, attended by a large number of leading fruit growers of Stanislaus County.

This meeting brought to a close probably the shortest and most successful campaign in the history of the cooperative movement in the state. Thirty days ago the project of the cooperative canneries had not been taken up, but at the solicitation of a few prominent growers two representatives of the California Cooperative Canneries, Dallas H. Gray of Armona, a leading raisin grower and one of the organizers of the Associated Raisin Company, and Harold T. Johnson of Santa Clara, a member of the Cooperative Canneries at San Pose, presented the project. At the meeting this past week subscriptions to the new cannery fund were turned in to the extent of $117,000, with assurance of upwards of 2,000 tons of fruit. It is expected that the funds for the cannery will be increased rapidly and reach within a short time the figure of $175,000.

The local association was formally organized and directors for the first year elected as follows: T. K. Beard, E. A. Jones, R. Farr and H. G. Pierce of Modesto; M. S. Amerine and L. E. Pitts, representing the McHenry district; H. G. Huls of Salida; J. W. Hackett of Ceres; Geo. N. Pfarr of Empire; M. L. Harmon of Denair and P. A. Hunt of Oakdale. The board of directors completed their organization by electing H. S. Amerine, president; H. G. Pierce, vice-president, and Geo N. Pfarr, secretary-treasurer, and the executive committee consisting of the president, secretary and T. K. Beard.

A site for the new cannery will be selected at once and construction work started, which will insure the completion of the cannery to handle peaches during the coming season.—R. G. S.

BULK THE GRAIN

Labor costs money. Cut it out when possible—not lazily but energetically Bulk handling of grain is one way.

When the grain is spouted directly from the bulk attachment on the harvester to the grain tight wagons (which are drawn with the machine or brought up by teams as needed) there is no occasion for the services of the jiggers and sewers on the harvester. The crop is then handled by a small elevator into the storage bins and later, when market and hauling conditions are satisfactory, trucked to the railroad siding and placed in the loading station or in the cars, without at any time having been shoveled or lifted by hand.

This change makes it possible to harvest and market the crop with from one to three less laborers than are necessary under the sacking system. And, naturally enough, the others are better satisfied with jobs which consist in driving or attending to machinery than with those involving sack juggling for weeks at a time.

The bulk system is certainly in line with twentieth century ideas, for it substitutes cheaply driven and tireless machinery for human backs and arms. In these days, gasoline engines are certainly preferable to the exercise of "main strength and awkwardness."

COPRA CRUSHING INDUSTRY

Crushing copra, dried kernels of coconuts, became an American industry in war time when European countries were unable to get the raw material. Now an important agricultural problem is the maintenance of the industry in this country, because it has added valuable growth producing substances to American stock feeds. Investigations have shown that a little of the press cake added to stock feed greatly increases its feeding value. The copra press cake is especially valuable as an addition to dairy feed and its worth in that regard has long been recognized in Europe.

Help Mother Nature

NATURE does her share in seed bed building by providing fertile soil, moisture, and healthy seed. There Nature's obligation ends. The rest is up to you.

And the preparation of a mellow, thoroughly pulverized seed bed is almost as important as fertile soil and moisture. Upon it depends the healthy germination of the seed and a sturdy growth of the plant.

A seed bed prepared with **International Tillage Tools — disk harrows, spring and peg-tooth harrows, combination harrows and culti-packers** — will form a solid foundation for a bumper crop because these implements are thorough in their work. And they are not only efficient but also very durable, being made of high-grade material throughout. The name "International" is a guarantee of unquestioned worth.

Let us mail you descriptive folders of these tillage implements so that you will know just a bit more about the preparing of Spring seed beds. With every implement goes an alert, responsive and intelligent service. The International dealer will serve you direct.

PAIGE

The Most Beautiful Car in America

It is no exaggeration to say that our new "Glenbrook" model has been a sensational feature of both the national and local automobile shows. Its fame has traveled from state to state, city to city, and it now occupies an unchallenged position of leadership in the field of five passenger cars.

In our long experience as manufacturers, we have never produced a model that has so quickly won its way to public favor. Everyone, apparently, recognizes in the "Glenbrook" an engineering and designing achievement of the utmost importance.

The "Glenbrook" is now one of the fastest selling cars on the American market and the demand is increasing with each succeeding day. Already our production schedule has been sorely taxed and orders for spring delivery will undoubtedly result in an oversold condition.

Accept our advice, therefore, and inspect this model at your earliest opportunity. Compare it with any five passenger car that the market affords and determine whether it is not, indeed, the greatest dollar-for-dollar value in the light six field.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

ANOTHER FINE ONE

Another glorious rain, with greatest precipitation in the North at Eureka in Humboldt County of 1.38 and greatest precipitation in Southern California at Pomona of 1.05, tapering down to as low as a quarter of an inch in some sections, has been sufficient to drive away the gloom. We repeat, it is going to be a fine year.

AND MILK DID IT

An exchange gives the following news item:

"After drinking three quarts of bay rum, a bottle of milk and a dish of dill pickles, a Delaware man is dead. The doctor says he thinks the milk is what did it."

Naturally, it was the milk. There have also been cases of sophisticated olives and canned fruits, and even a raisin has contaminated a gallon of water. Whatever happens, the farmer gets the blame.

DREHER PRESIDENT

A "charter member" and one working hardest for organization of a cooperative marketing association, which would handle citrus fruits, in '92, '93 and '94 was P. J. Dreher. He has consistently stayed by cooperative marketing since. Most of that time he was manager of the San Antonio Fruit Exchange at Pomona and all that time he has been a representative in the counsels of the central exchange in Los Angeles. He has now been made president to fill the vacancy made by the resignation of F. Q. Story.

SHOP EARLY

Well, we had a real time of it in closing up our income tax reports, and a lot of us are still wondering how soon we will be called in to correct some of the errors and even dreaming of being fined or sent to jail for some lapse or "misstatement."

It's a wonderful document to fill out, not for the professional bookkeeper, but for the most of us. Hence, the best method of handling the income tax for 1920 is to begin work on it during 1920. We imagine some of our subscribers are doing just this thing, for the offer which we made of sending the Farmers Income Tax Primer is still being availed of after the fatal 15th of March, which was the last day for making the report. These subscribers are eminently wise in getting a good start. Shop early.

FRENCH ECONOMY

A returned service man who came back with a French bride preferred charges, or, at least, raised the question of her sanity because her nervous system was so wrought upon by the American H. C. L. She complained that the money went out as fast as it came in. The board of examiners before whom she was tried found her entirely sane. A part of her evidence was: "I can't afford to have my meat delivered in an automobile and I won't." Possibly some of these French brides will be the means of our using a bit less of gas for free deliveries.

It wouldn't hurt Americans to go back to the good old days of putting down a barrel of pork, smoking a few sides of bacon and filling the cellar with a few bushels of potatoes and apples.

COFFEE"

The department of agriculture is issuing a very sage warning on permitting ourselves to be taken in by the "South American coffee bean," "new coffee bean," "coffee berry," "new coffee plant," "domestic coffee berry," and numberless other fancifully named substitutes for the real thing. As a matter of fact, these "coffee" beans are very common, everyday beans, either the soya or Jack variety. Beans have long been used as substitutes for coffee, as have the grains of rye and even barley. Some like them; more of us don't. But they are good substitutes, far better and cheaper than some which are widely advertised, and, like margarine, should be sold or used as substitutes only and not as imitations.

If you want to grow coffee, grow coffee where coffee is grown.

In California grow beans, but don't let the faker camouflage beans for coffee.

NEMATODES-EELWORMS

A subscriber writes: "See nothing in your paper regarding eelworms, which are a serious pest in our section. Tell us how to get rid of them."

The question is a long one, but first we would call attention of our subscribers to some of the things we have been saying about nematodes, especially what we have said regarding the seriousness of the nematode situation in California. There are various nematodes and various eelworms, but as a rule the terms are interchangeable, especially as to infestation of potatoes. This matter of eelworms in potatoes will become even more serious than it is today, that is, it will because the California horticultural commissioners, acting as state quarantine guardians, will be compelled hereafter to draw hard and fast lines over which eelworm infested potatoes may not pass. There are tens of thousands of acres already infested. The spread must be stopped if the state is to continue in the potato business. So far as known there is no eradication within economic bounds, therefore prevention is our only hope. Quarantine officials can hardly make their campaign too strenuous for the state's welfare.

ARMY AND NAVY STORES

The awful lot of junk that is being sold through the agency of certain "army and navy" stores has impelled The Associated Advertising Clubs of the World to appoint a vigilance committee, and the vigilance committee seems to be manifesting considerable pep. In the effort to control the H. C. of L. both army and navy have united and have established stations for the distribution of unused war supplies. Some of these, like wool blankets, are renovated or renewed, but always offered on the market at prices which give full value to the purchaser. But for many years there have been so-called army and navy stores which have perhaps carried some supplies which were formerly secured through the army or navy. But these have simply been the carrier for a vast quantity of stuff which is often practically worthless.

The government is now checking up on some of these distributors as well as some others which, for instance, like U. S. Audit Bureau, Washington, D. C., are using names which convey a false impression as to their connection with the federal government. The advertising clubs' vigilance committee is now asking cooperation of the people in locating any organization which is sailing under false colors.

PUT IT ON THE FARM

"The savings of a lifetime on the farm should not be expended upon building city homes instead of building country homes and as soon as people have secured a competence and are in position to have the leisure which would enable them to take an active part in developing an adequate country life they should not abandon the country and go to the city, thus impoverishing country life."

This is a quotation from an address made at Farmers Week at Columbus, Ohio, recently, and as it expresses a truth in California as well as in Ohio, let us think about it a bit.

The pioneer and his wife start life in a new country when comforts, in fact everything except merest necessities, are impossible. The habit of enduring and denying is formed, and when independence comes there is still endurance with the same old inconveniences and crude makeshifts. The independence secured is sufficient to justify the town house which from the necessities of the case carries all kinds of comforts and conveniences which were denied on the farm. Then the comparison is made between farm life, and the housewife is very likely to say, "Never again for the farm!". A little more consideration of the family's comfort will mean much in popularizing farming with our sons and daughters.

BY-PRODUCTS

The possibilities in by-products were shown most graphically in the recent National Orange Show. One corner, almost two entire sides, of the large tent was given to display of by-products of the orange, pomelo, lemon and lime. There were marmalades of all shades of sweetness and bitter-sweetness and put up in most attractive glasses and less attractive tins. There were cakes of orange, lemon and pomelo flavors. There were pies even more diverse. There were stick candies, creams and orange chocolates. There were jellies of all shades and consistencies. There were lemon and orange syrups and vinegar. There were both orange and lemon sweet pickles. There were lemon relishes and cordials of all kinds, nectars almost as diverse, orange filled wafers, orange puddings, even orange and lemon sandwiches, lemon mincemeat and, still more far-fetched, orange sugar. This latter, however, consisted only of ordinary white sugar tinted and flavored to add to teas or other drinks. Some of these products were not intended as an exhibit of practical, large commercial possibilities, but many of them were, and the exhibit was truly educational in that it did offer many suggestions which may lead to the establishment of other factories as large and handling as great quantities as do the marmalade factories at San Dimas, Anaheim and elsewhere.

CAN'T WORK WITHOUT CAPITAL

The American Legion, or at least some of its members, have suggested certain changes in the California land settlement act, which we believe it would be very unwise to grant. One of the features of the act is the provision that every one availing himself of those lands must have a capital of at least $1,500 and in addition some experience in farming. The Legion's suggestion that for ex-service men the capital requirement be entirely set aside would open the way for certain failure of the movement. Not that everyone who has not secured capital would be a failure at farming, but simply that lack of capital in any business, no matter how great the credit, is a most serious handicap, and the young man who endeavors to set himself up in the business of farming with simply his two hands, backed by the credit of the state of California, shows lack of realization of the situation which will confront him. Regarding this question, Dr. Elwood Mead has said:

"The board feels that to accept a settler with less than $1,500 would be contrary to its own judgment. On the large farms like those of 56 and 70 acres, the settler ought to have more capital and the applicants with more capital will be the ones that will be accepted.

"The man without capital is not excluded. The farm laborer can get a two acre block by paying five per cent of its cost. No question is asked about his capital. Payments can be saved out of wages. The farm laborer's allotment is the stepping stone to the farm. The children of the farm laborers at Durham and Delhi will be farm owners in the next 20 years."

The land settlement proposition is a movement by the state to settle unused, or, more correctly, not fully used, lands and to give opportunity for more American homes. It is not in any sense a reward for service plan.

Standards for Certified Seed Potatoes

IT IS understood that potatoes for seed certification should first conform to the general standards governing "U. S. No. 1 market stock." This is interpreted as being practically free from dirt or other foreign matter, frost injury, second growth, growth cracks, cuts, bruises, or other damages caused by diseases, insects or mechanical means, with no more than a three per cent variation by weight from any of the above details. It is also recommended that certified seed be marketed in new sacks or containers.

Size

Inasmuch as oversized tubers are wasteful and less desirable than properly grown, uniform, seed-size potatoes, the seed-size standard shall be from two to 12 ounces for long varieties and two to ten ounces for round varieties, with a variation tolerance of five per cent by weight.

Varietal Purity

Since mixed varieties of seed potatoes are a potent cause of economic loss in potato production and marketing, a rigid adherence to trueness to name is required. Furthermore, since the practice of renaming old varieties or changing the names of named varieties through ignorance, or with malicious intention to defraud, is detrimental to the potato industry, a standard on nomenclature and use of the "Group Classification and Varietal Description of Some American Potatoes," by Prof. William Stuart of the United States department of agriculture, is adopted.

Since offtype or runout strains of any given variety are essentially as detrimental to successful potato production as mixtures of varieties, no stock shall be certified or planted with the expectation of producing potatoes for certification that are not uniformly typical in all characteristics for that particular variety in the district where it is grown.

Pests and Diseases That Disqualify

No potatoes shall be certified that show by inspection on vine or tuber the presence of the diseases known as black wart, powdery scab and violet rhizoctonia, and the pests eelworm and potato tuber moth.

Limitations of Other Infections

Scab. No potatoes shall be certified which show upon the tuber at final inspection more than five per cent scab, with no deep scab pustules permissible.

Rhizoctonia (black scurf). More than 12 per cent shall disqualify and no scurf spot larger than one-eighth inch in diameter shall be permitted.

Vascular infection. Not to exceed five per cent of the tubers, as determined by transverse sections of stem end of tuber in the final tuber inspection, shall be permitted. Vascular infection shall be interpreted as meaning wilt diseases.

Late blight. Not to exceed two per cent of the tubers infected with late blight rot spots, and no spot to exceed one-half of an inch.

Vine Inspections

Inspection of potatoes is not only necessary after the crop is harvested but also during the growing season to determine trueness to type and variety and freedom from disease. This shall be accomplished by an inspection of the potato plants in the field at blooming time and again just prior to maturity of the plant.

Bloom Time Inspection

Variety. More than five per cent varietal mixture at this inspection shall disqualify for certification. Furthermore, a variation in type of plants in excess of ten per cent, indicating degenerate or inferior strains of a variety shall disqualify for certification.

Diseases. More than ten per cent of the plants at this inspection affected by the following diseases, or more than five per cent affected by any one of the following groups of diseases shall disqualify the field for certification:

1. Well-defined "curly dwarf," "leaf-roll," "mosaic," or other inherited weaknesses, combined.
2. "Wilt" diseases and "blackleg" combined.
3. Rhizoctonia (black scurf).

Immediately following the bloom time inspection all diseases or objectionable plants must be rogued under the supervision of the inspector.

Second Plant Inspection

At this inspection the tolerances governing certification shall be: Not to exceed five per cent of mosaic, curly dwarf, leaf-roll and other inherited weaknesses; not to exceed two per cent of diseased plants from any one of the following diseases: wilt, blackleg and rhizoctonia, nor a total of four per cent of diseased plants from these three causes. Roguing of the field must again follow the second plant inspection. If ten per cent or more of the vines show serious infection of late blight, the field shall be disqualified for certification. The uniformity and quality of the product as seed shall be determined at the second inspection, at which time not to exceed five per cent of the hills shall each weigh less than 30 per cent of the average 100 consecutive hills.

Final Tuber Inspection

This inspection shall be after harvest and after final grading for the seed market and shall conform to the conditions as hereinbefore specified.

Certification Tag

There shall be attached to each bag or container of certified seed a certification tag, stating thereon that the package contains certified seed potatoes, also giving name and address of the grower, the variety of the potatoes and the year grown; however, if the seed potatoes are grown under contract and to be sold by a party other than the grower they shall meet the requirements as set forth herein and the certification tag shall be marked either with a lot number or the grower's name and the name of the party for whom the potatoes are grown.

On the reverse side of the certification tag the following "Standards for Eligibility to Certification" shall be shown:

"Freedom from varietal mixtures, and conformity to the correct vine and tuber characteristics of the variety.

"Weight of seed tubers from two to 12 ounces for long varieties and two to ten ounces for round varieties, with five per cent variation tolerance.

"Freedom from wart, powdery scab, eelworm and larvae of tuber moth.

"Freedom from serious infection of common scab, rhizoctonia, wilt and other important tuber borne diseases.

"The holder of a certificate is responsible for all undesirable conditions which may develop after the date of the final tuber inspection.

"A certificate of seed potato inspection in conformity with the above standards has been issued by..... to the person whose name appears on the reverse side of this tag."

HOLD THE FLOODS IN THE MOUNTAINS

(Continued from Cover Page.)

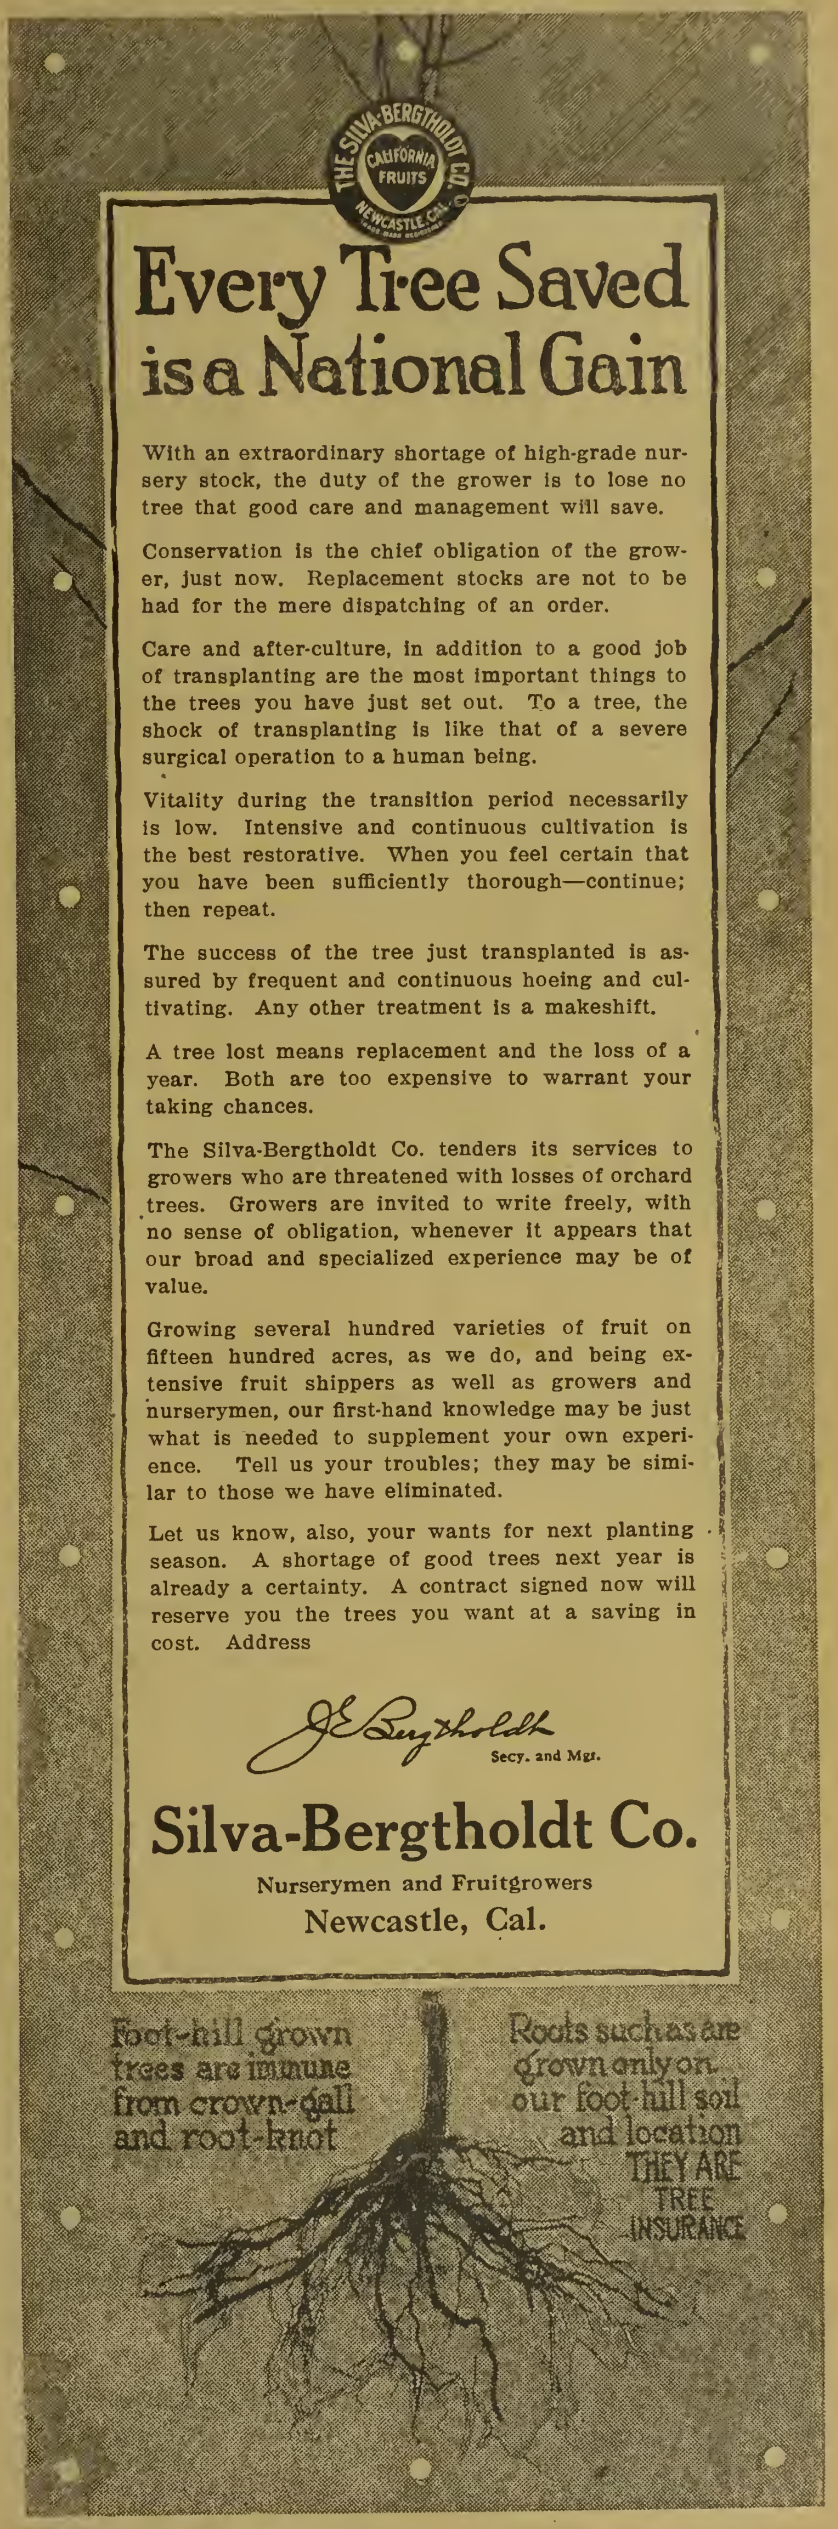
for more definite action in later years. Stream measurement, or figures as to the run-off of various watersheds, is the necessary foundation for definite action in impounding. As Mr. Johnstone suggested, this information is being gathered by expert engineers under the direction of county, state and federal officials. This work will continue, but producers generally must appreciate more fully the needs of the country in this particular.

Don't wear an orange tie to a St. Patrick's Day celebration. Likewise remember that tact is the first requisite of a lasting friendship.—Ex.

Many a man who imagines he could conquer the world and all the folks in it, can't even manage the pests in the garden.

The home garden should be near the house, but not too near the hen house.

Seeds, like mankind, are able to sleep well and get up early if they have a good bed.



THE SILVA-BERGTHOLDT CO.
CALIFORNIA FRUITS
NEWCASTLE, CAL.
Every Tree Saved is a National Gain
With an extraordinary shortage of high-grade nursery stock, the duty of the grower is to lose no tree that good care and management will save.
Conservation is the chief obligation of the grower, just now. Replacement stocks are not to be had for the mere dispatching of an order.
Care and after-culture, in addition to a good job of transplanting are the most important things to the trees you have just set out. To a tree, the shock of transplanting is like that of a severe surgical operation to a human being.
Vitality during the transition period necessarily is low. Intensive and continuous cultivation is the best restorative. When you feel certain that you have been sufficiently thorough—continue; then repeat.
The success of the tree just transplanted is assured by frequent and continuous hoeing and cultivating. Any other treatment is a makeshift.
A tree lost means replacement and the loss of a year. Both are too expensive to warrant your taking chances.
The Silva-Bergtholdt Co. tenders its services to growers who are threatened with losses of orchard trees. Growers are invited to write freely, with no sense of obligation, whenever it appears that our broad and specialized experience may be of value.
Growing several hundred varieties of fruit on fifteen hundred acres, as we do, and being extensive fruit shippers as well as growers and nurserymen, our first-hand knowledge may be just what is needed to supplement your own experience. Tell us your troubles; they may be similar to those we have eliminated.
Let us know, also, your wants for next planting season. A shortage of good trees next year is already a certainty. A contract signed now will reserve you the trees you want at a saving in cost. Address

It Makes Them Grow

You can cultivate your bearing orchards by blasting between the rows with Hercules Dynamite. The shock of the explosion breaks the hard subsoil beneath them. You'll be surprised at the way your trees will grow and bear after you've used a little

HERCULES DYNAMITE

"I couldn't get along without Hercules Dynamite. It does three men's work on my place. And its *easy* to learn how to use it. Send to the Hercules Powder Co. for a copy of their 68 page illustrated book, 'Progressive Cultivation'. They'll send it to you for the asking. This book tells you how to plant trees, dig ditches, cultivate your bearing orchards, clear your land, and do many other things with the help of explosives."

"Better send for that book today—you *need* it."

Hercules Dynamite is for sale at leading dealers.

HERCULES POWDER CO. 1033 Chronicle Building, San Francisco, Cal.

Gentlemen: Please send me a copy of "Progressive Cultivation."

Wonderful New Hay Crop
SUDAN GRASS

First Introduced into the U. S. in 1909 from the Sudan in Africa. Tests by the department of agriculture have proved it to be of the greatest value in the Southern and Western states, where rainfall is deficient.

Culture—Sudan Grass is strictly an annual. It may be drilled or broadcasted. If drilled 8 to 12 lbs. per acre is ample; for broadcasting 15 to 25 lbs. should be used. It grows 8 to 10 feet high and yields from 3 to 8 tons per acre. You are sure of two cuttings, and if irrigated three or four cuttings.

Sudan Grass for Pasture—During the months of August, September and October all other grasses are dry, then is the time Sudan is most valuable for fall pasture, and by having it fenced in small fields it will yield food for six times as much stock as any other forage will without irrigation. For milk cows and hogs, there is no better and more abundant pasture than Sudan Grass. It will solve the hay proposition as nothing else can or will do in this climate. A good silage and balanced ration. This seed was grown on our own farm, and is free from Johnson Grass.

Price Per Pound:

10 lb. lots, 25c — 100 lb. lots, 20c
250 lb. lots, 19c — 500 lb. lots, 18c
1000 lb. lots, 17c

Growing Roselle

By Robert W. Hodgson

FRUITS and nuts indigenous to the tropics and to foreign countries are now, as never before, attracting the attention of the people of the United States, as witness the intense interest now being exhibited in the avocado and the number of such fruits reaching economic importance within the last two decades, among them the avocado, Japanese persimmon, pomegranate, loquat, feijoa, guava, and roselle. The roselle is, however, hardly as well known as most of the fruits mentioned, although it is by no means less deserving of attention.

While many of the more recently introduced fruits are of American origin, the roselle is native to the Old World, where it has been grown and appreciated for many years. A strictly tropical plant, it is very sensitive to frosts and therefore its culture is at present limited in the United States to Florida and California. Since its merits have been realized by the English speaking peoples, it has enjoyed its greatest extension in Australia, in parts of which it is now grown to a considerable degree, being used largely for the manufacture of jams and jellies for export. The roselle is particularly well adapted to the home garden as its culture is so simple and its requirements so few.

Its habit of growth is much like that of the cotton plant, the stems, however, being reddish and branching much more profusely. The plant reaches a height of six to eight feet and bears beautiful large yellow flowers, each with a dark red eye. The plant itself is quite ornamental, and aside from its useful qualities constitutes a valuable addition to our list of ornamental plants. The flowers open during the night and close during the forenoon, so that much of the beauty of the plant is not evident after ten in the morning. The roselle constitutes one of the few cultivated plants in which the part used for food represents a portion of the flower, which is in this case the calyx. The development of the calyx is very rapid, within three weeks after the opening of the flower attaining its maximum size, at which time it should be picked. If left to mature the "fruit," if we may so call it, loses much of its valuable properties. In addition, if allowed to mature the yield of the plant is materially reduced, since in the axil of each leaf there are several latent flower buds which develop only if the first crop is removed. By picking the calyces from the plant as fast as they reach the proper stage, the yield of the plant is greatly increased.

Roselle

Plant marked for seed selection. By proper seed selection it will be possible to double the present yield.

Culture

The plant is an annual and must be planted each year. Since it is very susceptible to frost it should not be planted until all danger from frost is past, which usually means about the first of April in Southern California. Here best results seem to be obtained by planting directly in the field, some five or six seeds being placed to a hill and later thinned out to one plant.

The plants are usually spaced from six to ten feet apart each way, depending upon the character and fertility of the soil. The roselle demands no special type of soil, but will thrive on any soil that is moderately well supplied with plant food. It apparently does best, however, on a rich sandy loam. The use of large amounts of barnyard manure is not to be advised, since in some cases it apparently stimulates the plant to vegetative growth at the expense of fruiting.

For best results the plants require sunshine on all sides, which makes planting in crowded rows unsatisfactory. The aim should be to have the plants spaced so that when full sized there is still a slight distance between them.

Planted early in April if weather conditions are normal, one may expect to begin harvesting the calyces in late August, and the season is in full swing during September and October, the plants continuing to bear until killed by frost. This is in marked contrast with Florida conditions, where the plant is reported as never bearing earlier than October, although it there continues bearing on through the winter months.

Yields and Returns

There is considerable variation in the seasonal yield per plant, some running as low as two pounds while others will produce 12 or 15 pounds of the calyces during a season. However, an average yield of five or six pounds may be counted upon under ordinary conditions. Planted eight feet on the square, there are 680 plants to the acre, which, averaging five pounds to the plant, would give a total yield of 3,400 pounds. At five cents a pound, and during recent years prices have averaged much higher than this, the gross return would be $170 per acre. The labor cost of harvesting is high, running several cents a pound, but from the figures given it is easy to see that while the net returns are not high, there is still good money to be made in growing it. Of course, at the present time the market demand is not large and the business might easily be overdone. Nevertheless, as the product becomes better known and the market demand greater, it is the writer's belief that the commercial culture of the roselle as a jelly and jam fruit is bound to increase and remain

on a sound economic basis.

Seed Selection

The great variation in size of the calyces and in yield of individual plants furnishes favorable oportunity for increasing both these qualities by the proper selection of seed. If the average yield could be doubled, which seems possible, much greater profits could be made. Individual plants which produce large numbers of well formed calyces should be marked for seed selection. The pods for such purposes are left on the plants until the seed pods turn yellow and show signs of splitting at the apical end. They are then picked and dried in the sun and the seed threshed out and stored in a dry place.

In composition the roselle is almost identical with the cranberry. Indeed, it furnishes a most excellent substitute for the cranberry and this quality alone should make it popular with the American people. It may be used in the making of pickles, sauces, jams, jellies, and in many other ways which will occur to the housewife.

In preparing for cooking, the stem and basal end of the pod are cut off at the point of junction of the calyx and seed pod. A slight pressure forces the seed pod out of the apical end of the calyx. The calyx alone is ordinarily used, since it contains the color, but the seed pod also contains large amounts of pectin and may be included for jelly making.

There are very few pests attacking the roselle, about the only one of importance being the ordinary garden nematode which attacks the roots. No satisfactory remedy for this pest on any crop has been found and infested land should not be planted to the roselle.

THE GRASSHOPPER OUTLOOK

Director Hecke writes: Among the many problems involved in the activities of spring which the farmer must solve is the one of fighting grasshoppers in his fields and orchard.

The unusually large numbers of adult grasshoppers depositing eggs in many localities in the late summer months of 1919, the mild winter weather, and the lack of winter rains are strong indications of one of the most severe grasshopper seasons that California has seen in recent years.

With a shortage of spring rains we may expect grasses on waste areas and range lands to dry very rapidly, forcing this pest to migrate in search of food to the green fields and orchards of irrigated districts.

A shortage of rainfall and irrigation water will render orchard trees, vines and field crops less able to withstand severe grasshopper injury.

The high cost of labor and the high prices of farm products are such that the fruit growers and farmers cannot afford to have their trees and vines destroyed and alfalfa fields devastated.

But we have much to be thankful for in that this pest can be controlled where communities become properly organized and diligently practice the most modern methods of fighting grasshopper outbreaks.

The office of pest control is at the present time making all plans for a state wide grasshopper campaign in an effort to offer the most practical service to every individual and every community desiring assistance in the control of this pest. For this purpose we have been fortunate in securing the services of T. D. Urbahns, formerly grasshopper expert for the United States department of agriculture, whose work was a signal success against this pest last year in California.

The University of California and bureau of entomology, United States department of agriculture, will be asked to cooperate in this campaign.

Farmers can assist greatly by keeping close watch of the development of the pest and giving timely warning to State Department of Agriculture, Sacramento, the county horticultural commissioner, or the farm adviser of this county.

NOT EXACTLY

"Marriage is a lottery."

"Not exactly," commented Miss Cayenne. "When you lose in a lottery it's an easy matter to tear up the ticket and forget it."—Washington Star.

VARIATION IN PRECIPITATION

By Charles Kirby Fox

Probably the greatest single factor in determining the character of people who permanently inhabit any section of the globe, their character and products, is climate. The principal factors in making a satisfactory climate are rainfall, temperature, sunshine, humidity and wind velocities. Rainfall is probably the most important of these. If the rainfall is excessive, as in some tropical countries, it is practically impossible for a complete civilization to be maintained, whereas if a great shortage exists either in the annual or seasonal distribution, as on some of the deserts, it renders it impossible for any great development without engineering construction, as is exemplified by the great irrigation works in the Western states. There is one great advantage, however, in connection with irrigation agriculture in many parts of the great Southwest, the growing season is long, while bright sunshine is a very material factor in plant growth.

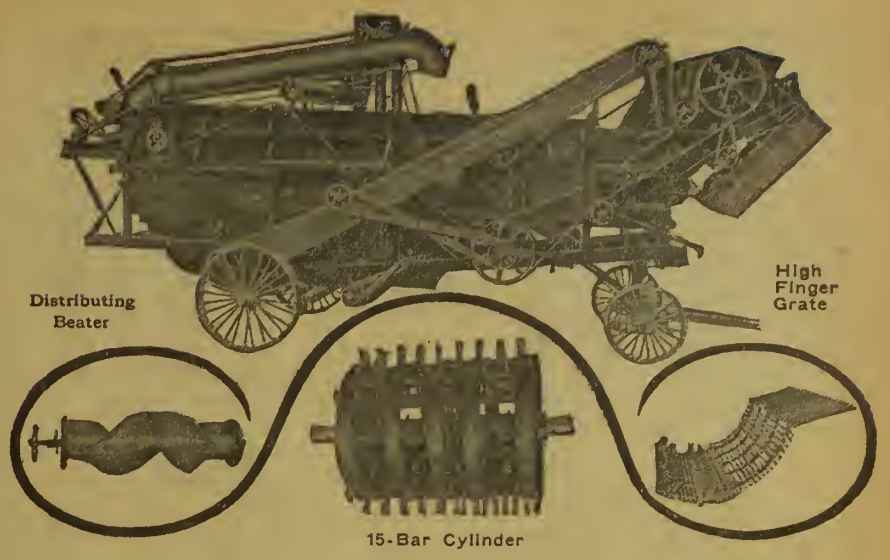
Rainfall in a given locality is subject to a wide variation; seemingly by some cycle of years. Floods usually caused by a heavy rainfall on saturated ground or excessive melting of snow, sometimes cause great damage and usually require extensive protection works, and on the other hand, unprovided for drouths cause great losses also.

Rainfall also varies even within short distances, usually increasing with altitude, but the direction from which the storm comes and the location and elevation of the mountains have a material influence on the rate of increase. During the last few years the local association of members of the American Society of Civil Engineers succeeded in prevailing upon the local weather bureau, then under Dr. Ford C. Carpenter, to make an extensive study of the rainfall in the local mountains.

Rainfall and temperature stations are maintained in several thousand places in the United States. They are usually attended by unpaid local cooperative observers who deserve the commendation of their fellow citizens for their work.

The records I have found to be very reliable, although sometimes the rain gauges are too close to high objects to give best results, and sometimes, unintentionally, I believe, some have placed their thermometers too close to the south side of a large house to obtain the coldest records in the vicinity.

The annual convention of the New Mexico wool growers, recently held at Roswell, gave much time and thought to discussion of disease conditions and rodent control.



Russell—The World's Best Thresher

It is the thresher pedigreed by 79 years of successful manufacture and improvement; and is built *up to* old reliable Russell standards—not *down to* a price.

It has more proven good points and exclusive features than *any other thresher* made, including the famous Big Easy-Running 15-Bar Cylinder, the patented High-Finger Grate, and the patented Distributing Beater that spreads the straw evenly full width across beginning of separating table.

Made in six sizes from 20x34 for individual farm use to the big 36x60—all alike in design and features; the smaller sizes just as strong in proportion to their capacity as the larger sizes.

Send for the new Russell Catalog fully describing our Threshers for grains, seeds and beans; also complete line of Tractors, and Traction Engines—it's free.

Bleaching Walnuts

Please tell me how chloride of lime is used to bleach walnuts.—Subscriber, Stockton.

The following answer was given by J. B. Neff in the Cultivator two years ago. Since that time the process has not been changed:

The commercial bleaching of walnuts is not practical in a small way, but the following formula and method may be helpful if only a few hundred pounds are to be processed and there is no association of which you can become a member. The walnuts must be perfectly dry before the bleaching is attempted. Twenty-five pounds of bleaching powder (chloride of lime), 18 pounds sal soda, 50 gallons of water. Made by dissolving the bleaching powder in water, allowing insolubles to settle; then draw off the clear liquid and to it add the dissolved sal soda; agitate, and then allow the calcium carbonate to settle; draw off the clear liquor and make up 50 gallons with water. This should weigh about 425 pounds avoirdupois. To bleach.—Use this liquor, adding sulphuric acid (strength 43 degrees B) in such quantity as not to amount to over .15 of one per cent absolute sulphuric acid in the whole bleaching mixture—in other words, to the 425 pounds bleaching liquid add one and one-fourth pounds of sulphuric acid of strength 43 degrees B, i. e., 50 per cent acid. Dip the nuts five to ten seconds; then wash with water and dry at once. Do not use metal containers for the liquid at any time nor metal baskets to dip the nuts.

Cherry Not Bearing

I have a large Black Tartarian cherry tree on my property which blooms profusely every year, but fails to set any crop. Will you kindly tell me what the probable cause of this lack of crop production is?—Subscriber?

This question was referred to L. D. Batchelor of the Riverside experiment station and he writes:

"The Black Tartarian cherry, like many other sweet cherries is self-sterile, that is, it will not set fruit when the blossoms are pollinated merely with its own pollen. It requires the introduction of pollen from another variety to cause the fruit to set. The work of the Oregon experiment station, published in Bulletin 116, shows that Black Tartarians are readily cross pollinated with either one of the following varieties: Bing, Lambert or Napoleon. The Lambert probably being the best adapted to this cross pollination. If, therefore, you will topwork part of your cherry tree to one of these varieties, or if there is sufficient room, plant a Bing, Lambert or Napoleon tree, I think you will find when this new variety comes into blossom that your Black Tartarian will probably begin to bear. For the time intervening before the blooming of the topworked portion of this tree, or the young tree, I think you can obtain a small setting of Black Tartarians by simply placing a "bouquet" of flowers of one of the three varieties mentioned above, in a can of water, in the Tartarian tree. If any of your neighbors have these varieties available, it will surely be worth while for you to try this temporary means of obtaining a setting of fruit. This "bouquet" method is actually practiced to a considerable degree in some orchards where the White Winter Pearmain apple has been planted in solid blocks. This variety is self-sterile, but will produce fairly satisfactory crops with the aid of "bouquets" of Yellow Newtons placed among the trees during the season of full bloom."

Rabbit With Caked Udder

I have a doe that has a litter of seven rabbits about three weeks old, and the milk is caking in her teats. First one and now another has started. I have been rubbing warm lard on them, but it doesn't seem to soften them any. She is very much of a pet and I hate to kill her if there is any way of helping her. I would be very thankful to you if you could tell me, through the Cultivator, of something that would help.—Subscriber, St. Helena.

Caked udders and teats are often found in nursing mothers in all animals. A good bag ointment, used according to directions, will relieve the congestion. Give plenty of exercise and good nutritious food as a preventive. Before litter comes, feed doe some green food and barks of trees to furnish nature's remedy for many rabbit ills.—W. D. W.

Raising Rabbits

Please give best method of raising rabbits. Is it profitable?—Subscriber, Baker, Oregon.

A large subject to cover in one article. Many things are necessary for a rabbit raiser to know, but the writer will not attempt to cover them all here. Four things are absolutely essential to bring success, stock pure bred, hutches comfortable and clean, feeding right, and general care good. Begin with one buck and four to six does of as good pure bred stock as your pocketbook will permit, and bought of a reliable breeder. If possible, secure unrelated stock unless stock is line bred; then secure pedigrees and follow out lines used by breeder. There are many plans for hutches, but in all events have no drafts; ease of operation and cleaning; closed sides and backs with open fronts are best; floors solid and slanting—two inch fall in three feet from front to back, three feet deep and three to four feet long, 18 to 20 inches high, single, double or triple tiers as one may desire. Feed good lean hay and rolled barley with green feed two or three times per week. This menu can be varied with different grains used sparingly in the rolled barley. Give water clean and fresh daily, in hot weather oftimes three or four times per day. As to general care, feed regularly, clean out hutches and yards often, use a good disinfectant, especially in damp places, remembering that good care and good feeds are the best preventives of disease. As to further directions, buy a good rabbit book and read it, and then read it again and again. Ponder well what you read from magazines and if possible belong to a good live rabbit and pet stock association. Nothing pays so well for labor and study as raising rabbits.—W. D. W.

Ear Ticks

Enclosed find bugs which go into dogs' ears. Can you tell me what they are and how I can get rid of them? They stay under the house where no one can get with the exception of a small animal. I am afraid they may come through the floor and crawl on the children. I have tried

sheep dip, but it won't kill thom, and the dog's ears on the inside are all raw.—Subscriber, McFarland.

The first step would be to clear the dog of the pest, and in removing the ticks from the ears care should be taken not to break off the head and leave it fastened in the ear. If this is done blood poisoning and sometimes serious abscesses result. Tobacco solution applied to the ear causes the ticks to loosen their hold, and they may then be removed. The place occupied by the dog should be cleaned out and, if possible, this may be made more effective by burning sulphur in a tightly enclosed apartment.

Cottony Cushion Scale

Am sending twigs of a lemon tree infested with some kind of bug. Will you please tell me what it is and what I could do to get rid of it? It is also on a pear tree.—Subscriber, Oceanside.

This is a serious infestation of fluted or cottony cushion scale, icerya purchasi. At one time this pest threatened the orchards of California. A natural enemy was introduced from Australia in the vedalia cardinalis. This little beneficial insect is still in the state and if not available elsewhere may be secured by writing Harry S. Smith, State Insectary, Sacramento. However, these specimens were submitted to Los Angeles County Commissioner Ryan and he finds several internal parasites already working on the scale.

Tomato Blight

Will you please tell me what tomato blight is and if there is any remedy? We lost one-half of our crop last year.—Subscriber, San Jose.

The true fusarium blight, sometimes called summer blight, yields to no treatment, for when it begins to show in the curling or wilting leaf the roots of the plant are past saving, for the disease has so affected them that they are unable to take up moisture. The only successful method is to get disease free seed, plant in disease free seed bed and on land which is not affected with the disease. The late or fall blight is a fungous trouble, however, which is liable to occur after warm rain or a series of warm foggy mornings. This may be prevented by spraying with a weak Bordeaux mixture.

Onions and Garlic

Kindly give me a little advice on onions planted from seed in Northern Ukiah Valley. Soil is red (diluvian), quite moist land. What kind of onion would be best for that soil and when would be the best time to plant to avoid frost and still get benefit of rains? No irrigation on land. Does garlic do well on such land, and how many pounds are required to the acre and also time for planting?—Subscriber, San Francisco.

Regarding growing onions from seed it is rather late to sow now, December and January being the best months to sow for main crop onions, the earlier varieties, such as Early Red and Crystal White Wax, being sown even in September, the crop maturing in May or June. You need have no fear of frost, as the onion is an extremely hardy plant. Your soil if well worked over with the plow disk and harrow, providing, of course, that it has not been previously over cropped, should be rich enough to produce a good onion crop, but for this season we would advise planting onion sets grown the previous season from seed. Plant an inch or so deep, six inches apart in rows 18 inches apart. You may secure sets of the Brown Australian variety or yellow from your seedsman. It will be necessary to plant at the rate of 250 pounds of sets per acre, and you should lose no time in planting if you wish to take advantage of present favorablo moisture conditions. Garlic is grown from small bulbs or sets taken from the compound bulbs you may secure from your seedsman or produce dealer. These bulbs are divided. The outer bulbs are best for planting. Your soil will also be suitable for this crop. The same culture may be observed as given above and the crop may be harvested when the tops are dried off, when the bulbs should be stored in a dry place. Thorough cultivation between the rows to conserve moisture during the growing season is essential for success.—A. R. G.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Adoption of Child

If I adopt a child, taking out legal adoption papers and giving the girl my name, will her adopted name be legal under all conditions in California? Can she claim the property of her adopted parents if no will or deed is left and there are other blood relations (not sons or daughters), who may come in and claim the property after the death of her adopted parents? If she cannot claim this property in California after their death, what course would the parents need to take while living to make their property secure for her? Would a will made in her adopted name be legal?—Subscriber, Fullerton.

A child when adopted may take the family name of the person adopting. After adoption the two shall sustain towards each other the legal relation of parent and child and have all of the rights and be subject to all of the duties of that relation. The parents of an adopted child are from the time of the adoption relieved of all parental duties towards and all responsibility for child so adopted, and have no right over it. The most frequent attack in the cases of adoption where there is no will left is to in some means invalidate the judgment of adoption. It would, therefore, be a matter of caution for the parents to make a will in favor of the adopted child, as otherwise some portion of the property might go other than it was desired. The laws of adoption in every state differ more or less, so that the above rules apply to California, but may be taken as generally applicable to other states.

Stock in Corporation

In a California corporation some of the stockholders paid in more money for the expenses of the company than others, for which they took the company's stock at par. Later when the company had a surplus for a dividend they wished to turn the stock back and get their money back. Could the directors legally accept the stock and give them back the money?—Subscriber, St. Paul.

Having paid for the stock, they have purchased an interest in the corporation for which stock has been issued. The directors would have no power to reduce the capital of the corporation thus acquired or to divert any portion of that capital to any certain individuals. If they did the directors would be individually and personally liable for the full amount of the capital so paid in the suit of any stockholder or creditor.

Widow's Share

In case a woman marries a man with children, what portion of the estate would she inherit upon his death in case he left no will?—Subscriber.

The estate of the husband being all separate property, upon his death without will, in case there was one child, the property would go in equal share to the surviving wife and to the surviving child. In case there is more than one child, one-third of the property would go to the surviving wife and tho remainder in equal shares to the children or issue of any deceased child. The property being all separate property, it is, however, absolutely subject to the disposition of husband by will and he could in such will provide any different proposition, could absolutely disinherit either the wife or the child.

Desert Land Act

What are the purchase provisions of the desert land act?—Subscriber.

If the question means what money would it cost to take up land, the provisions of the act are as follows: Upon filing the claim to desert land, the party taking up the land must pay 25 cents per acre for the total number of acres embraced in the application. Thereafter each year, for at least three years, he must expend not less than $1 per acre for the purchase of water rights or in the reclamation and cultivation of land. At any time after filing the declaration and within a period of four years thereafter, upon payment to the receiver of the additional sum of $1 per acre for said land, the patent shall issue in case the reclamation and cultivation has been made as required by the act.

Grind Your Roughage into a Balanced Ration

Cut Your Feed Costs 20%!

That's what you can do! With a Letz Feed Mill you can UTILIZE your waste feed stuffs, save the 20 per cent of grain which fed unground goes through the animals UNDIGESTED—and raise thriftier, more profitable stock.

Farmers and stockmen everywhere are doing it. And they are doing it with a LETZ because of its advantages over all other processes.

Cuts, Grinds, Pulverizes All in One Operation

Beats all other processes in fine-cutting, light-running, durability, capacity.

And all is due to the famous Letz Patented Self-Sharpening, Steel Grinding plates with their thousands of keen-cutting, scissor-like edges. Grind everything—wet, dry or oily—and can't clog.

None like them. None so durable—so dependable—so satisfactory. Guaranteed to outlast three sets of ordinary plates. Supremacy PROVED by hundreds of thousands of Letz users.

With the Letz Dixie you can feed into two hoppers!

That's what you can do with the Letz DIXIE—you can feed snapped corn, alfalfa, kaffir corn, corn fodder into the feed table; and feed ear corn, oats, wheat, barley or any small grain into the BIN. And out comes a fine nourishing combination feed, ground fine in one operation, a feed that fattens your stock on material hitherto thrown away! There's a Letz Mill

Cutter and Recutter Combined for Heavy Cut.

For Every Farm and For Every Grinding Need

Letz Mills are made in 9 sizes, 22 styles for power ranging from the small hand-power machine up to the big mill driven by the farm tractor. Every mill backed by 29 years' experience. Guaranteed to excel in service, saving and satisfaction.

Sweet Potatoes

By Ernest Braunton

THE planting season for sweet potatoes is nearly here and Nancy Hall is the best variety to use. Unless you are well equipped for producing your own plants it will be better to buy them from the seed stores. Millions of plants are so handled every year. In those parts of the state having warm spring weather the plants may be started in a sunny exposure, in sand, but often this method brings the plants too late and a good hotbed is preferable. If inconvenient to make one and tend to it every day, you had best buy your plants. Seeds are not for sale.

A hotbed may be any size or shape. If against a building, fence, or other structure, three to four feet is as far as one can conveniently reach to break off the shoots. It may be built above ground, but the heat will be better confined and conserved, if in a pit, and this should be about two feet deep. If manure is plentiful you may use more and not dig a pit, but have the area greater, and you will have to make a frame to put on top. So perhaps a pit is more economical. Fill the pit with the manure or you may put cereal or bean straw in the bottom and tread it down until it is six inches deep. Then put on the manure until within six inches or so of top of pit, treading it heavily and laying it smooth and even. Next put on three inches of any soil, but sandy if you have any choice. Lay your potatoes on the soil; if very large, cut in two and lay with flat sides down, close together, and cover with two to three inches of soil or sand.

Another Method

To propagate without artificial heat select a place that is warm and sheltered, where the sun will strike all, or nearly all, day. As the first of April is the time to start such bed, a warm place should be easy to find. Spade up the soil as deeply as possible and rake it smooth, but do not tread it down, for we should have drainage and air freely. Place your potatoes on this bed, close together. Or, if sand is available, sprinkle some over soil before placing potatoes. It will be better if you make a frame of six inch boards for a bed margin and put the potatoes inside this. Cover them with fine sand two inches deep if you can get it, or sprinkle them over with sand, if available, and cover with the lightest soil you have, not less than two inches deep.

With either method give one good watering and then watch closely until the sprouts show to see that soil does not get dry, but do not keep soil wet, for all the heat possible is needed and heat is neither in nor can it get into a soggy soil. After the shoots show, watering may be more free; there is greater need of it. Some growers transplant the sprouts direct to the field, but the better practice is to break them off and set them in the soil an inch or two apart over as large beds as you wish. They rapidly make such a mass of roots that transplanting is a safe and easy operation. When set in the field they are planted on ridges two and a half or three feet apart. These ridges are made by various implements, but all are generally sharp and uneven on top. A plank smoother to ride on two or more ridges at once is run over them to make flat and smooth. The plants should be set in a row in the middle of the flattened ridges, about 15 inches apart. In the garden the ridges are raked smooth and each plant watered by hand as soon as a row is set. In field practice irrigation precedes and follows planting. A stream is run down on one side of a ridge and the planter and assistant work in the next furrow. As soil must be sandy, it is easy to handle. One person goes ahead of the planter, makes a hole for a plant, dips water into it from the opposite trench, and so proceeds down the row. The planter closely follows, puts his plant down into the mud and throws in a handful of dry soil. The water is then turned into the furrow just vacated by the planter and success thereby assured, for the sweet potato needs lots of moisture. Irrigation and culture throughout the season vary with the texture and needs of the soil, but weeds must be kept down and soil must always be moist not far below the surface. About April first is soon enough to plant your "seed" bed.

Sugar Beets in Australia

CULTURAL methods in the southern hemisphere have certain interest for those of us who are on the other side of the line. In sugar beet culture there is so much of hesitation, even of distrust, that planting will be very materially reduced the present year. On the other hand, in Australia the interest seems greater than ever before. In discussing the sugar beet industry and in giving cultural directions the Journal of Agriculture of Victoria, a government publication, has this to say regarding soils and cultural methods in that country:

Rich sandy or silty loams and heavy loams with a good depth of soil and comparatively free subsoils are desirable. A good type beet must root deep, so that waterlogged areas and soils with an impervious hardpan near the surface are unsuitable unless such faults are corrected. Raw peat lands are not desirable. Sandy heath lands often produce impoverished or stunted beets high in sugar content.

Cultivation

Where convenient the beet land should be deep plowed or plowed and subsoiled in the autumn up to 12 inches and allowed to mellow during the winter. In the early spring the area should be surface cultivated or shallow plowed and brought to a fine tilth, with a well firmed soil and a fine seed bed. Good preliminary cultivation is a long step towards success and economy in growing the beet crop.

Seeding and Fertilizing

Seeding should immediately follow the final cultivation of the seed bed in order that the weeds may have no advantage over the beet seed. If the soil is dry, free and warm, sow on a rolled surface; if moist and disposed to cake, plant on a harrowed surface about one-half inch deep for early sowings. Sometimes growers plant the seed very deep in loose soil and generally secure a slow, thin, unsatisfactory germination. A special four row beet seed drill is used, with rows 18 to 20 inches apart, the most favored widths for yield of sugar per acre. About 12 pounds of seed is sown per acre because it is necessary to secure a rapid, strong germination, the germinating seeds helping one another through.

Superphosphate is drilled in beforehand or with the seed and has proved beneficial to the growth of the plant without disturbing the sugar content and purity of the beets. The quantities used locally range from one-half to two hundredweight per acre.

The beet uses up a quantity of potash which would probably have to be added in the form of sulphate of potash in most well established beet areas. By plowing in the beet crowns and tops a great part of the plant food absorbed by the beets may be restored to the soil. Beets thrive in well limed soils, and growers have not yet seen fit to use the mill waste lime as freely as they should.

Cultivation

Early plantings should germinate in two weeks, late plantings in a week, and directly the rows are defined the area should be rolled and followed by four row beet cultivators fitted with special sweeps that will cut very close to the rows without disturbing the beets. This first cultivation can hardly be done too early and is most important in checking the weeds, giving the beets a strong, clear start and making thinning easy and economical. The growers who neglect or delay their first cultivation almost invariably pay dearly for it subsequently. The

intertillage is not costly, as a four row machine will comfortably do ten acres a day and should be applied after thinning and after rain as frequently as necessary to keep the soil in the best condition and free of weeds.

Thinning and Side Hoeing

Beet thinning is the principal hand work, and is done by casual labor on contract. As a rule it is best for the grower to devote his own time to the cultivation work and have the thinning done quickly by contract labor at the ruling rates.

Thinning should be done soon after the first cultivation and commenced while the beets are quite small, as young beets are easier to thin than forward beets and such thinning is more satisfactory for the contractor. If delayed the weeds soon develop and the beets get overstrong and are difficult to handle, thereby adding to the cost of thinning. The absorption of moisture by a full stand of beets allowed to remain too long unthinned is a heavy pull on the soil and will invariably reduce the yield of beets to a tonnage considerably below those sections thinned at the correct period. Experience and costs have repeatedly shown that it is better to err on the early side than on the late side when thinning beets.

Thinning is done with short handled hoes to space the beets. The left hand of the operator is free to thin the beets to a single strong plant at distances approximately eight inches in rich, moist soil, ten inches in good beet soil, and 12 inches in medium or drier soils. Many thinners become very expert at the work and do as much as half an acre and sometimes more per day.

The development of single germ seeds would be a great advantage to thinning, and checkrow planting a possible improvement.

Side hoeing is done with long handled hoes a few weeks after thinning to remove all weeds growing in the rows, the cultivator destroying everything between rows. Side hoeing is frequently done by contract at prices varying according to the cleanness or otherwise of the crop.

Irrigation

Although the beet crop holds remarkably well through dry periods because of its deep rooting propensities, irrigation is undoubtedly very desirable in some districts. It is a summer crop that absorbs a large quantity of moisture, and if by irrigation an abundance of this can be supplied during the youth of the plants to keep them growing freely without any check, much better quality beets will be secured than if the plants are severely checked by lack of moisture in the summer and subsequently develop an abnormal growth in the autumn. High quality beets need an abundance of moisture during the spring and early summer and comparatively dry conditions towards autumn in order that high sugar content and purity may be encouraged to the utmost. This can best be regulated by irrigation. Any system of irrigation may show good results but undoubtedly the furrow system is the best. Every second row should be furrowed out with irrigation shovels placed on the cultivator. These furrows should be connected with the service channel or pipe, and water admitted in sections, as many rows as the water will supply being irrigated at one time. In this way the water may be well controlled and through the loose furrows it soaks well down to the subsoil without smothering the leaves, and very soon after the furrows may be cultivated to conserve the moisture.

Harvesting

A special two point beet lifter is used to lift the beets, or a single furrow plow stripped of its moldboard. The topping is done by contract at a price per ton depending on the yield, and occupies a number of men. The beet toppers pull and shake the loosened beets and throw them into rows. Then with large beet knives they slice off the crown and tops, throwing the roots into heaps. The carters fork the beets into drays, haul them to the factory or railway siding, have them weighed and tared for dirt and faulty topping and tipped from high beet loading platforms into trucks or dumped direct into the beet bins ready for manufacture.

Excepting the crowns and tops, which remain with the grower as valuable stock feed the whole bulk of the crop has to be carted, and it would generally be considered unprofitable to cart beets more than five miles by road. The limits by rail depend on freight and loading conveniences. A good average yield of clean beets is 12 tons per acre, but a diligent grower should expect to do better than this.

General Considerations

Good cultivation is essential to beet growing, and this is the main reason why beet growing improves the soil for other crops.

Fertilization is very desirable, and growers have now come to realize this and seldom plant without fertilizers.

The application of lime is good policy but not yet practiced to any extent here.

Irrigation is the best assurance of consistent and profitable yields, and with a large irrigation system in course of construction for this district it should benefit beet growers.

Systematic rotation of crops is very important but rarely practiced, partly because farmers have been fortunate enough to get along all right without it. But as reducing areas, higher values and increasing costs come into conflict with decreasing fertility, rotation will find its proper place in the maintenance and improvement of the productivity of the soil. Mainly have beet growers neglected rotation because they have to lease land at high rentals for short terms and are compelled to grow beets on the same land from year to year. Although continuous beet cropping is bad practice and not approved, it is interesting to note that in spite of those who contend that beet growing injures the soil, sugar beets have now been grown on some lands for six consecutive years and produced good crops every year.

A farmer who follows diversified farming and rotation is well advised to give his best attention to five or ten acres of beets rather than indifferently care for larger areas. A grower who is experienced and devotes himself almost wholly to beet growing need have no anxiety about handling 100 acres.

Beet thinning is the main cash item of expense in the early stages, and the factories generally advance on any well cared for crop sufficient to meet this expense. As soon as deliveries commence growers secure progressive payments to meet the cost of harvesting.

In America there are now being fully tested two beet harvesting machines designed to mechanically lift the beets, top, and place them ready for carting. These show great promise of success, and, if so, they will be a great economy, convenience and encouragement to beet growers.

FLATTERED

"It used to please me when I was a youngster," said Olden, "to have the barber ask me if I wanted a shave."

"Yes-"

"Yes; and now he sometimes flatters me by asking if I want a hair cut."—Public Ledger.

Do not let the strawberry bed become too thick with berries. A frequent trimming of the runners will prevent this.

Do You Know—

STANDARD PRACTICE

The use of Timken Tapered Roller Bearings at points of hard service in the great majority of motor vehicles is proof of leadership established on the tapered principle of design, quality of manufacture, performance on the road, and service to the automotive industry

that the motor car is the one farm investment that pays dividends to the small farmer and the large one, whether he grows wheat or garden truck, whether he has a thousand acres or a dozen?

that there is one single requirement which means more to these users than all the rest put together—and that is *reliability?*

that reliability is the main reason for the adoption of Timken Tapered Roller Bearings by the great majority of car builders?

that Timken Bearings are reliable under all conditions, and that the tapered roller bearing is the type that will function properly under radial load, or thrust load, and all possible combinations of the two?

that 85 per cent of the cars built this year have Timken Bearings at the points of hard service?

THE TIMKEN ROLLER BEARING CO.

Timken Tapered Roller Bearings for Passenger Cars, Trucks, Tractors, Farm Implements, Machinery, and Industrial Appliances.

TIMKEN BEARINGS

Agri GYPSUM

Great acres of black alkali land are being reclaimed by the use of gypsum. If your land is saturated with black alkali, apply AGRI GYPSUM which will neutralize the effect of the alkali, making good crops possible.

Heavy production resulting from fertilization.

California crops especially benefited by AGRI GYPSUM include:

Alfalfa	Cotton	Napier
Beets	Cabbages	Barley
Beans	Cauliflower	Citrus fruits
Barley	Vetch	Deciduous fruits
Potatoes	Melilotus	Milo
Peas	Peanuts	Cantaloupes

Among the above, alfalfa, beans, cabbages, citrus fruits and deciduous fruits can be benefited by application of AGRI GYPSUM at ANY TIME during the season.

Use AGRI GYPSUM under trees close up where it is difficult to turn cover crops under. This is an important place to feed a tree, an easy place to put AGRI GYPSUM and where it is difficult to place other materials. AGRI GYPSUM releases bound up elements in the soil, helps to set free all the nitrogen, calcium, sulphur and other crop growing elements.

This year when other fertilizers are scarce and high AGRI GYPSUM will make your available plant food go farther and it leaves the ground in friable condition.

No other crop is more benefited by AGRI GYPSUM than alfalfa, as alfalfa requires a great amount of sulphur and AGRI GYPSUM contains a high content of sulphur.

Ask your dealer for AGRI GYPSUM and you will be sure of the product ground fine to do the most good with the least amount used. An illustrated booklet sent free on request.

If your dealer does not handle AGRI GYPSUM write direct to

UNITED STATES GYPSUM CO.,

American Farm Bureau Federation

By Robert W. Hodgson

BY a unanimous vote of 400 delegates representing the 28 states which had ratified the proposed constitution, permanent organization of the American Farm Bureau Federation was effected in Chicago, March 3. The total number of voting directors to start off the organization, one from each state and one from each 20,000 paid up members, came to 53, the two from California being President W. H. Walker of Willows, of the California Farm Bureau Federation, and Geo. H. Sawyer of Waterford. A careful estimate of the paid up membership of the new organization shows better than 700,000 to start off with, and it will undoubtedly soon reach the million mark, with many states now actively conducting membership campaigns.

Outstanding among the states represented in point of membership was Iowa, with 104,383 paid up members, many of which, it is stated, are signed up for life. New York came next with 67,000 members, followed by Illinois with 50,000; Missouri, 34,000; Michigan and Indiana, 31,000 each; Ohio, 30,000; California, 19,000; Minnesota, 17,000; West Virginia, 15,000; Nebraska, Idaho, Kansas and Massachusetts, 14,000 each; Utah, 12,000; Kentucky and Vermont, 8,000 each; New Hampshire, 6,000; Maryland, 5,000; Colorado, 4,000; South Dakota, 3,000; Wyoming, 15,000; Arizona, 1,200, and New Jersey, Georgia, Oklahoma, Connecticut and Texas membership not reported. The total budget for the first year was fixed at approximately $200,000, and work outlined to cover most of the budget.

A particularly striking feature of the conference, which lasted two days in Chicago and then adjourned to Washington for three days more, was the complete harmony which reigned among the directors. The absence of the bitter controversy which characterized the previous meeting was most pronounced and significant.

Permanent organization completed, the federation went to work at once. James R. Howard of Clemons, Iowa, temporary president, was confirmed as first president at a salary of $15,000 with $3,000 for traveling expenses. S. L. Strivings of Castile, New York, was elected vice-president, and J. W. Coverdale of Ames, Iowa, permanent secretary. Executive committee members were elected by regions as follows: Northeastern section—E. B. Cornwall, Middlebury, Vermont; E. F. Richardson, Millis, Massachusetts, and H. E. Taylor, Freehold, New Jersey. Middle West section—O. E. Bradfute, Xenia, Ohio; Chester H. Grey, Nevada, Missouri, and Howard Leonard, Eureka, Illinois. Far West section—W. H. Walker, Willows, California; W. E. Jamieson, La Veta, Colorado, and John F. Burton, Garland, Colorado. South section—Grey Silver, Martensburg, West Virginia; James W. Morton, Athens, Georgia, and George Bishop, Cordell, Oklahoma.

An important change in the constitution is in the membership fee. The original provision assessed ten per cent of local dues for the national federation. This was changed to a flat rate of 50 cents per member for the year 1921.

A comprehensive program of work was laid out in the form of recommendations made to the executive committee and left to the direction of this committee. The plan is for the organization of bureaus of publicity, trade relations, distribution, statistics, legislation and cooperation, as indicated in the recommendations given to the executive committee. It is instructed to set up without delay a business organization under direction of trained experts and create bureaus or divisions as follows:

A bureau of transportation which will look into transportation matters by both rail and water, to the end that we may secure rates on farm products which shall be fair as compared with rates on other commodities, and which shall give the farmers of the United States ocean rates which will enable them to compete on a fair basis with the farmers of other nations of the world.

A bureau of trade relations which shall investigate our dealings with foreign countries to the end that the interests of agriculture may be promoted.

A bureau of distribution which shall make a thorough study of the distribution of farm products.

A bureau of statistics which shall inquire into world conditions which influence supply and demand, and which shall especially study the mechanics of prices.

A legislative bureau which shall have to do with matters of national legislation which affect farming and farmers.

A bureau of cooperation which will make a special study of cooperative methods which have been found successful both here and in other countries, and which shall draw up standard forms for cooperative enterprises of various kinds and aid state federations to promote local cooperative enterprises on thoroughly safe and truly cooperative lines.

After passing a number of resolutions, a digest of which will be found below, on the urgent invitation of Hon. E. T. Meredith, new secretary of agriculture, the entire executive committee made a trip to Washington, where three days were spent. A Washington representative was arranged for and appointed, a hearing held before the agricultural appropriation committee, a bureau of publicity and federation headquarters established at Washington and a thorough survey made of the work of the department of agriculture.

Executive headquarters have not yet been selected, but will probably be in one of the following three cities: Indianapolis, St. Louis, or Chicago.

Resolutions

The resolutions set forth in very definite terms a pledge of full support to the constitution of the United States, condemning radicals and reactionaries.

Increased production is essential to national well being. We stand for higher individual efficiency. In determining a compensation we believe that the result of the day's work, rather than the hours thereof, should be of paramount importance.

We pledge the farmers of America to the largest possible production consistent with good husbandry, with a view of relieving the world's dire necessities, and invite the workers of all other industries to join us in this spirit of service.

We declare the strike no longer justifiable and no longer to be tolerated by a long suffering public.

We favor the creation of such arbitration boards or courts, with power and authority, to adjust controversies between labor and capital as shall safeguard the rights of the parties directly interested, as well as the welfare of the general public.

Realizing the need of trained workers and a healthy citizenship in all walks of life, we urge such general course of instruction of our young manhood as shall call attention to and give promise of relieving general health conditions throughout the country.

We hail the American Legion as one of the most important factors in the life of America, pledge our support in its great work and welcome it to comradeship.

We pledge the full strength of this institution and its individual membership in support of the good roads movement throughout the country.

Deploring the waste and extravagance of the present day, we urge the necessity for a return to the more humble and prudent practices of the past.

Our country needs stability and the brakes must be applied to secure that much desired result. Waste breeds recklessness, a lack of responsibility, and is the best aid to the profiteer whose selfishness knows no country and who has no regard for the rights of the masses.

We recommend legislation providing that the presence of all substitutes for virgin wool in fabrics and apparel purporting to contain wool shall be made known.

We recommend that a committee be appointed to confer with the international revenue department in working

out a simpiified form for income tax returns for farmers.

We definitely and emphaticaiiy oppose the proposed iegisiation to levy a tax of one per cent on iand holdings in excess of $10,000.

We demand for agricuiture, at the hands of state and nationai iegisiative hodies, the priviiege of coiiective bargaining.

We insist that in ail tariff iegisiation, agricuiture be given equal consideration with other industries.

We wish the American people to definitely understand that the organization seif styied "The Farmers National Council" has no authority to speak in hehaif of the farmers of this country.

Any and aii efforts on the part of The Farmers National Council to aiiy the agriculturists of America with the radicals in the industriai worid is herehy denounced.

EXPANDING BUSINESS

We have a letter from J. E. Bergthoidt, for many years at the head of the Siiva-Bergthoidt Company, in which he makes reference to "unscramhiing the active hranches of our husiness." This concern has heen known to many of the Cuitivator's readers as a great nursery firm, hut many have not known of some of its other lines of activity. The same institution has heen in active control, not only of iarge nursery interests, hut of even larger interests in fruit growing—having large ranch properties—fruit packing, shipping and seiling, and large mercantiie estahlishments of Newcastle. The "unscramhiing" consists of organizing three separate and independent corporations — the Siiva- Bergtholdt Fruit Company, capitaiized for $250,000; the Silva-Bergthoidt Nursery Company, capitalized for $250,000, and the Silva-Bergtholdt Hardware Company, capitalized for $50,000.

The active management of the Siiva-Bergtholdt Fruit Company will be in charge of J. M. Stacker, for several years manager of the Newcastle Fruit Growers Exchange, a man of large experience in the fruit industry and thoroughly qualified and competent to act in the new responsihility which he is assuming. Mr. Stacker has tendered his resignation with the Fruit Growers Exchange, taking effect April 1, when he assumes his duties as general manager of the Silva-Bergtholdt Fruit Company.

The Silva-Bergtholdt Nursery Company wiil continue under the active management of J. E. Bergtholdt, aided by a corps of efficient assistants.

It has heen the poiicy of the Silva-Bergtholdt Company for several years in the past to pay their employes a iiberal honus on salaries, and by this means they have heen enahled to create a loyal and efficient corps of empioyes—ail of which has made for efficiency in the husiness of the concern. The new corporations will continue this plan, or, still hetter, wiil make the employes stockholders.

The story of a barefoot boy is always of interest, so here is a hit of human interest stuff furnished to us regarding such a youngster landing in California many years ago.

J. E. Bergthoidt, under whose sole acting management the business has heen built up to its present proportions, "blew" in from the prairies of Western Kansas and landed at the foot of Market Street, San Francisco, at the age of 14.

Three years later he drifted into Vaca Vailey and hegan his original venture in the fruit business on a sole triangular investment of a husky appetite for a joh, 17 birthdays, and a roll of hlankets, successively graduating from punching mules, pruning trees, loading cars of fruit and keeping hooks for several fruit shipping concerns.

In 1899, on an investment of $500, together with Ed B. Silva, the present business of the Silva-Bergtholdt Company was founded hy the commencement of a business in the express shipment of fruit in competition with numerous iarge and long established fruit shippers in what was then deemed the losing branch of the fruit shipping business, engaging at that time simultaneously aiso in a small way in the nursery business, which, under the then existent conditions, was also deemed a poor man's venture.

That initial investment and the accumulation of 20 years of hard work are represented today in the extensive merchandising business at Newcastle; a nursery husiness making Siiva-Bergthoidt Company's foothili grown trees a household word in every home in Caiifornia; an express fruit shipping husiness piacing the hrand of the Silva-Bergthoidt Company on the counter of every groceryman and fruit dealer throughout the territory west of the Rocky Mountains and east of the Sierras hetween the Canadian and Mexican line; a carload fruit shipping business extending throughout the markets of the East; and an orchard husiness operating, under their ownership over 1,050 acres of orchard and, in addition, three to four hundred acres under lease.

INOCULATION IN SOILS

The practical importance of soil bacteria is just beginning to he recognized. It is now known that normal soils contain many kinds of bacteria as weil as other lower organisms, hoth animal and vegetahle. Many of these organisms are heneficiai to the useful plants, some are positiveiy essentiai, and others are seriously harmful. Certain ones are without effect in themseives, hut are of importance through their action in encouraging or destroying those which are directiy effectuai. The composition of the soil constitutes a veritabie iittle worid of itself. Constant reactions and changes are going on, aii of which are of the utmost importance to agricuiture.

The practical possibility of infiuencing these actions and reactions appears to he great. Many chemicai suhstances are known to he influential in stimuiating or suppressing specific groups of organisms. However, the selection and deveiopment of particulariy active or resistant varieties of bacteria is just as possihie as the deveiopment of desirahle varieties of higher piant life.

The great improvement of fermentation yeast which has heen accompiished hy the hrewers and bakers is a case in point. If, for instance, the weil known group of soil hacteria which have the power of producing nitrates through the fixation of atmospheric nitrogen could be improved to the extent that has heen attained in the case of yeast, it wouid he possihle to fix in the soil itseif sufficient nitrogen for the needs of agricuiture.

It has been demonstrated that growth and nitrogen content of aifaifa piants on siit loam soii are greatly increased by inoculation. A remarkahie increase in both yield and quantity of nitrogen was aiso caused through inocuiation in the case of soy heans. In Plainfield sand an enormous increase of nitrogen in the piant was noted, especiaiiy after the second cutting.

Eiectro-chemistry has heen advocated as a soiution for the nitrogen prohiem. However, in the face of resuits such as have already heen obtained hy inocuiation, it seems not at all improhahle that the permanent solution wiii be found in the manipulation of soil bacteria.—Aifaifa Buiietin.

WILD HERDS INCREASE

In the ten years since the Montana national hison range was estahiished the 37 huffaioes with which the herd was started have increased to 296. In addition there are on the range 125 eik (not inciuding caives of iast year), 33 anteiope and 13 mule deer. It is helieved that the range is large enough to support 800 hison, 400 anteiope, 500 deer and 800 eik.

HUDSON SUPER SIX

Isn't This the True Mark Of Hudson Endurance?

No Stock Car Ever Equalled Its Official Records In Speed - Hill - Climbing, Acceleration, Endurance

In every performance asked of a motor Hudson's official records reveal greater ability than any other car has ever shown.

They have stood for five years. They are not held by hairs'-breadth, but by big, convincing margins, before which argument is dumb. They prove the master type, with limits of power speed, and endurance that none has matched to this day.

Yet if they stood for only contest supremacy, they would have small importance to you.

In all the years your Hudson serves, you will hardly require its full capacity. You do not want 80-mile-an-hour speed. You will scarcely encounter a situation to tax its limit of power.

These Qualities Count in Every Day Service

Of course, there is pride in possession of car qualities you know are unexcelled. And this performance mastery gives innumerable advantages. For instance, you travel faster within the speed limits. That is because you are away quicker. You pick-up faster. You have power that levels hills with ease. You have smoothness that makes the long journey comfortable and free of fatigue.

But you will have far more occasions to admire Hudson's superb riding ease, its good looks, and its trustworthy dependability, than its more spectacular qualities of great speed and power.

So, it is chiefly as they reveal its basic principle of supremacy — the control of vibration—that the Super-Six's world famous records are important.

Endurance Gave It Mastery

The exclusive Super-Six motor adds no weight or size. Yet it adds 72 per cent to power, and 80 per cent to efficiency. It almost doubles endurance. It does this by converting to useful power the destructive force of vibration, which uncontrolled quickly undermines motor endurance.

That is why the Super-Six can go faster, farther and lasts longer.

These are official proofs. All can verify them.

By no possibility will all who want Hudsons be able to get them.

You should place your order now for your Hudson, even though delivery is not desired until summer.

Hudson Motor Car Company, Detroit

Materials for Garden Building

By Ernest Braunton

THE most pressing question with the garden bulder is: What shall I plant? It is conceded by all that shade and shelter is a fundamental need, therefore let us begin with trees. Some places are in greater need of shelter than shade, and for such places a windbreak on two sides is necessary. As quick growth is usually the first consideration, we cannot do better than plant eucalypts. even though we make a secondary or more permanent planting.

Eucalypts are such great soil robbers that many plantations once considered a blessing are now being uprooted. This is especially true in vegetable growing districts, where the trees both rob the plants of food and shade so much soil that with the double cause for complaint the trees have to go. In the lettuce and cauliflower districts south of Los Angeles and in the potato and mixed vegetable sections of the San Gabriel Valley the eucalypts are rapidly disappearing, and their removal is costly. The question arises: Shall we plant eucalypts?

It may be better; if soil robbery is to be seriously considered, to plant a few rows of eucalypts farther from the dwelling and other buildings than first planned, and inside this line rows of a permanent windbreak. For eucalypts either the blue gum or red gum will prove the best, except in regions both too hot in summer and too cold in winter for these species. Here the E. viminalis will be found to meet conditions better than any other. Throughout the state generally the Monterey cypress has been a favorite windbreak tree, for it retains its lower branches and stops the ground currents, which the eucalypts do not. Where too cold for this species the Arizona cypress will prove hardy amid ice and snow. Olive trees have been used where a tall windbreak is not needed, and the dwarf blue gum is also excellent. Leptospermum laevigatum is a large shrub well adapted to the purpose, and in sandy soil, in coastal districts, a native beach shrub, Lavatera assurgentifolia, makes a good tall hedge. It is much in use about Compton, Los Angeles County, and proves very effective. It is also quite tolerant of alkali. In the acacia family there are both trees and shrubs for windbreaks that will grow in any soil or situation not too cold.

When it comes to the garden proper there are few families of trees that will prove so effective as acacias. Acacia Baileyana, A. dealbata, A. longifolia and A. cyanophylla all are beautiful, medium sized trees noted for their glorious crop of yellow flowers, and are splendid for grouping in the home grounds or to frame your yard or lawn. A more shrubby species is A. cultriformis, of a finer yellow, with small three cornered leaves of fine bluish green. But for hedges A. armata is a fine thick growing shrub with small thorns, an ideal plant for the purpose. In its native Australia it is much planted for hedges and is called the "kangaroo thorn." Out of all plant groups few have proved more popular than the acacias and all should have a closer knowledge of them. The species numbers about 550, and of these about 150 have been grown in California and nearly 50 of these are fairly well distributed.

But while we are framing our garden picture why may we not also grow something to eat? Some evergreen fruit trees and shrubs are hardy in nearly all parts of the state. Many more will grow and bear fine fruits where oranges are a commercial possibility. So that from San Diego to Chico we may grow avocados instead of magnolias in the warmer sections and sapotes and others will do as well, while budded and named varieties of loquats will grow anywhere in California, as will the fine varieties of the Paraguay guava, Feijoa Sellowiana. The strawberry guava makes a hedge of good size, while for a lower hedge, of two feet. Carissa grandiflora is a beautiful fruiting shub.

The pines and cedars, with their numerous relatives, should be used where climate will not allow tropical evergreen fruit trees, and no tree known surpasses in beauty Cedrus deodara, the giant cedar of the Himalayas. Two other species, one of which is the famed cedar of Lebanon. are nearly as attractive. California should grow them by thousands in every county in the state. Of pines there are a score of natives and others of great beauty. such as Pinus Canariensis. The cypress are available in a half dozen species and the Lawson cypress is one of the most majestic of trees. The California big tree thrives everywhere, and its cousin, the redwood, wherever fogs are heavy and soil fairly moist. The stately araucarias, the junipers, yews, firs and spruces must all be considered in the home grounds.

Before taking up the evergreen shrubs let us not forget that deciduous trees are sometimes needed to provide shade for summer while not shutting out the winter's sun. Here, too, fruit may enter, and what can surpass in beauty the walnuts and chestnuts? If for beauty alone the oriental plane, or sycamore, the soft and other maples, birches. catalpas, tulip tree, elms, oaks, poplars. mulberries, lindens, weeping willows, etc., are enough of a list for anyone. In deciduous snrubs we have barberries, deutzias, hydrangeas. philadelphus or syringa. spirea or bridal wreath and snowball. Others are to be had in a hundred species, but these are among the best. In evergreen shrubs there are so many we cannot list them, but there are those for every prospect. Some are so resistant to drouth that they need no water other than the winter's rains, and this is true of many evergreen trees. It is not true of many deciduous trees or shrubs. Eucalypts, acacias, carob, or St. John's Bread, need no summer water, and this is true of shrubby acacias, leptospermum. Spanish broom, bottle brushes. casslas. lantanas, oleanders and pittosporums. Do not be troubled about not finding enough suitable trees and shrubs; the variety is too great. Rather be concerned with what you should not plant, those weakly subjects that would need perpetual care and nursing. Plant none of them.

TOMATO CULTURE

Nothing is to be gained by planting tomatoes too early. Be reasonably sure that frosts are over before you set plants. While tomato plants consume much food, a very rich soil, containing plenty of humus, will give you vines rather than fruits. A rather "hungry" soil, naturally, with special fertilization, has given the best garden crops and should hold equally well for extensive field operations. It is not, however, good practice to grow tomatoes on any land for more than three years without alternating with some other crop.

One successful grower plowed an old truck garden soil up deeply, applied superphosphate broadcast to the amount of 500 pounds an acre, and harrowed the soil smooth just before planting. When the plants began to bloom he sowed 200 pounds per acre of nitrate of soda, first run through a screen so no lumps were possible. Two or three weeks later he again sowed a like amount, cultivating it once after each feeding. His success was good for the practice followed was based on 20 years in the growing of tomatoes for market. Above all, do not plant too early. The tomato requires much heat and in a cool spring or with early planting it has been proven that one planting will not bring a crop a single day ahead of plants set in the field two weeks later. For summer and fall crops seeds may be planted in seed beds from April to July, according to the time you wish the crop to mature.—E. B.

The Firestone Cord, showing heavy non-skid tread

The Firestone Park School is one of the most complete in Ohio

Firestone Park—and Most Miles per Dollar

All ideals that aim toward the general good, all practical efforts at community betterment, have a wide and far-reaching effect.

Firestone Park, a community of homes, churches, schools and all incentives to loyal citizenship—is an example of the way in which the Firestone organization shows itself mindful of the importance of the home in any great working group.

In Firestone Park are gathered together Firestone workers who are also owners of their homes and stockholders in the business.

They are united by every motive of personal pride to make tires of best possible quality at lowest possible cost. Firestone's resources in capital and workers such as these, create economies that are passed on to the car owner in more tire for the money—most miles per dollar.

FIRESTONE TIRE & RUBBER COMPANY, Firestone Park, Akron, Ohio

Firestone

Organization Has Benefited Bean Growers

By Joseph Rorke, Organization Manager California Bean Growers

THIS is the day and age of cooperative marketing; every few days we get news of another growers' association being formed. Recently the Michigan Gleaners Association, composed of 70,000 farmers, the majority of whom are bean growers, bought out control of the bean elevators owned and operated by the Lewellyn Bean Company. It has been said by large operators in Michigan that there would never be an association of farmers in Michigan. It has come to pass, the farmers there recognizing the fact that they should have a voice regarding what price their products should be sold for.

It was good news to get, inasmuch as the California bean growers and the Michigan bean growers are mutually interested and we presume to think that this will mean better conditions for one and the other. As an organization of bean growers, we will be able to keep one another posted as to crop and market conditions. This could not be accomplished if we had to try and procure this information from the bean dealer and the man who speculates with the product of the farmer.

The bean growers of the United States are just waking up to the fact that they must get together. What they have gone through this last two years has taught them that much and we venture to say that in the course of a short while we will see all the bean growing states formed into associations or marketing organizations.

The bean industry of California is of great importance and should bring to the farmers a price which will enable them to continue raising beans. The bean production of California ranks from second to fourth as to the amount of money it brings to this state. Is it not time for us all to get together and make the California Bean Growers Association one that will stand the acid test?

It is realized in writing this article that a number of you who read it will say to yourselves: "Well, it is all right, but what good has the association done us this year?"

Mr. Bean Grower, we want to emphasize the following facts:

The association started during a year when Uncle Sam said food will win the war and every farmer did his utmost to raise food products.

The bean crop of California was the largest that was ever known and the war still going on, it looked as though there would be a ready market for every bean that was raised.

You will remember in September of 1918 that we had heavy rains and all during the harvest it was more or less wet. This meant that at the time all the beans were in the warehouse, instead of having a product that was marketable, we had a large proportion of it rain damaged.

About the time our beans were in the warehouses the war came to a close (for which we were all thankful though we still had our crops on hand).

News came that practically all Europe was starving and that the United States would have to furnish them with food. Here we saw a ready market for our beans, but it seems that European countries, though they wanted our products, had not the money to pay for them. The rate of exchange dropped so rapidly that it was hazardous to do business with these countries and we were forced to look for other markets for our beans.

The market brightened up on beans and in eight or ten days the association sold at advancing prices to all parts of the United States. At this time our hopes ran high and we were wondering what next would happen. It came in the form of governmental inquiry into the high cost of living. This inquiry stopped the buyers from purchasing any more beans than they had to, as they were afraid they would be seized as hoarded food products.

Mistakes have been made and one of them was that we figured the whole of the crop held by the association would be moved in large blocks. Home trade was neglected and we later had to get busy and make connections all over the United States for the disposal of our crop. However, today we have the finest connections for the disposal of beans in the United States and are constantly receiving letters from our selling representatives that they would sooner deal through a growers' organization, because of the fact that they get what they buy and that the association is behind all they sell.

Had the Bean Growers Association dumped the whole of its holdings on the market at any one time during the last year, it would have spelled ruination to the bean market and we firmly believe that we would have seen beans selling at three to four cents. As it is, though we have been holding our members' crops, we feel sure that our members will receive a better average price for their beans than the independent grower.

The California Bean Growers Association has had a hard road to hoe since its inauguration, but a large proportion of our members are loyal to us and they all feel that we must at all costs make this organization one of the strongest in the state and we can do so if our members will give us their support.

Mr. Bean Grower, get behind this organization and make it one of the best and one of which you will be proud, when you can say to your neighbor, "Well, Bill, we have a bean association now that is some association. All I have to do is to turn in my beans and I am through worrying about them." This can and will be accomplished if each member will consider this association part of his business, which it really is. Do not forget that the California Bean Growers Association is your association and it is going to be what you make it.

The bean growing districts which are now organized are Michigan, Colorado, New Mexico and California. This only leaves New York unorganized (which is of importance in the production of beans).

The benefits that an association can be to its members are many. It has facilities of keeping touch with market and crop conditions all over the world and is in constant touch with the demand, can advise the grower the variety of beans that he should plant and can see that he gets the very choicest beans possible when it comes to planting time, so that he does not have to go to a seed house and pay exorbitant prices for seed beans. It can purchase sacks and twine and other necessary materials for his use. Think this matter over and write and give us your views on the subject. We are always open to receive suggestions from our members that will be a benefit to the organization.

NEW CHIEF

California has been honored in the appointment of Wm. B. Greeley chief forester to succeed Henry S. Graves, who is to retire May 1. The new forester has spent much of his life in California, graduating from the San Jose high school and the University of California. Greeley is the third to fill this office, the first having been Gifford Pinchot.

Mr. Greeley served as inspector of timber sales for the forest service in California from 1905 to 1906, and for the next two years as supervisor of Sequoia national forest. For six years he has been assistant forester with headquarters at Washington.

At the outbreak of the war he received a commission as lieutenant-colonel and had charge of American forestry work in France.

He was awarded the French Legion of Honor and the British D. S. O. for his work as chief of the forestry section of the American army in charge of 21,000 specially trained troops, whom he had helped to recruit, and 95 saw mills.

STEALING WALNUTS

A very profitable and novel industry has developed in Los Angeles County, as may be noted in the following:

"Fifteen thousand dollars worth of walnut meats were stolen from a warehouse at 106 East Avenue 20 last night by two burglars, who used a big truck to haul away their loot."

There were something over 250 sacks, 60 pounds to the sack, of these walnut meats.

GRAMM PIONEER BERNSTEIN

Ship by Truck

Two-ton Gramm Bernstein with 5-in-1 Combination Farm Body as used in sugar beet fields in Putnam County, Ohio

"Extras" are Standard on the Gramm-Bernstein

Gramm-Bernstein Worm-Drive Trucks carry, at the listed sale price, $500 to $550 worth of equipment, according to type and size.

This equipment is all essential to truck efficiency and economy. Any truck must have it.

On the Gramm-Bernstein it is listed as follows:—

Standard Gramm-Bernstein cab, with doors and storm curtains.

Exceptionally rugged metal ventilating wind shield.

Front fenders and steps.

Sturdy radiator guard, attached to frame independent of radiator.

Radiator shutter, operated from seat—facilitates starting, saves gasoline.

Boyce motometer, to indicate temperature of engine.

Army type towing hooks at front end.

Spring trailer drawbar at rear, on all capacities above 1½ ton.

Electric generator. Electric side lights with dimmers and non-glare lenses; dash light; bullseye tail light, protected in frame; electric horn.

Patented Gramm-Bernstein always-in-mesh transmission, with extension oil filler spout.

Patented dirt-proof wick oilers on all spring bolts.

Metal license brackets, front and rear.

100,000-mile hub odometer.

All Gramm-Bernstein Transmissions are trouble-proof and are provided with a pad for attaching Gramm's Basic Patent Power Take-off. Dealers and truck owners should assure themselves that any trucks purchased with power take-off do not infringe B. A. Gramm's Basic Patent No. 1194994

Ready for the Body— Not an Extra to Buy

Again Gramm-Bernstein is pioneering, in selling its trucks completely equipped.

This means that Gramm-Bernstein savings begin before the truck is put to work. They actually begin with the purchase of the chassis itself.

No one, we believe, appreciates better than farmers themselves the need of trucks on the farm, nor the time and money a good truck will save.

All truck buyers have always had to invest upwards of $500 in extras before they could put their machines to work.

Nothing of the sort with Gramm-Bernstein. It comes to you completely equipped—ready for the body—*not a single extra to buy.*

In this, as in the industry itself and most of its forward steps, B. A. Gramm has led the way.

Gramm-Bernstein records fairly bristle with figures that show these trucks *haul for less*, both in operation and upkeep; that they *last longer;* that they are actually *better built;* that they do require *far less* service and repairs.

Every farmer owes it to himself, before he buys a truck, to be sure he is making the best investment he can make.

On that score, we recommend the Gramm-Bernstein—most earnestly.

We sincerely believe that the Gramm-Bernstein far excels in downright, honest, dollar-value.

The nearest Gramm-Bernstein dealer will be glad to give you the benefit of his knowledge; or we will direct you to him if you will write us.

FARM LANDS FOR SALE

FOR SALE:
A HOME AND RANCH COMBINED.
An extremely well laid out plot of land 220 ft. by 454 ft. with full width city streets on three sides and an alley 30 ft. wide on the fourth, only eight blocks from Santa Barbara Post Office and business center. The land is first class sandy loam and will grow anything. There are 146 full bearing fruit trees, including apples, pears, peaches, nectraines, plums, apricots, oranges, lemons, figs, walnuts, loquats, avocados and berries: a good assortment of the best varieties and planted in perfect order. The place is planned for a first class chicken ranch and is fully equqipped for 10,000 to 12,000 head of fowls, including houses of the best construction and all modern, with cement floors, automatic drinking fountains, feed hoppers, brooders and houses, manure shed; feed house with alfalfa cutter motor driven, in fact everything in order for a first class farm. There is a well built house containing three bedrooms, livingroom, diningroom, kitchen and bath, (oak floors) for a home, and a two story, eight room house for working men. Garage for two cars. The fruit from the place will more than pay expenses. This property must be seen to be appreciated. It is offered at the low figure of $12,000 to settle up an estate. Come and see it, or write for fuller particulars and terms to F. H. Lingham, 10 West Anapamu Street, Santa Barbara, California. (Exclusive Agent.)

ARIZONA IRRIGATED LANDS
In 40 and 80 acre tracts at prices from $175.00 to $250.00 per acre, easy terms. Fertile bottom land under water and near Tucson, a thriving city of 27,000 population. Splendid local markets for all crops. Long staple cotton brings highest prices and sometimes pays for land in one season. No better alfalfa land anywhere and local demand always good at high prices. Grain, hay, sorghum, pink beans, corn and garden truck all produce bountifully and are in constant demand. Two crops per year usual. Splendid opening for dairymen. Raw milk brings 37½c per gallon. Climate very healthful and moderate owing to 2,500 feet elevation.
Write for booklet and let us tell you more about this land. TUCSON FARMS SALES CO., 511 Hollingsworth Bldg., Los Angeles, Calif.

Sulphur

It has been proven and ao recommended by the Univeralty of California that if you sulphur your grape vines and orchards 6 timea they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste Sulphurs.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 110 to 220 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100% pure. This has increased various crops up to 500%.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 degree BE., etc., Fungicides and Insecticides.

Carried in atock and mixed to order.

SAN FRANCISCO SULPHUR COMPANY
624 California Street, San Francisco, Cal.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET"; also booklet "NEW USES FOR SULPHUR," Price-list and Samples.

Please state for what purpoae you use the sulphur, quantity needed and date of shipment preferred.

The Velvet Bean

By Ernest Braunton

IN THE cotton belt of the Southern states no forage or cover crop has met with such favor as the velvet bean. It is an odd plant, differing in many ways from any other we grow but more closely related to the soy bean than any known to cultivation. It makes a growth each year that is little less than marvelous, the most vigorous of any cover crop. As a soil renovator for summer growth it has no equal and exceeds them all in tonnage of green feed or fertilizer.

While a little less adapted to general conditions in California, owing to our variety of soil and climatic conditions, in some sections it has retained all the glory it earlier gained in Florida. It is a hot weather plant and in midsummer makes its most vigorous growth. In the San Fernando Valley, near Los Angeles, and at other points, it has made a larger growth in a given period than any cover crop tried. While sometimes tender and caught by the first frosts it is claimed hardy varieties have been segregated that materially lengthen its growing season and extend its range. Its use is urged by those who have tried it as a quick soil cover to aid in overcoming the June drop of the orange, to yield humus and gather nitrogen.

According to the United States department of agriculture, the Velvet bean is the most vigorous growing annual legume cultivated in the United States and it is further stated that the acreage in the United States was increased from 1,000,000 acres in 1915 to more than 5,000,000 in 1917, principally in the Southern states; which will give an idea of the rapidly increasing favor which this crop has met.

The Best Variety

The Georgia, or Early Speckled Velvet bean, or in some sections known as the 100 Day Speckled Velvet bean, is probably the variety best adapted to Southern California soil and climatic conditions, and as it matures in 90 to 110 days it can be seen that its foliage would cover an orange grove in a short time. It has a great tendency to spread, sending runners out which are covered with heavy thick foliage.

Velvet beans surpass the cow pea in sandy soil and in heavier clay or adobe are as good producers. This particular crop can be planted in the early spring, as soon as the ground begins to warm up and after all danger of frost is over, and as the speckled variety is an early maturing legume it will produce a splendid foliage by the time the warmer period comes on. The system of planting is in hills about 18 inches apart at the rate of 15 to 20 pounds per acre when used in citrus orchards, which will give an ample growth to insure good moisture conservation.

Quoting from the government's experiment station report on the uses of the Velvet bean: "As an annual green manure crop it is unexcelled." The report goes on to state that when Velvet beans are planted without a supporting crop they produce such a dense growth of vines that in many cases noxious weeds and grasses are smothered. The Florida experiment station planted a recently plowed field of Bermuda grass to Velvet beans in 1898, and in 1899 this field was planted to cassavas, during which time it remained entirely free from Bermuda grass. And again in 1900 it was planted to a cultivated crop and no trace of Bermuda found. When Velvet beans are planted as a cover crop on new land they should be sown broadcast, but when on old grass land it is best to plant them in rows so that at least one cultivation may be given before the vines begin to run.

"In most instances where soil is cultivated to a large extent, there develops a hard under soil known as the heavy tap root is known to penetrate hard subsoil. When this root decays, it leaves an opening which will allow the moisture and air to get down into the deeper soil and thereby gives a greater productiveness.

"For cover crops the beans should be planted during April and May. This plow sole, which is detrimental in so far as the air and water will not penetrate to any satisfactory degree, and it is in this instance that the Velvet bean serves a splendid purpose, as will bring maturity during the late summer and early fall, when it should be turned under. Velvet beans should be planted in rows three feet apart, dropping two beans every 12 inches apart in the row. This will take from 20 to 25 pounds per acre. It will not do to sow broadcast on rich soils as they make too heavy a growth and interfere with irrigation. In plowing under, a chain should be attached to the plow at the end of which a weight should be attached, such as a horseshoe. The soil should be turned on this chain. The result will be that the chain and horseshoe will draw the growth under the soil, covering it completely."

Standardizing Figs

Cooperation is cooperating more and more. The fig growers are the latest. They met recently in Fresno and discussed cooperative programs in better growing methods, better standardizing and shipping methods and then in better market methods. After much discussion and even investigation into the present growing and packing methods, a committee of five consisting of Mayor W. F. Toomey of Fresno, as chairman, and F. W. Yoakum, I. J. Condit, Fred P. Roullard and J. M. Wrightsen was appointed with request to investigate and cooperate with the bureau of foods and the state department of agriculture, especially its standardization bureau, in growing, sorting and packing a higher grade standardized crop in 1920. The Fresno Republican reports:

"Following the appointment of the committee an informal conference was held and it was announced by the chairman, W. F. Toomey, that it had been arranged to send conservative samples of the figs grown in this locality, collected from different orchards and graded according to the beliefs of the growers, to Dr. E. J. Lea, director of the bureau of pure foods and drugs at Berkeley, for his analysis and report. The samples are to be separated and graded and sent to the state pure food expert in that form so that he may secure the grading as practiced by the growers and make report on the impurities found in the figs. This, it is believed, will do much toward standardizing the fig industry and eliminating controversy on the character of the California product."

Inasmuch as the losses are great, both to consumer and shipper in former methods, there is great interest in this new standardization movement. Mayor Toomey outlined the losses formerly incurred by the growers, stating that it amounted to five to seven per cent culls in White Adriatics, 20 to 35 per cent in Calimyrnas, while the ioss at the packing house, also shouldered by the grower, amounted to the same on Adriatics and from 12 to 15 per cent on Calimyrnas.

It was stated that it was almost impossible to determine whether a fig was a "cull" or not and that in some instances, especially that of smut, it was impossible to teli to what extent the fruit was injured until it was split open. This unstable situation in determining the percentage of good figs in the crops is stated by Toomey to be the cause for the lack of offers in advance on the San Joaquin Valley crop, while top prices are being offered for other fruits. The mayor outlined the federal tests which he had secured here a few years ago and told of the percentages which are allowed for impurities in imported packs, running to 34 per cent, although the exact basis of computing is unknown here.

Professor R. H. Taylor of the state department of agriculture outlined the status of his department in its relations to the growers of the state and offered cooperation with the bureau of

foods and the growers to assist in the work. He stated that the ultimate to be sought by any producer is the satisfaction of the consumer and that temporary loss will reap eventual gain in the fig industry.

THE CHERIMOYA

By Ernest Braunton

WHEN one sees three men in an orchard filling lug boxes with cherimoyas, or custard apples, which are shipped East and sold at an average price of more than one dollar each, it is time to ask if we have not "arrived" as a producer of strictly tropical fruits. For this is just what the writer saw a few days ago and what has taken place in this orchard for several years past. And the cherimoya is more tender than the avocado.

Typical Cherimoya—From Tree Producing Fruit Weighing Three and One-half Pounds.—Photo by Cultivator.

The trees, about 20 in number, are about 20 feet high, more than 20 feet through and about 20 years old. They have never been injured by frost, even in the cold snap of January, 1913. As is the case with nearly all tropical and subtropical fruits, they remain on the trees over a long period of ripening, so that from the first ripened fruit to the last, one may enjoy cherimoyas in the home orchard over several months. Fruits have been picked from the trees mentioned for the past three months and have varied in weight from a few ounces to a bouncer of three and one-fourth pounds, averaging about a pound and a half each.

Family History

The custard apples are typical of the order Annonaceae, to which they belong and have Annona for a family name. The species grown in California is the only one entitled to "cherimoya," but all are custard apples, a name which aptly fits the appearance and consistency of the flesh. The botanical name of our species is Annona Cherimola. Common names of other species are: soursop, custard apple, bullock's-heart, anona, sweet-sop, and negro-head. The latter is a purple fruit, and a reddish one is known as anona colorado, the latter name being Spanish for red. All those mentioned are more tropical in their requirements than the cherimoya and cannot well be grown anywhere in California. Ours is a native to the Andes of Peru, but others are from tropical Mexico, South and Central America. One mountain form. A. montana, is a large robust tree not yet known in California, but should be introduced as stock upon which to bud the cherimoya, as it is much the more vigorous of the two.

THE BLACKEYE BEAN

It is said rabbits will not eat the Blackeye bean and for that reason it has been somewhat a favorite with frontier planters, though not commanding as high a price as some other varieties. While they will produce well on any soil, a sandy loam is probably best. The yield is heavy, even without irrigation, but greatly increased with periodical waterings. As a field crop this bean has yielded as high as 2,500 pounds to the acre without irrigation, and is a good cover crop and soil improver. The best time for planting is generally the first half of April.

The present per capita consumption of the potato in America is less than three bushels, about one-third that of Europe. America has not kept step.

Instead of a seedless apple, we need one that is as big in the bottom of the box as at the top.

April 24, W. T. Dice and Harrold Waltz, Hanford.

E. D. Barry of Todos Santos Ranch, Daggett, writes that Ida Pontiac Korndyke, a junior two year old, has finished her 305 day test with about 517 pounds butter and 13,570 pounds milk. She will freshen again before the last of next month. Mr. Barry adds that Harry L. Redd has become herdsman of Todos Santos. Harry Redd was for several years with Higdon's big producers in Tulare County and under his care Mr. Barry expects a long bunch of his cows to freshen soon and make some long yearly records. A number of outside cows will also be brought to the ranch for test and breeding to the herd sire, Sir Aaggie Hiske Walker.

E. M. Walker, Lakeside, has sold his entire herd of Holsteins to Aitken Brothers, proprietors of the Meadow Lane Farm, Waukesha, Wisconsin. Included in the herd was the bull Terracelawn Hengerveld Segis, a son of the century sire Pierterje Hengerveld Segis and from a 32 pound daughter of Hengerveld De Kol, the first century sire. Terracelawn Hengerveld Segis has three century sires and three near century sires out of the seven nearest sires in his pedigre.

The two young daughters of King Korndyke Pontiac 20th, now in milk at Santa Anita Rancho, Santa Anita, have both increased the records reported in one of our recent issues. Anoakia King Korndyke, freshening at 17 months, made 15.40 pounds butter from 449 pounds milk in seven days, milking 65.8 pounds her best day. Anoakia Pontiac Beets 2nd, freshening at 20 months of age, made 18.27 pounds butter from 454.7 pounds milk, milking 68.9 pounds her best day. Both of these heifers are going right ahead with a big milk flow like real dairy cows.

Spring Farm Pauline Pontiac 2nd, owned by Bridgford Holstein Company, Patterson, is now on official test and already has over 35 pounds butter and over 775 pounds milk to her credit in seven days. She had a record at last freshening of over 33 pounds butter in seven days. Her son by the three times grand champion King Segis Alcartra Prilly will be sold in the Guaranty Sale at Sacramento on March 25, and besides his great breeding is an unusually high class individual.

King Segis Alcartra Abbekerk, senior herd sire in the Bridgford Holstein Company herd at Patterson, has another two year old now on test with above 24 pounds butter to her credit in seven days, and a senior two year old that promises to set a new high mark in her class in California. Rose De Kol Candee, a four year old in the same herd, has crossed the 30 pound mark and is still on test.

Emerson Mary Pontiac, a senior three year old, recently became the Kansas high record Holstein female of any age when she made on official test 33.46 pounds butter from 699.06 pounds milk in seven days. She is sired by Sir Piebe De Kol Segis Pontiac, son of the famous sire King Segis Pontiac Count, who is herd sire at Hillcrest Farms, S. E. Spires managing owner, Caruthers, California. This is the oldest daughter of this sire to freshen to date and is one of the heifers that Mr. Spires left in Kansas when he moved to California. Five good cows bred to this bull will be sold in the Tulare sale on May 6 by Hillcrest Farms.

Jane Garden Farm, owned by Fred W. Kiesel, Sacramento, has a number of good Holsteins on official test at present. One of the finest individuals in the herd now has above 27 pounds butter in seven days and promises to make further increase. She, together with several others of the very tops in the herd, will be sold in the Guaranty Sale at Sacramento on March 25.

C. W. Anderson, Burbank, will disperse his herd of registered Holsteins at his Edgemont Farm on June 17. According to C. L. Hughes, sale manager of California Breeders Sales and Pedigree Company, who will manage the sale, this is one of the very choicest herds of young Holsteins that has ever been sold in the state, both as to breeding and individuality.

Over 100 head of registered Holsteins have been listed by Southern California breeders for the big two day sale at Rhoades & Rhoades Sale Pavilion, Clearwater, on April 27 and 28. Besides the dispersal of the good herd owned by W. D. Millard, Arcadia, there will be high class consignments from Burr Farm, Agee Bros., P. H. Krick, W. T. McAlister, Bost & Johnstone, Chas. Harrington, Stalder Bros., and possibly others.

The sale of registered Holsteins at Bonita Stock Farm, Lodi, on April 20, will be rather a new feature in California Holstein sales, from the fact that there are no females of milking age in the sale. The offering will consist of 63 heifers from calves up to bred heifers, and 27 young bulls. A large percentage of the offering is sired by the 32 pound bull Supreme Glista Pietje, and more than half are out of dams with good official records. It promises to be an interesting event for the large number of buyers who have been making unsuccessful quests for registered Holstein heifers during the past several months.

A. R. Doctor at Van Nuys recently bought the young boar Belle's Hanford Boy from the John Bernstein herd in Kings County. At one year old this boar weighed 400 pounds, with the following measurements: 54 inch heart, 64 inch length, 33 inch height, and 10 inch bone. He is sired by President and out of Beautiful Belle. He and his get will be seen in the show rings next fall. Mr. Doctor recently secured one of the best brood sows sold in the McClune sale at Hanford, with prospective litter by Kings Massive Orange. The herd now embraces the blood lines of old Nelson, Jumbo, Expansion and old Glantess.

W. F. Sandercock, Berkshire breeder of Sacramento, writes that he has received word from W. Teasdale, Fallon, Nevada, who was recently elected a director of the Western Berkshire Congress, that he expects to show at the 1920 California state fair. Mr. Teasdale's herd is strong in the blood of the imported boar Epochal.

T. J. Gist and Sons of the Holberk Stock Farm near Tulare have just finished some official testing on some of their registered Holstein cattle. The heifer Gleesome Girl Mercedes of Holberk made 15.25 pounds of butter in seven days. Mooriand Hermana Jetze made 22.50 pounds as junior four year old. Holberk Cream Cup Scott made 17.50 pounds butter as a junior two year old. The latter is a daughter of their former herd sire, Cream Cup Pontiac Burke 3d. Another daughter made a 26.50 pound junior four year old record.

Toyon Farm Association announces the result of tuberculin test made on their Los Aitos herd last summer. The test was made under the supervision of the state veterinarian. One hundred and thirty-six head were subjected to the subcutaneous, intradermal and opthalmic tests. There were no reactors or any suspicious cases. Buyers at the coming Guaranty Sale at Sacramento will have a chance to buy some sterling individuals from a herd with this exceptional record. Toyon Model Hartog (bull), a great youngster by a son of a 31 pound two year old, out of a 23 pound junior two year old cow making a large yearly record, second dam a 31 pound cow that made over 30 pounds as a four year old and over 800 pounds in one year, third dam a 30 pound cow that made 1,129 pounds butter in one year. Others offered are Northfield Maid Ragapple, Stanislaus Princess Pontiac, Kakenstein Gerben, Cascade Mary Ormsby, Toyon Stanessa, Isabelle Ormsby Valdessa, Cascade Johanna, Laconner Pontiac Evangeline, Laconner Pontiac Albino Girl, Tritomia Bessie.

Numerically speaking, Donald Graham of Lancaster has one of the greatest Duroc litters of the season. His good sow Aneeda Rose recently farrowed 18 living pigs, four boars and 14 sows, the litter weighing over 50 pounds. She is raising 12 of them. They are sired by Orion's King Gano, the sire of many outstanding young things on the Graham ranch. A September boar by Great I Am is one of the classiest young prospects seen in a long time. The young females reserved for the sow sale some time this summer are a nice lot and will make an attractive offering.

Alex D. McCarty of Riverina Farms, Modesto, is constantly improving his herd of Poland Chinas. His most recent purchases include a September boar sired by Liberator and an April gilt by Big Square Jumbo 2nd. These were purchased at the recent Haag & Bernstein sale. They are both candidates for a place in the McCarty show herd for the coming season.

BURR FARM SALES

A letter from Burr Farm:

"Recent sales from Burr Farm registered Holsteins include a good three months old bull calf out of a granddaughter of King of the Pontiacs and sired by our Sir Veeman bull. He goes to J. F. Grueb of Huntington Beach to head his herd of grade cows. We sold Frank Reed Sanders of Phoenix, Arizona, one of the best bull calves that ever left our place. He is a son of Orndyke Duchess Korndyke, a 27.84 pound cow that milked 3,000 pounds of milk in 30 days, and the calf is sired by It. We have at our place two sisters of this calf from the same cow. One of them was junior champion at the Los Angeles Livestock Show. She calved at the fair grounds and 30 days afterwards made a record of 18 pounds butter in seven days as a yearling. The other sister has just calved with her second calf and is making a remarkable showing. We are going to put her on official test also. Mr. Sanders bought this calf to follow his herd bull, King Pearl Segis Pontiac, which is out of the same sire as J. J. Jeffries' great bull.

"Another sale that is of more than passing importance to the Holstein interests of Southern California is the purchase of eight cows from us by F F. Pellissier of Whittier. Mr. Pellissier purchased these cows as a foundation for a herd of registered Holsteins. All the cows are on semi-official yearly test and he is going to continue them, so that every cow he starts with will have a yearly record. Several of them have good seven day records now and they are a very fine lot of producers as well as being right individually. The cows purchased include Doremoon, with a 26 pound seven day record; Brudorin, a sister by the same sire, both being sisters to the 37 pound cow Boweda. The way the Doremoon cow is starting off this year she looks like a sure shot for

a 1,000 pound record. He also secured a fine granddaughter of King Segis. Mr. Pellissier is known as one of the best dairymen of Southern California and has always purchased the best of pure bred sires to put at the head of his grade herd, paying as high as $1,000 for them. His son just recently finished his university course at Davis and is taking active charge of the farm. We predict that before many years one of the finest herds of registered Holsteins will be on the Pellissier Ranch."

IMMUNITY TO HOG CHOLERA LASTING

A series of recent experiments on duration of immunity to hog cholera following simultaneous inoculation of young pigs supports the conclusion that the protection is lasting. The investigations were conducted at Ames, Iowa, by specialists of the United States department of agriculture.

Altogether 171 pigs, inoculated when a week to six weeks old and exposed to hog cholera, at times varying from five months to nine months and 26 days later, were found without exception to be immune to that disease.

Three of the pigs, however, died during the period of exposure from causes other than hog cholera.

There was no apparent ill effect from the simultaneous inoculation in any of the pigs.

There was no difference in the immunity of pigs from immune and non-immune sows.

Pigs that were approximately one week old received ten cubic centimeters of anti-hog cholera serum and one-half cubic centimeter of virus. Pigs that were three weeks old or more received from 15 to 20 cubic centimeters of serum and from one-half to three-fourths cubic centimeter of virus.

Immunity was tested by injecting five cubic centimeters of virus into the animals when they had attained weights exceeding, in many cases, 200 pounds. None of the hogs contracted cholera. The experiments appear to disprove assertions by some observers that simultaneous inoculation of young pigs is not lasting and that immunity disappears at stages of growth variously placed from weaning time up to 50 or 60 pounds in weight.

DO LICE ON HOGS INCREASE COST OF GAINS?

The secretary of the National Swine Growers Association was recently at the U. S. government experiment farm at Beltsville, Maryland, and saw the third bunch of hogs fed in the series of experiments to determine the difference in the cost of feeding lousy pigs as compard with those which are free from lice.

The work was begun in the fall of 1918, at which time two bunches of hogs were selected from some lousy hogs bought for the work. One of the bunches was given a thorough delousing treatment with crude oil and the other was untreated. Each lot of ten pigs averaging about 80 pounds was fed for 106 days on shelled corn and fishmeal in separate compartments of self-feeders. At the end of that time the lousy hogs showed 175 pounds less gain and the gains cost $1.00 per hundred more than did those in the louse-free lot. In this as in the second and third tests, the corn was valued at $1.75 per bushel and the fishmeal at $100.00 per ton.

In the second trial two lots with 12 pigs averaging about 100 pounds each were similarly fed and treated with the exception that they received middlings in addition to the other feeds although thy were fed for but 91 days.

At the end of the test the louse free hogs showed 192 pounds more gain than did those which were lousy. With the middlings valued at $50.00 per ton and the other feeds as given for the first test the louse free hogs produced each one-hundred pounds of gain for $1.50 iess than did the other lot.

In the last trial 15 pigs averaging 73 pounds each were fed for 89 days in each lot. The ration and treatment was the same as for the second trial. The louse free hogs made a total of 420 pounds more gain than did the others and their gains cost $2.94 less per hundred pounds than in the lot where the pigs were lousy.

In no one case in the three trials were the pigs unthrifty to a state of making very slow gains. The three lots of lousy pigs gained 1.23, 1.41, and 1.28 pounds daily per pig respectively. The corresponding gains for the other three lots were as follows: 1.40, 1.58, and 1.59 pounds per pig. In economy of gains a very good showing was made throughout the three trials. The cost per pound of gain in the three different lots of lousy hogs was as follows: 14.3c, 16.4c, and 15.2c. Corresponding to [illegible] the gains in the louse free [illegible] 13.3c, 14.9c, and 12.3c per pound gain.

It is very interesting to note that in the tests in which middlings was fed with the corn and fishmeal the lousy pigs on that ration ate more of the high protein feeds than did the pigs in the other lot. The reason for this is doubtless that the lice tended to drain the blood from the veins of the pigs and this had to be replaced. On account of the composition of the blood it naturally required a high protein ration for its replacement.

These three tests are doubtless the most complete of their kind which have ever been conducted. They indicate very clearly that one can well afford to take a little time and go to some expense to rid the hogs of lice if they are infested.

The department is contemplating going more thoroughly into this and other problems directly affecting the economic production of pork. Extensive work in the control and eradication of internal parasites will doubtless be included in the studies.

CLEANING MILKING MACHINE PARTS

One of the principal objections to the use of milking machines has been the difficulty in sterilizing the rubber parts so as to produce a milk of good quality and low bacterial count. Some of the milking machine companies have recommended simply washing and placing these parts in a brine or so-called steriiizing solution. While the inadequacy of this method has been widely recognized, there has been a lack of knowledge of a really satisfactory one.

Some dairymen have worked out methods for themselves which are apparently satisfactory. One of these parties is Miss Lucy Hicks of Santa Barbara, who has used a miiking machine for four or five years. She milks about 30 cows and has a high class trade, obtaining some three cents per quart more than her competitors. The average of her bacterial counts from wagon samples for the last nine months was 7,700 and among them was only one above 10,000.

After each milking she rinses the rubber parts in cold water, washes them with soap and water, using a brush, then places them in a vat of cold sterilized solution and turns in steam until a temperature of about 180 degrees is reached. They remain in this solution until the next milking. Under this method the long tubes last about a year, the short tubes six months and the teat cup rubbers three months

D. O. Brant of Elliott Brant Rancho near Los Angeles has developed a similar method. Mr. Brant milks 60 cows. He also has a high class trade, his miik being consumed largely in hospitals. His average count for the last four months from wagon samples was 6,000, the lowest being 700 and the highest 25,000.

He cleans the tubes with warm water, using a brush, places them in a sterilizing solution for a few minutes. He then places them in a ten gallon miik can, fills with cold water and turns in steam untii a temperature of about 160 degrees is reached. He ieaves them in this water until the next milking. The life of the long tubes is about four months, the short tubes two months and the inflations three months.

WORMS IN PIGS

The new crop of pigs will soon be getting to a stage where ciose attention should be paid to their physical condition. Dr. K. W. Stouder, veterinarian of the agricuitural etxension department of Iowa state college, strongly advocates the following formula for hogs infested with worms: Santonin, 5 grains; areca nut, 3 drams; calomel, 3 grains; sodium bicarbonate, 1 dram.

The above amounts constitute a dose for a 100 pound pig. Use twice as much for a 200 pound pig and two and one-half times as much for a 300 pound hog. Feed should be withheld for at least 18 hours before feeding above mixture. Repeat the dose in eight to ten days to make sure all worms are expelled. Where all the ingredients cannot be obtained, the following formula for a 100 pound pig may be substiuted: Santonin, 7 grains; calomei, 7 grains.

The average farmer has from eight to ten acres of crops per animal unit. By using silos and proper crops and cropping methods, a few farmers have reduced this to two and three acres per animal unit.

90 CHOICE HOLSTEIN YOUNGSTERS

At Public Auction

Bonita Stock Farm

Lodi, Cal.

Tuesday April 20, 1920

This is a complete dispersal of the young stock In this well known herd, and consists of

63 REGISTERED HOLSTEIN HEIFERS from calves up to bred heifers.

27 REGISTERED HOLSTEIN BULLS from young calves up to service age.

A large percentage of these are sired by the 32 pound buil Supreme Gilsta Pietje, and many are out of high record dams of excellent breeding.

This is as choice a lot of calves of unusually good type as has even been sold at auction in the state. Practically all of them are growthy, in excellent condition, well marked, and we consider this sale a rare opportunity for the buyer of young things.

"FEEDFINE" FEEDS

are scientifically compounded in proper proportions for dairy and all livestock feeding, of the following ingredients with the most economical results always in view.

YEAST — A concentrate high in PROTEIN and FAT content, sterilized and predigested.

CANE MOLASSES — The richest of feeds in carbohydrates—produces increased appetite on account of its palatableness. Its consumption results in increased energy and it is the best tonic known for animals.

ALFALFA MEAL — Gives body to the ration and supplies the mineral matter which is absolutely essential to all animals.

The greatest known combination for health, strength and productiveness.

REGISTERED HOG SALES A SPECIALTY

Some Factors in the Development of High Producing Cows

By C. V. Castle

THE success and reputation of the breeder of pure bred dairy cattle is based mainly on the records in milk and fat he can make with his cows. It is the ambition of every breeder to own a high producing cow, especially a class leader or near leader. Small breeders, especially those with moderate capital, are prone to become discouraged and to give up, saying that it is useless to try and compete with the man who has money to buy animals with fancy pedigrees at fancy prices. Such a point is not well taken. There are practically no strains or families in any of the leading dairy breeds from which it is not possible to develop high producing cows, and the poor man has almost equal oportunity with the man of means. This is not theory but has been demonstrated time and again, and almost every day a new record is made by a cow of so-called plain breeding, and quite often in the hands of dairymen of very modest means. It is the object of this article to state a few observations on the development of high producing cows.

The first thing to consider in starting out to develop a high producing cow is the material at hand to work with. First you want a heifer between two and three years old. She need not be a show heifer or one bred in the purple. She need not possess anything more to begin with than ordinary dairy type. What she must have, however, is a good strong constitution, as shown by large heart girth, good handling qualities, a bright eye and open nostrils. You want a heifer with a large open framework, and preferably free from any beefy tendency. The most important thing of all is her temperament and disposition. I would prefer a heifer a little highstrung and one with a kindly disposition. It is a hard grind for a cow to make a big record, and in order to do it a cow must possess a lot of grit and determination. She must be treated so as to develop a full response to the man who handles her, so that she will give every drop of milk possible—good feed or bad, hot weather or cold, sick or well. She need not have, to begin with, a very large barrel or an unusual development of the mammary system.

Starting with a heifer that answers the above description, the next thing to consider is how to develop her. She should be kept in a thrifty condition and be bred to calve when about 30 months old. She should be rather fat before freshening, as this excess fat will stimulate her to milk heavily.

The next thing to consider, after she freshens, is a method of feeding and milking that will develop her udder and add to her feeding capacity. It is possible to take heifers that look like a wasp after freshening and with six months time put a barrel on them that would do credit to many full aged cows.

The development of the barrel and increased feeding capacity is mainly a matter of proper feeding. Root crops such as mangels, carrots or sugar beets, or soaked beet pulp, I believe to be quite necessary. Feeding of grain and hay, even with silage, will not extend the abdomen as will roots or soaked beet pulp. The growth and expansion of the abdomen requires that the cow be properly nourished as well as fed bulky feeds, and to that end be liberal with the grain. The expansion of the abdomen is a matter of growth as well as stretching and in order to force the heifer to grow as well as give milk, feed a great deal more grain than would be done if economy of production were the only thing sought. To properly nourish the body and produce both milk and growth, feed a ration fairly well balanced, with a somewhat narrower nutritive ratio than would be used with a mature cow. There are some who think that a balanced ration is all right for an ordinary cow but that the test cow must have a very narrow ration. This practice may sometimes be held accountable for barrenness and other troubles encountered in high producing cows.

To develop the udder, milk veins, and persistency of the young cow, she should be milked at least three times a day. The natural tendency after a cow has been in milk for several months is to decrease rather rapidly in milk flow. To counteract this it is necessary to feed her heavily, much more than is really economical feeding, and it can be said that as long as the cow is thriving her grain should not be reduced even when her milk flow decreases. The next thing to do to keep up the milk flow is to milk more than twice a day. Generally, three times a day is often enough. The extra milking stimulates the udder, causes a growth of glandular tissue in the udder and an enlargement of the milk veins. It also stimulates the appetite of the cow. The milking must be well done. It is well to start in rather slowly at first until the cow lets down her milk and the blood begins to circulate in the teat, then milk rapidly in a businesslike manner, milking the two back teats or the two front teats first. When the milk is almost out, take plenty of time with the stripping. Strip the udder dry and then massage it for a few moments, then strip again. It sometimes helps some cows, especially small cows, to push in and up on one quarter while stripping the same teat with the other hand. If any of the quarters are light, and quite often the forequarters are, milk them first. In this way more milk is drawn through them and they are thereby stimulated and will become better developed.

The treatment of pure bred heifers in the manner outlined above will result in the development of many heifers into high producing cows that would, under ordinary treatment, be only average producers. This treatment will not only give the cow a larger record as an immature cow but will so develop her feeding capacity, mammary system and dairy instincts that she should, with proper treatment, make a large record as a mature cow.

Some may ask why it is not possible to wait until the cow is mature before feeding her so heavily and milking her three times a day. Of course, many cows are capable of making big records when handled that way, but a large number are not. It is necessary to grow and develop the capacity and mammary system while the cow is still immature and in a stage of growth and development.

One can hardly expect to take a cow that has been poorly treated as a heifer and succeed in giving her as large a record as a mature cow as can be made when the heifer has been accorded every opportunity for maximum development. Even a daughter of Tilly Alcartra and Carnation King Sylvia must needs be handled properly when young to develop maximum production.

While it is a fact that daughters of extremely high producers are seldom much better than daughters of cows with smaller production, the reason is largely attributable to the fact that the extreme production was not entirely inherited, but was in part due to development and environment. It is no doubt true that in a measure many high producing cows may transmit a part of this acquired productive ability to a son or daughter, but it is not to be expected that the dam can transmit more than she herself inherited.

It seems possible, however, that the continued forcing of a strain of cows to high production may in time tend to fix heavy milking qualities so as to result in more certain transmissi n of those qualities than is now the case.

SILAGE IS MOST ECONOMICAL

The Pennsylvania experiment station has found that two tons of silage and 200 pounds of linseed meal will carry a 1,?00 pound beef cow through the winter with some gain. This is more proof that silage is indispensable to the producer of beef. "Shortage of crops some years, due to drouth, cannot be helped," says R. W. Clark of the Colorado Agricultural College, "but on the whole the losses can be reduced to almost nothing. Silage will work wonders in preventing losses of all kinds."

MAINE JERSEY MAKES WORLD'S RECORD

Where is the man who said that an ordinary farmer under everyday working conditions cannot make a world's record with his cows?

Thrice within a year this theory has been contradicted by Jersey cows in working farmers hands. First by Vive La France, an Oregon farmer's cow, which made the four year old and breed record of 1,031 pounds fat; then by Lulu Alphea of Ashburn, a yearling, which made 800 pounds fat for her owner who only two years before had graduated from grades to pure breds.

The third and latest case is that of Plain Mary, a registered Jersey that found her way into the barn of two farmers who had decided to try their luck with pure breds. Their cow has made 15,255 pounds milk and 1,040 pounds butterfat in one year and gained the title of World's Champion Jersey. She is now owned by F. W. Ayer of Bangor, Maine, who bought her at a fancy price from Kelly and Cossar of Winn, Maine, the men who owned the cow until the sixth month of her present test. She was sold on condition that she remain at the old home farm to finish her record, and she will now be sent to her new home in Bangor.

Mary started her test at eight years and eleven months of age, and during the first six months she averaged more than 100 pounds of butterfat per month. From then on she had a few reverses and did not make as large a record as was expected.

The country in which she lived is subject to severe extremes of weather and the setbacks were due to a weather variation of 84 degrees in one day in June and then in December she was subjected to 45 degrees below zero in an unheated barn. The farm is located in an unprotected spot on the shores of the Penobscot River, and Mary had the benefit of all the fresh air that blew across fields of ice and snow. In spite of her handicaps she finished strong and averaged 28 pounds of milk a day during the last month of her record.

Plain Mary's record is more of a tribute to official test work than it is to breeding, as she does not belong to any particular strain. She reverts to St. Lambert blood chiefly, but no plan of breeding is brought out in her pedigree. As an individual she is much better looking than her picture. Cattle experts who have seen her say she is an almost perfect specimen of the producing dairy cow. She has plenty of barrel, strong constitution, good udder and teats, a very fine hide and every evidence of "dairy temperament," or willingness to work.

Where the Jersey World's Record Was Made

Plain Mary is the cow nearest wall on left shown by X. Joe Cossar is the man who fed and milked her.

Plain Mary occupies one of the two box stalls built for Register of Merit cows in Kelly and Cossar's barn. There is a total of 51 animals in the barn, five of which are on Register of Merit test. All the work is attended to by Joe Cossar and his assistant, Frank Baker.

Plain Mary was milked three times a day. Mr. Cossar did the night and morning milkings, while Frank Baker did the noon milking. Had she been milked four times a day, as some animals are milked on large farms, she undoubtedly would have done even better.

Plain Mary's record was very closely supervised. There were 22 supervisions by official testers (each of whom stayed two days). They represented five state agriculturai colieges and each one was a recognized expert in this line of work.

A notabie feature of this record, and of the other two mentioned in the first part of this article, is that all these animals carried calves during the greater part of their records, and Plain Mary is due to calve and qualify for Class AA Register of Merit, which means a calf with each record. Plain Mary has two other official records to her credit, one of 514 pounds fat and the other 828 pounds fat. She has also had six recorded calves and therefore is a great reproducer as well as a maker of large milk and butterfat records.

The figures given here show how Mary piled up her total of 1,040 pounds of fat by months.

1919	Milk, ibs.	Fat, lbs.
Februay 28	42.5	2.75

LARGE COWS EXCEL IN YIELD

Cow testing records based on 38,532 dairy cows from 110 cow testing associations are being analyzed by specialists of the dairy division, United States department of agriculture. The tabulations have brought out a number of interesting relations between milk production, butterfat test, butterfat production, and income over cost of feed. The larger cows excelled the medium and small cows in production of both milk and butterfat.

The average annual milk production of all the animals was 5.936 pounds per cow, and the average butterfat prodnction 246 pounds. These figures are considerably larger than the average for the United States, indicating that dairymen who are members of cow testing associations either dispose of their poorest cows or else make them more profitable by better feeding and handling.

GUERNSEYS AVERAGE $546

According to published reports in the Guernsey Breeders Journal 29 Guernsey sales were held during the calendar year 1919. A total of 1,309 Guernseys sold for $715,748, or an average of $546. Two hundred thirteen bulls averaged $470 and 1,096 cows averaged $561.

SENIOR SIRE

Sir Pietertje Ormsby Mercedes 43rd

a son of

Aaggie Wayne Peep

with

A record unequaiied by any cow of any breed—4992 Butter, 110,000 lbs. of Milk in 5 years, covering her entire life. Her transmitting ability is demonstrated by her two daughters, both full sisters to 43d. These heifers have both above 26 lbs. and year's records of 800 lbs. Butter and over 18,000 lbs. of Milk.

SIR PIETERTJE ORMSBY MERCEDES 43d is by a sire with more thousand-lb. daughters than any other buli.

For Cows Only

KOW-KURE

Stop Losing Calves

Abortion is unnatural, and denotes a run-down condition of the genital organs. Strengthen these organs and they will resist the ravages of the Abortion germ.

KOW-KURE is a medicine that acts directly on the genital and digestive organs, giving them the vigor of perfect health. Cows treated with KOW-KURE before calving do not abort. You save both the calf and the cow's health by using the KOW-KURE preventive treatment.

KOW-KURE is also invaluable in the prevention and treatment of Retained Afterbirth, Barrenness, Bunches, Scours and Milk Fever. Sold by feed dealers and druggists; 60c and $1.20. Write for free book, "The Home Cow Doctor."

Dairy Association Co., Lyndonville, Vt.

To Prevent or Treat ABORTION

BICKMORE'S

YOU LOSE MONEY every time you lay your horses up for sores. Use Bickmore's Gall Cure—cure them while they work! Money back if it fails. At all dealers, 35c, 70c, and $1.40. Also ask for Bickmore's Horse Liniment.

For yourself, always keep handy Bickmore's XYZ Skin Ointment and Bickmore's XYZ Family Liniment. Ask your dealer for them.

GALL CURE

GUERNSEYS

$546 Was the Average Price paid for all Guernseys sold at public auction in 1919. This figure indicates the buyers' high estimation of the value of the breed. Let us tell you WHY Guernseys lead in popular favor.

When an Optimist Turns Pessimist

By Geo. W. Fry, The Redwoods Ayrshire Farm

I AM not usually a pessimist, in fact, I always encourage myself to lean the other way, but the present tendency of the dairy industry is apt to strike a note of pessimism in the heart of anyone. The dairyman is in between two millstones; the one is the ever upward cost of production and the other the always downward bearing selling price of products. This mill is grinding exceedingly fine and promises to grind finer before the present season is over.

As I write this we are having a life-saving rain, but whether or not it will be sufficient to make up for the deficiency of the past months and also store up enough moisture for spring and summer remains to be seen. It will make the crops and pastures grow but it is a question in my mind if it will be enough to assure a long pasture season. If it rains all through March with showers in April we may expect a fair season. Otherwise (and here is where the pessimism enters), the dairyman must buy roughages and grains which promise to be exceedingly high. Many are in debt now for feed used in the last few months and they do not feel cheerful about buying more feed before that debt is paid. Most reserve stocks of hay and grain have been used up. Local alfalfa has been consumed and large supplies of Nevada grown hay brought in at a high cost. This means that even though we get enough rains to insure the usual number of cuttings this year that the price will be high as farmers' barns and the warehouses are empty. The farmers will fill their barns to guard against another such season and the warehouse owners will stock up for speculative purposes.

The grain and mill feed markets do not seem to be any more promising. It is going to cost more to produce grain crops this year; the millers will have to pay more and they in turn will charge more for the flour and the bran and other byproducts. Cocoanut meal is scarce; we are told that the labor problem is acute in the lands where the raw product is produced. Ships are more or less scarce and are asking a high freight rate. The main item of cost in all these things is the high price of labor and that is not going to change—unless it be upward.

The United States department of Agriculture recently completed a survey in New York which showed that the movement of farm owners and hired help cityward is greater now than it was during the first few months of the war. Their investigation leads to the statement that farm labor will receive 14 per cent more this year than in 1919, which in turn was 80 per cent higher than at the outset of the war. This will, of course, be reflected in the wages to be paid here on the coast.

On the other hand consumers are demanding that the price of milk and cream and butter be reduced and in their ignorance are taking up the unfair method of boycotting these products. They lose by this but don't know it. Price investigating committees are now at work and more will spring up here and there, but these bodies work so slowly that the dairy industry could be extinguished while awaiting their report. These committees are not efficient as a rule and their findings are inaccurate and unreliable. A New York commission recently rendered a report that was very near Bolshevism. They proposed to put the farmer, cows and all under a board of three politicians with absolute authority to say what should be produced and how disposed of—thoroughly unpractical as you can't make a horse drink even if you tie him to the trough all day.

The American dairyman is beginning to feel the depressing effect of foreign competition. About 560,000 pounds of Danish butter arrived last month and a larger shipment is due during March. The Danes are now contracting butter for future delivery at 50 cents per pound. The government says that if our price goes much higher Argentine will turn her surplus stocks this way. All this may mean lower prices for the consumer—at least as long as the Americans try to meet the competition—but if the game is too hard the American will quit and then Mr. Consumer will know what high prices really are.

I have no remedy to offer. Personally, I am not going out of the dairy business but am going to hang on until the last dog is hung. There are others, however, who can't or won't do this. Some of them are beginning to get out now. Reports came in yesterday of an old established concern in the Santa Clara Valley changing hands. That man is going to take his $50,000 and put it where it will earn a better rate of interest with less work on his part. Others are going to butcher their herds and go to work. Milkers can get from $100 to $150 per month and board and that is more than some dairy owners clear.

The consumer must wake up. He makes the mistake of his life if he lets the California dairy industry go under. Shortened production means nothing but increased price and if the process of elimination goes too far there won't even be milk for those that can pay the price.

We must have a price that will allow us a fair margin of profit. We must surround our families with the same degree of comfort and convenience that our money and labor would permit if invested in some other line of endeavor. We, and by that we mean dairymen generally, are not going to maintain our investment of five or ten or 15 thousand dollars in cows, land and a plant and then work ten to 15 hours per day seven days in the week for what is really less than the interest our money would bring if put into government bonds.

BILLS OF SALE FOR CATTLE

Apparently considerable misunderstanding exists regarding the requirements of the act of May 28, 1917, with reference to bills of sale. Section five of the act provides in part as follows:

"Upon the sale or transfer of any cattle in this state, the actual delivery of such animal shall be accompanied by a written bill of sale, giving the number, kind and marks and brands of each animal, which bill of sale shall be signed by the party giving the same," etc.

This particular provision of the law is not a new one in this state and did not first become a legal requirement at the time of the passage of the present hide and brand law. Section 3182 of the political code of California, enacted March 12, 1872, makes the following regulations for selling cattle, etc.:

"Persons selling cattle, horses, mules, jacks or jennets must counterbrand them on the shoulder, or give a written descriptive bill of sale."

This section of the code, which has never been repealed, provides that a person selling cattle, etc., must do one of two things—either vent his cattle at time of sale, or give a written bill of sale. This act of May 28, 1917, simply defines the kind of a bill of sale that shall be given. The old law of 1872 requiring that all cattle be vented or a bill of sale given at time of transfer, became inoperative and was not complied with generally by cattlemen and others, due to the fact that no particular officer was charged with its enforcement.

Cattlemen should at all times insist that a buyer take a bill of sale whenever the ownership in cattle is transferred. This is a reasonable legal and business requirement and protects both buyer and seller. Aside from this, a bill of sale properly executed is the only evidence of ownership of cattle that can be offered and accepted by inspectors employed by the department of agriculture for the office of cattle protection when such inspectors are inspecting cattle for marks and brands. The evidence of ownership and the legal right of parties in the possession of any cattle or to ship or slaughter the same, can only be verified by these bills of sale, which must be shown before the inspectors can permit the cattle to be shipped or slaughtered. As an example, John Brown, a cattle buyer or slaughterer, has in his possession two head of cattle. These are branded with the letter "S." Before Mr. Brown can ship or slaughter these cattle they must first be inspected and his rights to the ownership of the cattle verified. If the records show that the cattle branded "S" are the property of John Smith, Mr. Brown must be able to produce a bill of sale from John Smith showing that he has purchased the cattle, before the inspector can be satisfied as to Mr. Brown's legal right of possession and ownership of the cattle. The owner is thus fully protected by virtue of the bill of sale, which should be in the possession of the buyer at all times. A buyer of cattle should for his protection refuse to purchase cattle from anyone who declines to give him a bill of sale. When a person is unwilling to comply with the simple legal and business provision of the law, which insists that a bill of sale be given when cattle are transferred, a questioon arises as to the seller's rights of ownership in the cattle, as no one legally in possession of any cattle can reasonably refuse to give a purchaser legal evidence of ownership.

GRADUAL DECREASE IN FARM HORSES

Horses in this country reached their maximum in 1918 and since then have been gradually decreasing, according to data compiled by the bureau of crop estimates. While this statement applies to the United States as a whole, the information secured by the bureau relates primarily to the supply of horses on farms and ranches, the gradual decrease of which is attributed to motor vehicles. That the decline of the horse on farms is not due merely to the use of passenger automobiles is indicated by a survey recently undertaken by approximately 36,000 crop reporters representing the bureau in all sections of the country. They have reported the names of more than 49,000 farmers who use motor trucks on their farms. But the extent to which these trucks displace horses is problematical. In many cases the introduction of a truck on a farm indicates provision for increased hauling rather than an actual reduction in the number of horses used.

The estimated number of horses on farms and ranches January 1 of this year was 21,109,000, a decrease of 373,000 head, or 1.7 per cent, compared with a year ago. The total value of these animals this year is estimated at $1,992,542,000, as against

Ye Olden Time Farm Auction at Tipton, Tulare County, Calif.

On Tuesday, the 23rd day of March Free barbecue lunch at noon. No catalogues issued but all stock, pure blood and registered or eligible to record. Registration papers furnished free. Selections of choice individuals out of a herd of 140 head, Oxbone, Poland Chinas, the massive smooth hogs, boars, bred sows and open gilts, sired by the great boar Wondergerst No. 317713. He was sired by Big Jones, by Gerstdale Jones of a Big Bob Wonder Dam. Great breeding, a great individual and a great sire.

There is everywhere a shortage in Brood sows. Here is a great opportunity to get them at your own price and pure blood.

Owners, F. E. Fay and Dr. F. E. Hull.

Sale on Dr. Hull's ranch, 2 miles southwest of Tipton, Tulare County, Calif., March 23rd, 1920, 12 o'clock.

$2,114,897,000 last year. This means an average value per head for horses of all ages of $94.39, compared with $98.45 a year ago. The average value per head ten years ago was $108.03. From these figures it is not difficult to understand why the horse market is regarded as unsettled and the future equally uncertain. The best demand during the past year has been in the South, while decreases have occurred on the western ranges. During the past two years the increased demand for feed for high priced meat animals has made it relatively more costly to keep a horse on the farm.

PRODUCTION RECORDS NECESSARY IN DAIRY MANAGEMENT

Notwithstanding the fact that one occasionally hears the argument that high producing cows are unprofitable because of their more exacting requirements as to feed and care over cows of lower production there is ample evidence, says A. E. Perkins of the Ohio experiment station, to prove that almost invariably, aside from extreme forced feeding, cows producing large amounts of milk or fat produce unit quantities of these substances more economically than their mates who eat less and produce less.

Cows of the same body weight require approximately the same amount of food to maintain their weight and bodily activities regardless of their productive ability. The conclusion has been quite generally accepted in recent years that it is the ability to consume and make proper use of food beyond this maintenance requirement that determines a cow's value for dairy purposes. The man who ignores this weight of evidence and by preference or neglect retains low producing cows will be badly handicapped if he depends on dairying for a livelihood.

Many seem to consider that one testing of a cow's milk by the Babcock method without even so much as a reference to the amount of milk produced will determnie once for all the cow's status as a producer. It should at all times be remembered in interpreting results secured with the Babcock test that the total amount of fat produced is of far more importance than the percentage of fat. The fat production is ascertained by multiplying the weight of milk produced by the per cent of fat it contains as found by the Babcock test. It will thus be apparent that accurate figures regarding the milk production are fully as important as the test in determining fat production. The cow producing the highest testing milk is not always the most economical producer of fat. A cow producing 40 pounds of three per cent milk is producing just as much fat as the cow whose milk tests six per cent, but which produces only 20 pounds per day; and far more than one testing eight per cent which produces only ten or 12 pounds of milk. Rough estimates of the quantity of milk produced and an unaided memory as a means of recording it are thoroughly unreliable and unsatisfactory. Likewise estimates of the richness of the milk based on its color or the readiness with which it forms a cream layer are not to be depended upon. Dependance on any such measures is quite liable to lead to condemning the wrong cow.

As is well known, marked variations in both quantity and quality of a cow's milk occur from time to time. The most important cause of these variations is the advance of the milking period, although other causes, such as changes in quantity and quality of food, changes of weather and nervous excitement of any kind may exert a great influence in this respect. For the reasons just stated, weighing and testing a single milking or the milk of a single day can give no very reliable idea of a cow's productive ability, even though the weighing and testing be done with the utmost accuracy. The average of several of these daily weighings and tests, taken at approximately regular intervals, gives good results and when the work is done as often as once a month the results come surprisingly close to those secured by more elaborate systems.

Besides their value in locating low producers, production records are well worth their cost for other purposes. Too many dairymen feed all cows alike regardless of production, or at most give only a small extra allowance to the heavy producer without any special thought in the matter, not realizing that a good cow in the early part of her milking period may need two or three times as much digestible food material as the small producer standing beside her or as she herself would need for her diminished milk production near the end of the milking period. The extra feed needed to bring the ration of the heavy producer up to the amount called for in one of the recognized feeding standards will usually pay far better dividends than any other feed used on the farm; and failure to supply it is a real extravagance. On the other hand, the heavy feeding of cows which lack milking capacity can result only in waste of feed. A definite determination of the production at approximately regular intervals, and adjustment of the amount of grain fed according to the amount of production, would doubtless result in a vast saving of feed and a considerable increase of milk production on most farms where some such program is not already in effect.

Many who are convinced of the desirability of production records fail to keep them because, in the press of other duties time does not seem available. The time actually required with simple equipment under ordinary working conditions to weigh and record the milk production and to remove the sample for testing was found by the writer to average 23 seconds. This would mean less than two hours' time per year in a herd of ten cows, where the work was done one day each month. The testing of each sample in duplicate for butter fat and the care of the samples and glassware was found to require an average of six minutes' time by an experienced man using a power driven tester. A less experienced man using less convenient equipment would perhaps require twice as much time to do this work. Three hours per cow per year would thus seem to be a liberal estimate of the time requirement for making a reasonably accurate production record. The work of taking samples and testing, although it should be done at approximately regular intervals, could be planned or set aside to dodge especially busy seasons and done on a day when the weather makes field work impracticable. The records could be worked up in permanent form at times when other work was not pressing.

Simple equipment for weighing, sampling and testing milk is illustrated and described in the publications already referred to. This is procurable for a very modest expenditure. Blanks suitable for keeping records may easily be prepared by the dairyman himself, or may be purchased from firms dealing in dairy and creamery supplies. Proper blanks and record books, bringing the records together in permanent form, are an essential part of the system; for scattered records which are not totaled and put on a yearly basis are of little value and are likely to result in disappointment and the abandonment of the entire scheme.

CARE OF COW AFTER CALVING

After a cow has calved she should not be bothered by any other animals or persons, but should be kept as quiet as possible and left alone, is the advice offered by Dr. G. H. Conn of the Iowa experiment station. The quarters should be comfortable and should be as clean as possible and her body should be kept as clean as possible. The afterbirth should be removed, and the blood that has soiled the tail and thighs should be removed by washings. In the summer time if the afterbirth is allowed to remain where the cow is stabled or the soiled bedding is allowed to remain it greatly attracts flies.

She should have plenty of good nutritious food and fresh drinking water. If it is in the summer season, grass makes a very good feed for cows.

The cow frequently resents the approach of other animals and also of man and will frequently injure her young by trampling upon them. This is especially noticed in cows that are in the field during the greater part of the time. Especially is it dangerous for strangers to approach some cows under this condition.

Occasionally young cows refuse to allow the calf to suck and will have nothing at all to do with it. We observed a strange incident with one heifer with her first calf. After it was delivered she bellowed fearfully and backed off in one corner of the stall and placed her head to the floor and would make feints as if to butt it and did so two or three times, but not hard enough to injure it. We advised leaving her absolutely to herself for awhile, which was done. She mothered the calf in fine shape. If this repulsion is not too strong it can often be overcome by handling the cow carefully and holding her and permitting the calf to suck a few times per day. Sometimes this may be brought about by annoyance of the attendants.

Where there are several young calves it not infrequently happens that some of them will suck some of the other cows, thus stealing the feed from the calf that belongs to the cow. Another difficulty that may be experienced is the interchange of young, especially if several of them are calved at about the same time and are running loose in an enclosure. In some instances calves have been stolen from one cow by another.

A good plan to follow with the cow when she has calved all right and is comfortable is to permit as little interference as possible to the carrying out of her maternal instinct.

ARIZONA FEEDING TESTS

Some feed tests are being conducted at the Salt River Valley experiment station under the direction of Dr. R. H. Williams. Thirty-six steers were used in the test, divided into six lots of six steers each. They were fed eight weeks.

One lot was fed on alfalfa and sorghum silage; one on sorghum silage and three pounds cottonseed meal; one on alfalfa hay forage; one on three pounds cottonseed meal, silage and alfalfa hay; one on silage, three pounds cottonseed meal and six pounds ground threshed milo; one on silage, alfalfa hay, three pounds cottonseed meal and six pounds of ground milo.

The best results seemed to be from the lot fed silage, three pounds cottonseed meal and alfalfa hay. This lot made an average gain of 3.10 pounds per day.

Cattle ranges in the northeastern part of Arizona are reported to be green and stock making splendid improvement. The snow is disappearing from the high elevations. Weeds and grass in other parts of the state are good and stock is reported to be in fine condition. Steers are being sold for the May delivery.

DUROC BOARS FOR SALE

We were raising these two Colonel Boars to use with our Phenomenal Herd Boar, PATHFINDER WONDER. We have purchased another splendid Pathfinder boar, however, so will have no use for the Colonels. These Colonel boars were sired by Derryfield Colonel, Dam, Fair Lulu 3d. Farrowed July 15, 1919.

They are both exceptionally fine boars; have been well raised and will make real herd boars. If you want Colonel breeding you can make no mistake in purchasing either one. Prices reasonable considering quality of stock.

Insure the Dairy against Udder Troubles

Do all of your cows have soft, pliable udders and clean, easy-milking teats? If not, you are passing up valuable milk-income which you might just as well have.

The big dairymen—the successful cow-owners—know that the cow's milk-making organ must be healthy inside and out, or an immediate milk loss is inevitable.

Bag Balm is the "little guardian of the udder"—a soothing, healing ointment in a liberal package, just right for stable use. Its penetrating quality reaches promptly and relieves any internal congestion or inflammation. Caked Bag, Cow Pox, Bunches, Chapping—any irritated or abnormal condition of the tissues is almost instantly reduced by application of Bag Balm. Makes the udder surface and teats clean, smooth and easy to milk.

Bag Balm is a great healer, too, for all scratches, cuts, chaps, sores and bruises. It should be on hand in every cow stable. Write for our useful booklet, "Dairy Wrinkles"—sent free.

BAG BALM
MADE BY THE KOW-KURE PEOPLE

Selection and Use of Range Bulls

From Address by Charles U. Pickrell Before Arizona Cattle Growers Association

INCREASED expenses of the business make a higher return per cow necessary. In days gone by ranges cost practically nothing, overhead expenses were not so heavy, and in a struggle for new range area a grower was more concerned with numbers than with quality. Today, whether a cow grazes on the forest, on leased or on patented land, she must be charged with a feed bill. This, with the increased cost of labor and improvements, leaves the cattle industry working on a closer margin than ever before. It is evident that if a man desires to remain in the business he must receive a higher return from every cow. The scrub cow cannot meet this demand, so, added to list of problems confronting the cattle grower is one of no little importance, that of herd improvement.

It would not be practical for various reasons to sell off an entire range herd and replace it with pure bred stock. Improvement must come through the use of good bulls. You probably have heard it before, but allow me to repeat it again—that a bull is half of the herd, and he can be even more than that. Think of the bulls you are using as controlling more than one-half of the value of your calf crop.

The first evidence of benefits from the use of good bulls is found when yearling steers are marketed. The average scrub yearling will do well to weigh 300 pounds, while a good grade of the same age will weigh 425 pounds and will sell for at least two cents a pound more. The average two year old scrubs will weigh about 525 pounds. Average two year old grades of the same age weigh about 725 pounds, and here we find at least three cents a pound difference in price.

Right here it might be well to mention a few points that determine the value of a beef animal. Though we do not fatten many cattle in this state, and though of late years a very small percentage of the steers are kept after they reach the yearling stage, our cattle must meet the demands of the butchers, whether they are put on the market from the growing ranges of the Northwest or from the feed lots of the Cornbelt.

The butcher desires an animal having: a high dressing percentage, that is, a carcass that will contain the largest possible amount of the live weight; the largest possible amount of the weight of the carcass carried on the loin, the rib and the round. These three cuts contain a little more than half the weight of the carcass but bring over three-quarters of the selling price of the beef.

The best grade of carcasses are classed as block or side beef, that is, beef that can be sold over the block for retail trade. A carcass for this purpose must be thick, have plenty of width for its length, and have fat well intermixed with the lean. The next class is the cutter class. Carcasses of this class contain rounds and loins that are thick enough for block trade, and the remainder is sold as boneless or cured beef at a much reduced price. Last, we have the canner class; here we find carcasses no part of which is fit for block trade.

Nearly without exception, an animal with a high dressing percentage yields a carcass fit for the block.

The feeder must meet all the demands of the butcher and also have an animal that will make the largest amount of gain on the least possible feed in the shortest possible time. The grower must meet the demands of the feeder, which of course are those of the butcher, too. And here in Arizona it is necessary to breed animals that will meet these demands and also do well under range conditions.

I have already mentioned, the requirements of a beef animal.

Now I think it would be well to go a little further and speak of the exterior appearance of a bull to sire this type of an animal.

A beef animal must have plenty of depth, close to the ground; flanks low, broad, and smoothly covered with a thick covering of firm flesh. While a butcher would rather have a small percentage of bone, a small boned animal does not put on the weight or fatten as readily. The head of a breeding animal is by no means to be overlooked. On a beef bull we want to find a short, broad head, one denoting character. A strong, masculine head on a male or a refined feminine head on a female are the best indications of strong sex development, and we are very apt to find it an indication of offspring. Take, for example, the head of a steer; it ceases to become masculine when the animal is desexed, and a barren cow has a head much like that of a steer in appearance.

Well bred bulls sometimes are of little use on a range because of having poor feet. A bull is not different from a horse in this respect. A saddle horse grown to maturity on soft ground is of little use in the rocks. It is the same with a bull; to move about in rough country he must possess large feet with thick walls and soles. Where do we find the bull with sore feet? Down on the creek beds and flats while the cows are grazing on the highest parts of the range.

Size, also, is of great importance. We can even approach roughness to obtain size.

Why is a registered bull the best? Because you have a greater assurance that your bull will breed truer to his type. It is foolish to buy just a pedigree alone. We all know that even pure bred herds produce a certain percentage of animals that are not good. But of two good bulls, one registered and the other unregistered, the registered animal is by far the best, even at a considerable difference in price.

The registered bull has the "pull of ancestry" behind him; his ancestors have been selected for generations. Selection does not make perfect, but it tends to do so, and the more generations we have under selection the greater the possibilities for an animal to produce like offspring.

A bull should be brought under the conditions where he is to be used at as early an age as possible, in order to become acclimated and grow used to conditions before his services as a sire are needed. Especially is this true with reference to the development of the feet of an animal. A young animal can grow feet for the rocks, but an old one cannot do it.

It is not uncommon to hear cattlemen remark, "I brought my bulls in last year from such and such a place, and this year I haven't but a few calves." A change in climatic conditions can easily render a bull worthless as a breeder for several months. Buy yearling calves and place them on the range in a separate pasture, if possible. If not, turn them on the range with other cattle, but have enough other bulls of breeding age so as not to count upon the yearlings at all. Breeding yearling bulls stunts their growth, and a small calf crop results. Conditions cause a variation as to the number of bulls to the number of cows. I have yet to find a man who said that he had too many bulls. Successful cattlemen tell us that at least eight bulls to 100 cows are necessary on mountain ranges, and five to 100 on ranges located in smooth country.

The period of usefulness as a sire varies somewhat with the individual, but the average is about five years of service. That is, bulls commence to be useful at two years and are useful as sires until the age of seven or eight.

Much of the effort in securing good bulls is wasted if they are left to rustle the year around. I do not mean by that bulls are more apt to starve to death, but a thin bull will spend his time rustling feed instead of looking after the cows. As a result, all cows are not served at the best time. A bull that has been well fed will serve more cows and do it in a shorter period; he will hunt the cows up and be more vigorous. Young bulls will grow larger and losses will be less. A little straw or silage and two pounds of cottonseed meal for 60 days will do wonders for a bull. Bulls of the grade we need are too valuable to be starved.

Feed can put fat on an animal, but breeding must make the form and put on the lean meet. The man who produces well bred steers sells to the same buyer every year, many times

by correspondence, and receives the highest prices. The user of good bulls need never be afraid to sell by weight; and where is the producer of scrubs when cattle are sold by weight?

BEEF CATTLE PROGRESS AND OPPORTUNITIES IN CALIFORNIA

By H. M. Barngrover, Vice-President Pacific Coast Hereford Breeders Association, In American Hereford Journal

The discouraging conditions of the past placed beef bulls at a low standard, and the pioneer breeder had poor encouragement. Some large herds went out of business or failed to keep up records on the cattle, and many entirely lost sight of the corncrib cross, much to the detriment of the beef breeds.

These conditions resulted in the shipment of inferior bulls from the East because good ones would not bring returns to the shipper. The inevitable result was too many inferior, cat-hammed steers, with white faces their only recommendation.

Fortunately, the general improvement in conditions brought into the business a goodly number of practical, deep thinking men who realized that beef quality and character must be reckoned in the game, and a number of excellent herds have been established. Recent sales show that good cattle are appreciated and sell at good prices.

Turning Good Things to Good Account

Nature has been lavish in her gifts, and we are beginning to turn the good account and show the world that our excellent climate, coupled with rich and abundant pasture and judicious feeding, is capable of producing the best. Recent showings by our state university and individual breeders abundantly prove this. We welcome good cattle and invite high class competition; we do not want cat-hammed culls just because they have white faces.

Our first Herefords of consequence came from the Governor Sparks herd at Reno, Nevada, which was a splendid herd gathered together at great expense and care. Owing to reverses, the worst of which was an exceptionally severe winter in Nevada, Sparks lost about 80 per cent of his range herd of several thousand head. Characteristic of Herefords, it was found on the spring roundup that 85 per cent of the cattle surviving had white faces.

While this was encouraging to the Hereford breeders in a general way, the happening was disastrous to Governor Sparks. The greater part of the older cows were sold to a breeder and formed the nucleus of what is now the largest registered herd in California, but because of discouragement much of the young stock was not recorded, although many of the cattle and their descendants are still in California herds, doing their share to improve our beef cattle.

Another herd that did much to establish Herefords on the Pacific Coast was the speindid one of Jack Splawn of Washington, previously of Missouri, which was sold to California breeders some years ago. A few of the good females found their way into the state university's herd, and they have left a splendid impress upon it. The balance are mainly in the hands of one of our best breeders, where they are giving a good account of themselves.

We ha·e a wide range of climates and find that Herefords adapt themselves to the feed and conditions, whether in the heat of our valleys or the rigors of the high Sierra. Alfalfa is our greatest single feed, but we have a variety of grasses and native clovers. Alfilaria is a succulent plant with a wide range, that is loved by all stock. Barley and the grain sorghums are our best grains for fat producing. Little Indian corn is raised or fed as grain, but its use along with sorghums for silage is steadily increasing.

One of the encouraging Hereford signs—and there are many—is found in the fact that Miller & Lux, with headquarters in San Francisco but ranging their great herds all over the Pacific Coast, raising tens of thousands of cattle and requiring about 1,000 bulls, have changed almost entirely to Herefords in the past ten years. Hereford breeders do not need to be told that there are reasons.

Our Pacific Coast shows made fine records last year, the judges from other sections frankly admitting that the number and quality of our cattle was a surprise to them. We are anxious to do still better this year and hope to see more outside herds shown. Many new herds are forming and I know that with many of us quality and breed character will be our slogan.

I feel it is our mission and privilege as breeders to show the difference between low grade stuff and real cattle. California is now on the Hereford map and coming fast.

BELKNAP DUROCS AVERAGE $167

The dispersal sale of Duroc-Jersey sows and gilts held by Dr. L. J. Belknap, San Jose, Wednesday, March 10, hardly came up to expectations. The attendance was small, very few breeders being present. The fact that a number of the best females were sold either open or bred late had an effect on the prices. An average of $167 was realized on the stuff of breeding age. The top of the sale was a daughter of Orion Model Jr., going to Diablo Stock Farm, Danville, for $530. The next high price was $525, at which figure J. L. Bowden of Hughson secured one of the best things in the offering.

Cols. Leachman and Snook sold the offering in a capable manner.

The offering sold as follows:

1. J. L. Bowden, Hughson, $525.
2. Diablo Stock Farm, Danville, $530.
3. J. L. Bowden, $175.
4. Western Laboratories, Stockton, $150
5. C. E. Lammiman, Palo Alto, $140.
6. Bisceglan Bros., San Jose, $80.
7. Elmer Lamb, Ceres, $65.
8. Bisceglan Bros., $167.50.
9. Cv M. Clark, Modesto, $140.
10. Bisceglan Bros., $120.
11. Geo. Goodwin, San Jose, $55.
12. Diablo Stock Farm, $235.
13. Diablo Stock Farm, $360.
14. Western Laboratories, $150.
15. Western aboratories, $75.
16. Western aboratories, $70.
17. Elmer Lamb, $65.
18. J. L. Bowden, $85.
19. Cv M. Clark, $65.
20. Elmer Lamb, $90.

CONSERVE FEED

An Oxnard subscriber, John Eastwood, sends in the following dry year hint:

Nobody knows what treatment the weather man has in store for us during the next few weeks. But we do know that to conserve our stock feed will be a good practice under any circumstances. This can best be done by the use of a cutting or grinding machine and an application of 10 or 20 per cent molasses. Bean or grain straw or corn stalks where thus treated become nice feed. With a little persistent effort a lot of waste hay can often be collected from the feed racks and if thus treated becomes quite a help. In fact, if each farmer conserves to the utmost, the saving throughout the county will reach a figure of no small importance.

A question which has a pertinent suggestion is, "Why not plan at once for an increase of silo capacity and growing of more silage crops?"

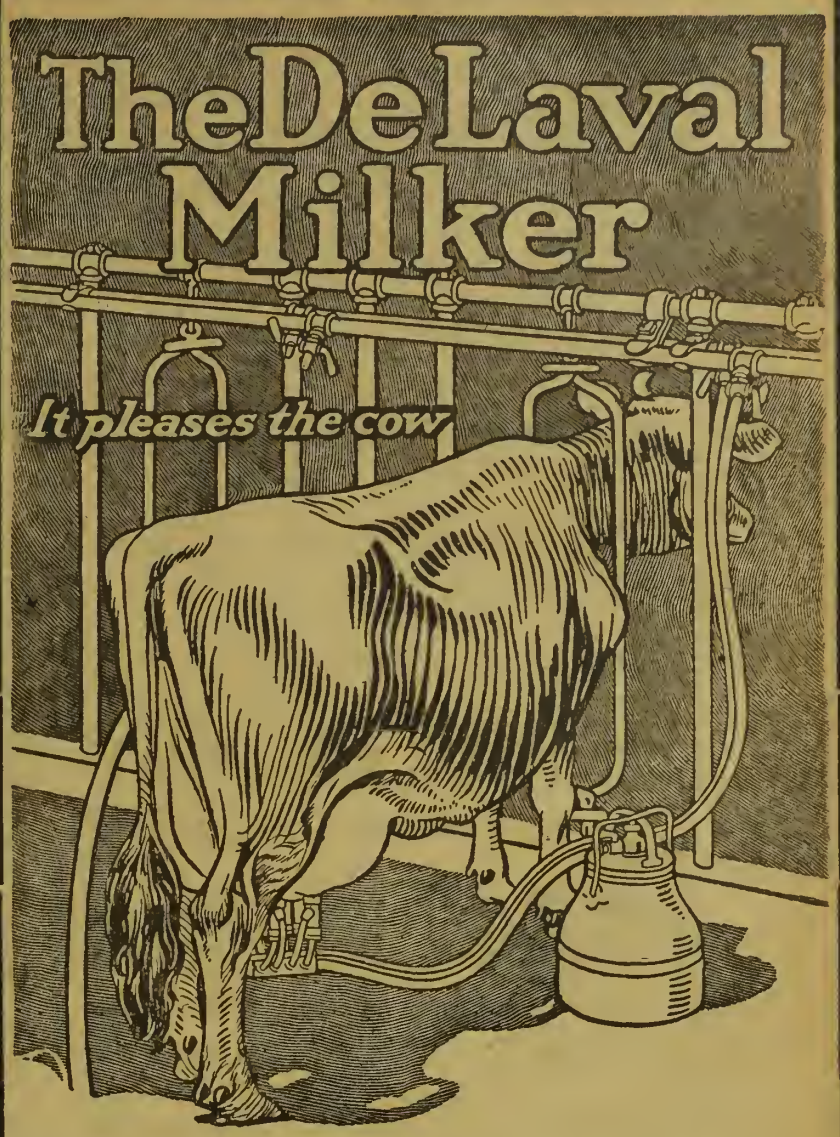
COTTONSEED MEAL FOR WORK STOCK

One pound of cottonseed meal per day for each 1,000 pounds live weight is the most satisfactory quantity to feed work animals, according to recent experiments conducted by the United States department of agriculture. A test in feeding cottonseed meal to work horses and mules at the government farm, Beltsville, Maryland, was begun in 1918, and continued last year. When the meal was fed in large quantities harmful effects were apparent, however, indicating that cottonseed meal, like any other high protein feed, must be fed with care to horses and mules.

MINERAL MATTER AND MILK

Experiments conducted by the bureau of animal industry, United States department of agriculture, with dairy cows, are showing an important relation between milk secretion and certain mineral substances. Feeding compounds of phosphorus and calcium have resulted in a decidedly beneficial effect on the milk flow in both quantity and fat content.

It has been shown also that a deficiency of phosphorus in dairy rations has a detrimental effect on milk secretion of cows and growth of calves. A remedy was found in the addition of sodium phosphate to rations deficient in phosphorus. The work is being continued.



The Name Insures Satisfaction

The De Laval Milker is sold with full knowledge of the fact that more is expected of the De Laval than of any other milker. For over forty years the name DE LAVAL on dairy machinery has stood for highest value and service to the user.

The De Laval Milker is a distinctly different type of machine from other milkers, and was designed with two chief objects in view—the comfort of the cow and ease of cleaning.

The Udder Pulsator, with its alternating action and positive, uniform pulsation, pleases the cow and induces milk secretion. The simple and sanitary design of all parts with which the milk comes in contact, and the special quality of the rubber used, make possible practical sterilization and production of milk of higher sales value.

The De Laval Milker has been in daily use for three years on cows of every breed, as well as in producing certified milk and in A. R. O. work.

The De Laval Company's well-known facilities and reputation for service are an assurance of lasting satisfaction to users of De Laval Milkers.

Ten Reasons for a Silo

A. L. Haecker, writing in a recent issue of the Jersey Bulletin, gives the following ten reasons for using a silo:

1. As the principal business of farming is to make money, the silo, especially on the stock farm, will best accomplish this end.

2. Corn silage is the farmer's cheapest source of digestible carbohydrates. As this is the principal food element required by our domestic animals, it certainly is wise to provide it.

3. Summing up all the experiments conducted by some 23 different state experiment stations over a period of 15 years, silage has proven the most economic food for the production of stock and stock products.

4. There are about one-half million silos now in use in the United States, and it is difficult to find a user who is not more than pleased with the results from his silo. Silo salesmen use a slogan, "Ask the man who has a silo."

5. The greatest expense connected with the livestock business is the cost of feeding the animals. The silo will lower this cost and therefore it should be one of the first considerations of the stock keeper.

6. The silo stands ever ready as an insurance against many of the common crop failures, especially such failures as damages from early frost, drouth and hail. Wet seasons often prevent the putting up of a crop of clover or alfalfa; this can be saved in the silo. Whatever is grown in the way of forage can be siloed and preserved for future use.

7. The silo is a labor saving equipment and it saves in storage space. Eight times more feed can be stored in the silo than in the mow. Cattle can be fed quickly and easily from the silo, as it is in a condensed form, close to the point of feeding, and is always in condition for feeding. Many feeding arrangements require the hitching up of a team to a wagon or cart and the hauling of feed from one place to another. A silo properly placed will do away with this.

8. Silage is a succulent, grass-like feed, easily digested, and seems to stimulate digestion. It has much the same effect as grass, giving thrift to the animal; and less sickness is experienced among the stock when good silage is fed. Silage stimulates the milk flow, and all milking stock should receive it. Silage is cooling and appetizing and it prevents many of the troubles resulting from the over feeding of concentrates.

9. Experiments and experience have taught that the most profitable feeding is liberal feeding, such as will supply the animal with its requirements. Quick growth is profitable growth, large production is profitable production, and the feeder of silage is more inclined to feed well, which means profitable feeding. The man with the silo is supplied with a large amount of good feed, and in emergency it can be carried over for several years and still can be used with good profit.

10. Competition is keen in all lines of industry, and the stock keeper with a silo has an advantage over his neighbor without one. In order to compete with the silo keeper, all stock keepers must use silos. World competition in growing stock and producing stock products will require the American farmer to use the best and most economical means. With the silo we need fear no competition from any country of the world.

TEST YOUR COWS

"It isn't always the man who is doing the most work that makes the real money with dairy cows," says E. M. Harmon of the Missouri college of agriculture. "Too many men have among their herds cows which not only are not paying, but which are actually eating up the profits made by the rest of the herd.

"We are continually finding examples of this over the entire state. One man in Webster County said recently that when he joined the cow testing association last June he was milking 50 cows. With the aid of the association he eliminated 26 and is making more profit from the remaining 24 than he made on the whole 50. In addition to that he reduced his labor by one-half. A neighbor of his started in a year ago with a herd of 37 milkers. He has reduced that number by 14 with the same result—more profit from fewer cows.

"One man in a cow testing association recently sold a cow which he said was annually losing him more than it cost him to have his entire herd tested.

"After allowing a fair amount for labor and interest, in addition to feed, it was found that 36 per cent of the cows in the Webster County association last year were losing their owners money. It is safe to say that the cows in this association were well above the average Missouri cow. But even using these figures as a basis and granting that only 36 per cent of the 800,000 cows in Missouri are losing money, we find that over 330,000 of

Longheath Ormsby Johanna

First grandson of Sir Pietertje Ormsby Mercedes ever sold at public sale in West. Consigned to Guaranty Sale by Longheath Farm, Falion, Nevada.

Madrigal Mooike 2d

Thirty-two pound three year old. Consigned to Guaranty Sale by W. J. Higdon, Tulare.

Every Female in our consignment to the Sacramento Sale has been bred to---

CARNATION KING SYLVIA

—Son of the famous May Echo Sylvia

or—

MATADOR SEGIS WALKER

—whose Get won 10 first prizes out of a possible 23 at the Portland Show

This is an exceptional opportunity for you to get a good foundation cow for your herd and possibly—a son of one of our famous herd sires, when she calves. Five females and one bull are to be sold—as follows:

Cantate Domino Sir Skylark 3d (No. 232525). Born 3-2-14. Record at 5 yr. 7 mo. 12 da. M-606.1, B-27.30, M-2402.4, B-111.119 (30). A young cow in her prime and producing heaviiy. In conformation she is a beauty. Straight as a iine, very square hips, fine shouider, neck and head. Sire: Dutchiand Governor Sir Coiantha No. 90477. Bred 1-11-20 to Carnation King Sylvia.

Edna De Koi Sir Skylark 3d (No. 241026). Born 4-18-14. Record at 4 yr. 4 mo. 16 da. M-454.7, B-25.65, M. 2060.2, B-97.177 (30). An unusuaiiy nice cow, straight as a iine with good heart and middie and an excellent udder. A persistent producer as is shown by her record. Sire: Dutchiand Governor Sir Coiantha No. 90477. Bred 1-12-20 to Matador Segis Walker.

LaConner Pontiac Becky (No. 355022). Born 12-17-15. Record at 3 yr. 11 mo. 20da. M-453.0, B-24.017. A grand young cow backed by Morris breeding. Individuaiiy very fine, and of excellent dairy type. A persistent producer and will make a good record next year. Made her last record without any fitting. She is three-quarters biack, straight with good bone and a fine udder. Sire: Segis Pontiac Acme No. 107557. Bred 1-11-20 to Matador Segis Walker.

LaConner Pontiac Bessie (No. 384411). Born 5-4-17. Record at 2 yr. 6 mo. 2 da. M-423.0, B-17.493. Another Morris bred heifer of excellent type. Very iong and strongiy made. Good ioin and excellent middle. Udder ievei and of good quaiity. A fresh heifer just starting to produce. Sire: Segis Pontiac Acme No. 107557. Bred 3-3-20 to Carnation King Sylvia.

Lady Coloma Geische (No. 318889). Born 12-26-15. Record at 3 yr. 10 mo. 2 da. M-447.9, B-24.721. A nice individuai. A show cow in every way and one that wiii do credit to any man's herd. She is square behind with smooth shouiders, good depth and an excellent udder. Sire: Prince Priiiy Gelsche, No. 72922. Bred 1-15-20 to Carnation King Sylvia.

—See this wonderful Bull.

Duke Finderne Fayne Hartog (No. 293971). Born 8-14-19. Here is a wonderfui 7 months oid son of Finderne Mutuai Fayne Vaidessa (No. 137495), from Von Heim Mary Hartog (No. 284404), a 31-ib. senior 2-yr. old cow. He is backed by high ciass breeding, straight and very long with good hips and loin and excellent shoulders. About ¾ black. A spiendid opportunity for you to get an exceptional herd sire.

Write us your needs—if you are in the market for a choice sire, or if you need some good foundation females write for our special list No. 300.

Carnation Stock Farms

Office: 1083 Stuart Building, Seattle, Wash.
Farm: near Tolt, Carnation, Wash.

them are kept at a loss. In other words, the farmer of Missouri will feed and milk over 330,000 cows tonight and pay those cows for the happy privilege of doing so. There is one way to find out which ones are making the money. That is the use of milk scales and the Babcock test and a cow testing association."

MILKING A COW

Not long ago a certain farmer had occasion to milk a cow. He called in a member of the cowboys' union and sent him to bring the cow from the pasture. When she reached the yard a skilled gate swinger opened the gate, and after the cow had passed through, closed it again. An experienced water pumper filled the tank and the cow drank her fill of the pure water.

She then passed into the barn, where a member of the silage slingers' union gave her her supper. An expert udder rubber removed the dust from the bag and teats, under the supervision of an inspector from the health department. In the meantime the local representative of the hired girls' union had washed the milk pail, the milkstool boy (an apprentice) brought the stool, and the farmer sat down and milked the cow.

This is not a true story.

But here is one that is.

It is told by Mr. D. O. Thompson, secretary of the Illinois Agricultural Association, as follows:

"We recently had occasion to move a telephone connection about six feet along the wall. To do this required the following men: First, a carpenter removed four screws and took down a piece of molding. Then the telephone company electrician moved the wiring and attachment, and since the desk buzzer is not standard telephone equipment, to move that required the services of another electrician. Then the carpenter came back and replaced the molding. A considerable amount of plaster had fallen on the carpet, and the services of a janitor were required to clean it up. The job is not yet finished. There are two holes in the plaster where the telephone used to be. It will require the services of a mason to fill these holes, and later the services of a decorator to calcimine over this spot."—The Prairie Farmer.

HAAG AND BERNSTEIN SALE

The Haag and Bernstein sale of Poland China sows at Hanford Saturday, March 13, brought very conservative figures. The top of the sale was No. 34, an excellent sow of Liberator, purchased by Alex D. McCarty of Modesto. McCarty also bought the highest priced spring gilt at $200. Will Bernstein of Hanford made a good selection in buying a yearling gilt sired by Miller's Long Chief at $200. The two top gilts were from the John M. Bernstein consignment. The three Liberator boars from W. L. Haag & Son consignment sold for $610. These pigs were from a sow Messrs. Haag bought in Missouri last fall at a good figure. In addition to the $610 realized from the three pigs, Haag & Son have an outstanding herd boar prospect reserved for use in their own herd, a high class sow and four classy gilts worth much more than the cost of the sow to show the profit that can be made with high class hogs. The offering sold as follows:

1, Fred Northrup, Selma, $195.
2, C. F. Fish, Corcoran, $115.
3, W. Bernstein, Hanford, $85.
4, H. D. McCune, Lemoore, $175.
5, C. B. McNeil, Fresno, $145.
8, A. J. Van Cleef Riverdale, $135.
9, J. A. Crawshaw, Hanford, $85.
10, A. J. Van Cleef, $100.
11, A. D. McCarty, Modesto, $200.
12, H. D. McCune, $125.
18, H. I. Marsh, $135.
19, E. S. Myers, Riverdale, $75.
23, W. Bernstein, $200.
24, W. Bernstein, $90.
26, W. L. Haag & Son, Hanford, $70.
28, C. N. Clark, Jr., Modesto, $105.
34, A. D. McCarty, $300.
35, P. E. Mitchell, Atwater, $165.
35x J. M. Bernstein, $150.
38x W. R. Nance, Stratford, $85.
39x Les McCracken, Ripon, $75.
40x Glenn Smith, Hanford, $90.

THE ABSENT MINDED BISHOP

An absent minded bishop could not produce his ticket to the railway collector. "Never mind, my lord," said the porter. "It's all right, anyway, whether you find it or not."

"O, no, it isn't," said the bishop, turning out his pockets. "I must find that ticket, for I want to know where I am going."

Holsteins of Unsurpassed Excellence

80 Registered Holstein Cows, Heifers and Bulls 80

The Guaranty Sale

State Fair Grounds
Sacramento, Cal.

Thursday, March 25, 1920

In previous announcements we have gone into some detail respecting the 71 outstanding cows and heifers in this sale, and the scores of interested persons who have written for catalogs now have a copy of the catalog for study of the pedigrees, and sale day will uncover the fact that we have understated rather than overstated the wonderful individuality of these females.

In this the final announcement before the sale, we want to go more fully than before into the high excellence of the nine richly bred bulls to be offered, and we want to urge upon owners of high class herds of grade Holsteins the advisability of attending this sale. We know that every bull in this sale is qualified to head a herd of registered females, and we are at the same time morally certain that some of these bulls will sell at prices well within what some owners of grade herds are willing to pay for bulls of this character. For it is a fact that within the past two years a very considerable number of bulls have gone to head grade Holstein herds in this state at prices ranging from $750 to $1500, and they have been first class investments at the price.

Following is a Complete List of the Nine Bulls to be Offered in This Sale:

KING PONTIAC ALCARTRA PRILLY—Born March 31, 1919. Consigned by Bridgford Holstein Company, Patterson, Calif. He is sired by King Segis Alcartra Prilly, the richly bred bull that has been three times grand champion at California State Fair, and whose get have been the sensation of the show for the past two years. His dam is Spring Farm Pauline Pontiac 2nd, who made over 33 lbs. butter in 7 days last year. SHE IS NOW FRESH AND ON TEST AGAIN AND AT THIS WRITING HAS OVER 35 LBS. BUTTER FROM OVER 775 LBS. MILK IN 7 DAYS TO HER CREDIT. She is by a 37 lb. son of King of the Pontiacs. This is absolutely one of the best bulls ever sold out of the Bridgford herd, and he is a splendid individual.

LONGHEATH ORMSBY JOHANNA—Born May 11, 1919. Consigned by Longheath Farm, Fallon, Nev. He is sired by King Ormsby Canary Johanna, who is by Sir Pietertje Ormsby Mercedes, the greatest sire of long distance producers and show ring winners in the world, out of the 34.59 lb. cow Glen Canary De Kol, and therefore full brother to Glen Canary De Kol 2nd who made 1323.36 lbs. butter in one year as a junior 4 year old, and 951.05 lbs. in one year at 24 months. The dam of this great youngster is a 19.21 lb. junior 3 year old whose dam is a 32 lb. granddaughter of Colantha Johanna Lad. He is a high class individual and is the first grandson of Sir Pietertje Ormsby Mercedes ever offered at public sale in California.

TOSANTOS WALKER PONTIAC—Born Feb. 11, 1919. Consigned by E. D. Barry, Jr., Daggett, Calif. He is sired by King Korndyke Pontiac 20th, the great $6500 son of Miss Valley Mead De Kol Walker, whose first two daughters to freshen have made sensational records at age. The dam is Miss Filled Korndyke Walker a 26.35 lb. junior 4 year old daughter of Prince Geische Walker. Second dam a 29 lb. daughter of Korndyke Queen De Kol's Prince. The dam is also full sister to Miss Gelsche Walker Korndyke who recently made over 32 lbs. butter from 705 lbs. milk in 7 days. The dam of this youngster is a most promising candidate for a very large record at mature age. The bull himself is an excellent individual.

ROSAMAINES PONTIAC POSCH—Born Nov. 14, 1918. Consigned by Rosamaines Rancho, Riverside, Calif. He is sired by King Pontiac Netherland Segis 3d, one of the very best young sires yet developed in California. The sire is by a son of King of the Pontiacs and out of that great 34 pound cow Gerben Abbekerk Maid, who is by Sir Skylark Ormsby Hengerveld. The dam of this bull is Locust Terrace Gold Drop, a high class cow that made over 28 lbs. butter from 750 lbs. milk in 7 days, and she has a 25 lb. 3 year old daughter and another now on test as a junior 2 year old, full sister to this bull, with over 17 lbs. to her credit at present. He is of correct type and a good bull any way you look at him.

BULL—Born Aug. 14, 1919. Consigned by Carnation Stock Farms, Seattle, Wash. He is sired by Finderne Mutual Fayne Valdessa, who is out of a 3 year old that made over 36 lbs. butter in 7 days and over 1200 lbs. butter in one year. The sire is by King Valdessa whose dam is the 41 lb. cow Valdessa Scott 2nd. The dam of this youngster is Von Heim Mary Hartog who made over 31 lbs. butter in 7 days as a 2 year old. Individually he is as good as his breeding and should find a home in a good herd.

PRINCE WALKER CORNUCOPIA 8TH—Born April 20, 1919. Consigned by Santa Anita Rancho, Santa Anita, Calif. He is sired by Prince Walker Cornucopia, son of Prince Gelsche Walker and the 36 lb. cow Alba Sadie Cornucopia Crettia. The dam is a 305 day record daughter of Mosetta Mutual Paul Johanna who made 1117 lbs. butter from 26868 lbs. milk in one year. The three nearest dams of this high class young sire all have good yearly records, and he will be a valuable sire for someone. He is a high class individual.

BULL BORN MAY 8, 1919. Consigned by W. J. Higdon, Tulare, Calif. He is sired by King Korndyke Pontiac 20th, the $6500 son of Miss Valley Mead De Kol Walker who is regarded today as one of the very best young sires of the breed. The dam is the famous heifer Madrigal Mooike 2nd, who made 759.52 lbs. butter from 20160.5 lbs. milk in one year as a junior 2 year old and at last freshening as a senior 3 year old made 32.91 lbs. butter from 567.5 lbs. milk in 7 days. She is unquestionably one of the greatest producing heifers yet developed in the west and is most promising for a very large record at mature age. This youngster is an individual of great merit and should go to head a high class herd.

SIR TOYON MODEL HARTOG—Born April 29, 1919. He is sired by Von Heim Aaggie Hartog, whose dam is a 31 lb. 2 year old. The dam of this bull is the 23 lb. junior 2 year old Korndyke Model Hartog 3d, who sold at public sale for $2600 before she dropped her first calf. She is now on yearly test and has 709.72 lbs. butter to her credit in 304 days as a junior 2 year old. Her dam made over 30 lbs. butter in 7 days and 872.85 lbs. in 305 days as a junior 4 year old, and over 31 lbs. in 7 days as a 5 year old. She was also first prize 3 year old at National Dairy Show in 1918. The third dam made over 30 lbs. butter in 7 days and 1129.20 lbs. in one year. This bull is backed by three generations of dams that rank among the greatest in the west, and there is a wealth of world's record backing on the sire's side. Here is a bull that no breeder can afford to overlook.

ENSIGN KORNDYKE MODEL PONTIAC—Born April 6, 1919. Consigned by A. E. Smith, Sumas, Wash. The sire is Chimacum Spring Farm King Pontiac, whose young daughters are making extraordinary records with their first calves. The dam is Korndyke Model Hartog 2nd, who made over 27 lbs. butter in 7 days as a 3 year old and now on yearly test promises to make around 850 lbs. butter in one year. Second dam a 31 lb. cow that made 872.85 lbs. butter in 305 days as a junior 4 year old, and was first prize 3 year old at 1918 National Dairy Show. Third dam a 30 lb. cow that made 1129.20 lbs. butter in one year. This is a show bull of rare excellence. When his dam completes her record he will have an average of about 925 pounds butter in one year for five of his seven nearest dams, and his dam holds out every promise of making a very large record in mature form. This bull is backed by type and production of the first quality, and he should command attention in any sale ring where buyers of the best gather.

While we have utilized most of the space this week with descriptions of the nine bulls in the offering, don't forget that there are in the sale

11 Cows with Records from 30 to 35 pounds Butter in 7 days.
20 Cows with Records from 25 to 29 pounds Butter in 7 days.
A wonderful lot of 2 year olds with records up to over 24 pounds Butter in 7 days.
An extra choice lot of 3 year olds with good records.
And that practically all of the females are bred to 20 of the best bulls on the Pacific Coast today.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested and sold subject to 60 day retest by the buyer.

Supplemental Feeding of Range Cattle

By George H. Wilson, University of California

BY supplemental feeding of range cattle is meant the provision of feeds other than native pasture at such times of the year as the native grass is short, usually during winter months on winter ranges.

Cattlemen know all too well the picture of the cattle, fat and sleek as they come off of the summer range and how three months later most of us are quite well pleased if they are merely thrifty though 200 pounds lighter, and the ranches are few which have not lost cattle in the streams this winter due absolutely to weakness, unless they provided supplementary feed to carry them through.

Consider for a moment the effects of the lack of feed. There is first the loss of 150-250 pounds of flesh and fat, a loss which must be replaced in full before a pound of real gain is put on the following year. In the case of the breeding herd, the loss is made up again but only at the expense of grass which might well be developing a steer. In the case of the steer, it is just a loss of 200 pounds at market price, to be replaced only by feed which might go to make legitimate gains.

If it were only a proposition of living through the winter months on a part of the fat accumulated during the period of abundant feed, there might be some justification, but the losses are usually carried to a degree of emaciation or breaking down and sloughing off of the body tissues as shown by the mucus of the intestinal tract, the rough coat and the lack of thrift. With the coming of the new grass, the slow and costly process of rebuilding these tissues is necessary before the storing of muscle and fat can commence, a total loss of several weeks and much good grass consumed in the process of tissue rebuilding.

This loss of time in tissue rebuilding and the replacement of lost weight means many of the two, three, and even fours do not have time during the summer to get into butcher condition so must go through the process another year hoping for better luck.

This carrying of an excessive number of 3's and 4's means an equal reduction in the beef output or money return of the ranch.

The average cattleman of California runs 75 head of cattle. Let us say, 20 cows, 15 yearlings, 15 two's, 15 three's and ten four's. He turns off 15 head per year at $125 per head, totaling $1,875. Why could he not run 28 cows, 21 yearlings, 21 two's and five three's, turning off 21 head per year at $125 per head, amounting to $2,625, or $750 more, giving $350 for hay and labor and $400 and the satisfaction of good ranching as profit.

No effort has been made to describe the actual loss of life, the animal mired down in the stream on account of being too weak to unloosen a foot caught by the suction, or the loss of both cow and calf due only to lack of vitality to carry them through the critical calving period.

What, then, are the possibilities of supplementary feeding?

Maintenance of fat accumulated on cheap range.

Maintenance of thrift of animals.

The stock is able to make the best use of spring grasses from the first.

Increase in the carrying capacity of summer ranges.

Practically insures all two year olds coming off fat in the fall.

Insures cows being strong enough to calve easily and give abundant flow of milk.

Makes early calving profitable.

Early calving means long season of milk for calves and possibility of finishing almost all breeding before bulls are sent out on summer range.

Feeding Experiences

Mr. Church, of the Lime Kiln Ranch near Auburn, says they did not feed the 1918 calves the first winter, but they have fed the 1919 calves and that the 1919 calves are now just as large as the 1918, or one winter's silage and hay fed to calves saved one whole year's feed to a steer.

Robert Yelland, manager of the C. C. Moore ranch in Shasta County, has been feeding steers on corn silage and chopped alfalfa hay at the rate of 16 pounds chopped hay and 22 pounds of silage per day, getting gains of 2.7 pounds per day.

The Kansas state agricultural college at the Fort Hays range has for seven years been carrying on work with breeding heifers, dividing them into four groups:

Group I. Average ranch feed, bred to calves at two years.

Group II. Supplemental winter feed, bred to calves at two years.

Group III. Average ranch feed, bred to calves at three years.

Group IV. Supplemental winter feed, bred to calves at three years.

Groups I and IV have been dispensed with, Group I being very unsatisfactory calves and Group IV being too expensive.

The results from Groups I and III are about equal, or in other words, supplementary winter feeding saves one year of the life of a heifer and makes room on the range for one more steer.

Now how are these results to be accomplished? It is within the province of this article only to suggest the use of silage, the sorghums or corn being preferable, or of sudan grass, rye or grain, clover or alfalfa hays. A small amount of concentrate may in some cases be advisable, but roughages will be the main dependence, the size of the ration from 8-25 pounds per day, varying with the supply of supplemental and native feeds. It is suggested that preference be given to: 1, cows with calf; 2, calves; 3, yearlings; 4, two's.

LIVESTOCK BREEDERS MUST COOPERATE

Dr. R. H. Williams, animal husbandman of the Arizona agricultural college, speaks for better cooperation among livestock breeders. He says:

"The modern way of doing a big job is team work. Cooperation applies to business as well as football. In the livestock business allliances among breeders, dealers, advertising mediums and breeders associations, with their efficient machinery, are necessary to put it across. We may call this a ring into which one must become initiated and continue to function according to the best interests of the group, clique or fraternity.

"A breeder who forms no alliance with livestock papers, with his breed association or the leaders and promoters of the breed, occupies a solitary position which means failure. Breeders are either in the select circle of friends and coteries or else they are without. It is not necessary for those in their set to feel that they are enemies of those in the other group, but one must belong to a set to succeed.

"The advantages of lining up with the promoters of any particular breed are many. In the first place there is a sympathy and good fellowship in meeting and associating with people with mutual interests. A man who loses this sociability with his fellow breeder and is without desire to cooperate with others in the business soon loses interest and blames the breed for his failure. On the other hand, there is no greater incentive and inspiration for progress than to cooperate with the other breeders and boost your own breed at all times."

ANOTHER WORLD'S RECORD IN MORRIS HERD

Miss Aaggie Acme Burke, the greatest two year old heifer yet developed by A. W. Morris & Sons Corporation, Woodland, has just completed her year's test with 24,338.8 pounds milk and 1,034.44 pounds butter. She freshened at two years and three months of age, and her milk production is a world's record in class, while her butter record is highest in class in California, displacing the former record of 851 pounds held by her three-quarter sister Aralia De Kol Mead 2nd. Miss Aaggie Acme Burke is by Segis Pontiac De Kol Burke, and out of Aaggie Acme of Riverside 2nd, whose strictly official record of 1,331.78 pounds butt r in one year is the highest in the world. This wonderful heifer has a son just past a year old, sired by W. J. Higdon's great buil King Korndyke Pontiac 20th. He was first in class at San Francisco in November in a large class of good ones, and is fast developing into an outstanding buil. He has been consigned to the National Sale to be held at St. Paul in June.

TILLY ALCARTRA COMPLETES HER SEVENTH LONG DISTANCE RECORD

Tilly Alcartra, the greatest food producing machine in the world, has completed her seventh consecutive long distance record. She was carried only 305 days this time, as she is due to calve again within 12 months of her previous freshening and even now will be milking right up to within a week or ten days of calving. In 305 days she made 935.15 pounds butter from 23,684.1 pounds milk, which gives her a total of 180,460.2 pounds milk and 1,076.51 pounds butter, and average of 1,010.93 pounds butter and 25,780 pounds milk, a record that is not closely approached by any cow of any breed in the world.

Not only is Tilly's latest record a wonderful production during the seventh consecutive year of her milking career, but it was made under most extraordinary conditions. It will be remembered that early last summer she was shipped to Carnation Stock Farms, Seattle, Washington, where she was bred to the world famous $106,000 bull Carnation King Sylvia. On her way home she was guest of honor at a luncheon given by the Portland Commercial Club, Portland, Oregon, in one of the leading Portland hotels, and was afterward placed on exhibition for several hours in Portland's largest department store, where thousands of people jammed the store to see her. After coming back to California she was shipped to San Francisco, where she was the guest of the San Francisco Chamber of Commerce at a luncheon at the Palace Hotel. She was then placed on exhibition at the California International Livestock Show, and from there went home to round out her busy year. While the discomforts of travel caused her to drop off in production at times, she always came right back as soon as she was permitted to attend strictly to her life's work of producing milk, and the end of her 305 day test tells the story as to how well she stood up under a program that would have wrecked most cows. She is today in exceilent physical condition, taking on her usual amount of flesh, and is to drop a real wonder-calf on March 30.

The Greatest Food Producing Machine In the World

Tilly Alcartra, the wonder cow, has just completed her seventh consecutive record and now has to her credit a total production of 180,460.2 pounds milk and 7,076.51 pounds butter. Tilly is owned by A. W. Morris & Sons, Woodland.

NOTES OF CALIFORNIA CATTLEMEN'S ASSOCIATION

The membership campaign of the California Cattlemen's Association will open in Southern California with a meeting at Ventura on March 27. This will be followed on April 3 with a meeting at some point adjacent to Los Angeles, not yet selected.

Activities will shift to Imperial Valley on April 10 with a meeting which will be held by Imperial County cattlemen at Brawley. All of the Southern California Counties, and a number from the north will cooperate at the semi annual convention which will follow the Brawley meeting, and will be held in Los Angeles on April 15, 16 and 17. The last day will be given over to a big barbecue. Speakers of national prominence are expected to address the convention.

* * *

The February break in the drouth has saved Northern California cattle, at least temporarily. County secretaries in the Cattlemens' Association, reporting the conditions of the ranges, state that if the March rainfall is normal there will be no necessity of shipping any cattle out of California. From all over the state, however, there have come letters commending the action of the California Cattlemen's Association in preparing for the emergency that threatened. The association's policy of getting ready in ample time resulted in arrangements that would have permitted cattlemen to ship their stock to other pastures outside California the moment the need became apparent. This is the first time in the history of the cattlemen of California that such machinery has been at the disposal of the stock raisers. In other years of great drouth cattlemen have had to rely upon their individual efforts to help themselves, and many delayed until the cattle were so weak that they could not be loaded on trains. One well known cattleman said recently, "The old days of unpreparedness are gone, and it is my fervent prayer that they never will come back." The association's efforts have won it the membership and active support of many producers heretofore outside the organization.

A movement to enlist the support of the government in a campaign for the extermination of coyotes was launched at a meeting of cattlemen at St. Helena, Napa County. A resolution was adopted urging that the department of agriculture secure an appropriation from which to offer a bounty which would be in addition to that offered within the state.

The resolution calls attention to the depredations of coyotes among livestock and points out that the bounties paid by the counties are wholly insufficient to produce the desired results.

LARGE COWS EXCEL IN YIELD

Cow testing records based on 38,532 dairy cows from 110 cow testing associations are being analyzed by specialists of the dairy division, United States department of agriculture. The tabulations have brought out a number of interesting relations between milk production, butterfat test, butterfat production, and income over cost of feed. The larger cows excelled the medium and small cows in production of both milk and butterfat.

The average annual milk production of all the animals was 5,936 pounds per cow, and the average butterfat production 246 pounds. These figures are considerably larger than the average for the United States, indicating that dairymen who are members of cow testing associations either dispose of their poorest cows or else make them more profitable by better feeding and handling.

THE MOUNTAINS

He hath made them the haunt of beauty,
The home elect of His grace;
He spreadeth His mornings on them,
His sunsets light their face.
The people of tired cities
Come up to their shrines and pray;
God freshens again within them
As He passes by all day.

—Jane Taylor.

CITRUS

Box: Lemons, fancy, 3.00@5.75; choice; 4.00@5.00; standards, 2.50@3.00; lemonettes, fancy, 3.00@3.50; others, 2.00@2.50; grapefruit, fancy, 2.50@3.00; choice, 2.00@2.50; oranges, navel, 4.25@6.25; limes, 1.00@1.50 crate; tangerines, 1.50@3.25 per crate.

DRIED FRUITS

Prunes:

Prune prices announced by the California Prune and Apricot Growers, Inc., were for the base prices, according to sizes, and are: 20-30s, 22c flat; 30-40s, 16c; 40-50s, 14c; 50-60s, 12c; 60-70s, 11½c; 70-80s, 11c; 80-90s, 11c; 90-100s, 11c. One cent a pound premium will be paid on fruit delivered before September 20. On small-sized fruit 8½ cents a pound will be paid for 100-120s and 7½ cents for 120s and smaller.

Peaches:

Peach prices announced by the California Peach Growers, Inc., for 1919 crop dried peaches for the domestic and foreign trade; September, October, November shipment, seller's option; guaranteed against our own decline until January 1, 1920, are as follows:

Standard yellows, 14¾c; Muirs, 15c.
Choice yellows, 15½c; Muirs, 15½c.
Fancy yellows, 16½c; Muirs, 17½c.
Extra fancy yellows, 17¾c; Muirs, 18¾c.
Slabs, yellows, 14½c.

For "practically peeled" add 1½c per pound (any grade).

Prices above are all bulk basis.

For packing in 50 pound or 25 kilo boxes add 1 cent per pound.

25 pound or 12½ kilo boxes, all 1¼c per pound.

10 pound boxes, add 2 c per pound.

Blue ribbon peaches packed 2 pound cartons, 12 per case, $10 per case.

Blue ribbon peaches packed 2 pound cartons, 24 per case, $10 per case.

Bakers' special, "practically peeled," 16¾c per pound, bulk basis.

Apples:

Choice (in 50s), 20@20½; extra choice (in 50s), 21@21½; fancy (in 50s), 23@23½.

Figs:

White: Cooking (in 50s), 15@16; choice (in 50s), 17@18; extra choice (in 50s), 19@20; fancy (in 50s), 21@22; extra fancy (in 50s), 23@24; bricks, 12 No. 10s, 1.60@1.67½; bricks, 24 No. 8s, 2.55@2.65; bricks, 50 No. 6s, 4.00@4.15; bricks, 70 No. 4s, 4.20@4.25; layers, No. 10, 2.50@2.80. Calimyrna: Cooking (in 50s), 19; choice (in 50s), 23; extra choice (in 50s), 24; fancy (in 50s), 26; extra fancy (in 50s), 27½; bricks, 10 1-lb., 2.75; layers, No. 10, 2.95@3.20. Black: Standard 14, choice 17@18; extra choice, 18@19; fancy, 19@20.

Pears:

Standard 20, choice 22½; extra choice, 24; fancy, 26@27.

HONEY

Extracted jobbing prices: Water white and white, 18 and 20 per lb.; light amber, 16@18; amber, 14@16½; comb, 25@28 for white and water white and 20@22½ for light amber.

RICE

The market remains inactive, with prices level. Some activity is expected soon, due to the improved foreign exchange situation and need for several short sellers to come into the market to cover. Spot fancy today is 12.00, April 12.00, May 12.20 and choice 25 less. Market practically bare of brewers and screenings.

BEANS

Jobbing price per cwt.: Small white, 6.00@6.25; large white, 6.00@6.50; cranberry, 6.90@7.00; red Mexican, 8.00@8.25; pink, 6.20@6.35; California Bayo, 9.00@9.25; blackeye, 7.10@7.25; red kidney, 13.00@13.25; lima, 11.00@11.25; Garvanza, 9.00@9.75; Kotenashis (in bond), old crop, @10.50; Kotenashis (in bond), old crop,

Dried Peas—California, 5.25@5.40 per cental for green, recleaned.

GRAIN

Wheat: The prices are based upon federal grades and standards at the terminals in San Francisco Bay and Los Angeles, and are as follows, per bushel of 60 pounds:

Hard White—	Per Bushel	Per Cental
No. 1	$2.20	$3.66 2-3
No. 2	2.17	3 61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	$2.18	$3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51½
Club and Sonora—		
No. 1	$2.16	$3.00
No. 2	2.13	3.55
No. 3	2.09	3.48½

The above are minimum prices.

For sacked grain add 4½ cents per bushel of 60 pounds to above prices. Deductions of three-fourths of a pound made for weight of standard grain bags. Wheat grading under No. 3 mixed or smutty wheat will be purchased according to merit.

Oats: Red feed, 3.20@3.25.

Corn: California yellow, 3.20@3.25 per cental; Egyptian white, 3.80@3.85; milo maize, 3.15@3.25.

HAY

Under date of March 13, Scott-Magner & Miller says:

Receipts past week 871 tons, mostly Oregon and Nevada. Receipts from Ne-

vada chiefly alfalfa hay; from Oregon, cheat hay. This is sown cheat more or less mixed with oats and seems to meet with favor of stock feeders. Considerable of this type hay has been purchased for shipment to this market and no doubt will be in general use as our California stocks are fast reducing and from the present outlook it will not be long before wheat or tame oat hay is all consumed. Barley has been unobtainable for some time past. The rain, which was quite general over the state the first of the week, ranging from one-half to one inch, has been of inestimable value to the growing crops and has given hope that the long drouth is broken. Pasture conditions are improved and grass should be plentiful on the ranges in the near future. This weather, together with the shipments of Oregon hay, have had a tendency to keep hay from going any higher and if anything the market can be reported a little easier. The government is in the market this week for 3,500 tons for overseas shipment. This hay must be double-compressed but at this time it is impossible to report whether contracts will be let in this city or sent to the Northwest.

We quote today wholesale prices in carload lots as appear from dealer's transfers upon the hay market in San Francisco, for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat Hay (light 5 wire bales)	38.00@41.00
No. 1 Wheat or Wheat and Oat Hay	35.00@38.00
No. 2 Wheat or Wheat and Oat Hay	33.00@35.00
Choice Tame Oat Hay	37.00@40.00
Other Tame Oat Hay	33.00@37.00
Wild Oat Hay	Nominal
Barley Hay	Nominal
Alfalfa Hay	32.00@37.00
Stock Hay	29.00@32.00
Oregon Cheat and Oat Mixed	27.00@29.00
No. 1 Barley Straw, per bale	.70@ 1.00

Citrus Markets

Los Angeles, March 17, 1920.

Navels are running to large sizes. There are large quantities of 126's and even many of 80's and 64's. These exceptional sizes are forced to sell at much lower prices than preferred sizes. A long premium is sometimes paid on 150's and 176's. Any f. o. b. sales which are made are usually around the $4.50 mark. Shipments aggregating around 1,000 cars weekly.

The supply of imported lemons continues great so that even high quality Californias are forced down to exceptionally low prices.

Shipments

Shipments of citrus fruit to date from Southern California since November 1, 1919: Oranges, 10,715 cars; lemons, 2,199; total, 12,914. To same date last season: Oranges 10,749; lemons, 2,739; total, 13,488. From Central California this season: Oranges, 3,495; lemons, 264; total, 3,759. To same date last season: Oranges, 2,252; lemons, 244; total, 2,496. From Northern California this season: Oranges, 260; lemons, 20; total, 280. To same date last season: Oranges, 234.

FERTILIZERS FOR POTATOES

Near Topeka, Kansas, lives B. H. Pugh, who has been a successful commercial grower of potatoes for 24 years. By request Mr. Pugh prepared an article on potato production for the twenty-first biennial report of the Kansas state board of agriculture. Here is what he says about fertilizers:

"One of the essentials in potato growing, possibly the chief essential, is soil fertility. Seed selection is important, but fertility is, if anything, more important. If our agricultural papers could inspire the farmer to improve the fertility of his acres with as much eagerness as he selects and improves his seed corn, the results would be startling. Fertility is even more important to the potato, because it is a more expensive crop. It cannot thrive on a soil barren of fertility any more than cattle can thrive on a pasture barren of grass.

"The potato plant is a gross feeder. Its root system develops so rapidly that by the time the plant is six inches high the rootlets are meeting across the rows. If fertility is placed within reach, the plant is sure to make quick and vigorous response.

"No fertilizer compares with common barnyard manure in ability to produce substantial crops of potatoes. After experimenting with cottonseed meal and other kinds of commercial fertilizers, using as much as a carload of this goods, the writer has returned to barnyard manure as the most efficient of all, and the most lasting. It should be used liberally, ten to 15 tons per acre—more if convenient. It may be depended upon to produce fine crops for three years and longer, if it is supplemented with crops of green rye planted after potato harvest and plowed under in the late fall or early spring. The persistent use of rye as a green manure crop for potatoes cannot be emphasized too much. It is the cheapest and most vigorous of green manures and produces smooth tubers of good quality. The potato is 78 per cent water and therefore not hard on the soil. It may be grown successively for many years without change, on the same field, if the rye rotation is used. The writer has one field which in 15 years has produced 14 crops of potatoes, the last three averaging 250 bushels per acre.

"No fears need be entertained about the manure producing scab, no matter what the neighbors may say. I am fully aware that there are those that insist that potatoes are made scabby by the use of manure; that it did back in Michigan, or Indiana, where they came from; that they know because they saw it with their own eyes. Likewise, there are some who never think of planting potatoes without getting out the almanac to consult the phases of the moon, fearful lest some incautious move be made that would conflict with the moods of this mysterious orb, and that it possesses some sinister influence by which it breathes damnation upon any crop not planted according to its fitful humors. You may safely ignore the phases of the moon in potato culture, but it is not safe to ignore the use of manure, all that can be had of it, no matter whether fresh or composted.

"Yield is what the grower is after, and the faster the crop grows the larger and smoother the tubers will be. Potato land that will produce 100 bushels per acre under ordinary conditions will easily double in productive ability by the use of this fertilizer. The best seed carefully planted in well prepared land cannot reach large results save in fertile soil, but furnished with this assistance the early potato can produce its crop in an amazingly short time, finishing its growth during the cool nights of spring, and ahead of the summer drouths. On poor soil the crop will drag slowly on in an effort to produce its crop, finally winding up with a small yield of undersized potatoes, to the loss and disgust of the grower. Making the soil rich is not an expense but an investment, and no matter what the crop, it is certain to yield good returns."

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Boulevard, Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Unsigned communications receive no attention.

Forage Poisoning

We have a mule colt ten months old that was never sick before but now is not able to get up. She has no control over her legs. Is it auto ataxia? Her mother died when she was six weeks old and she has been raised on calf meal, cow's milk, eggs and sugar. Lately she has had alfalfa hay and a little barley. Has been kept in a small corral. I saw a similar case in the valley a year ago and have been told that it is all right now. What can we do to hasten recovery?—Subscriber, Blythe.

Formerly this trouble was called spinal meningitis because when animals died with it small inflamed spots were found on the coverings of the spinal cord, similar to those found in the true spinal meningitis. But instead of causing violent and painful contraction of the muscles, as we find in the true spinal meningitis, in these cases we find partial or complete paralysis. It has been found that a mold or fungus on the hay is the cause of the trouble, so it is now called forage poisoning and sometimes referred to as ptomaine poisoning. It is always best to change the feed, as that will avoid adding more to what has already been taken. The best remedy for removing what is now in the bowels is a physic of salts, and to increase the action of the salts a little nux vomica should be added. Mix two pounds of epsom salts, one pound of common salt and half an ounce of powdered nux vomica. Mix thoroughly and divide into eight powders. Give two doses the first day and one a day after until all is used. Give the medicine by dissolving one powder in a quart of hot water and when cool give as a drench. This will remove the trouble from the bowels. To remove the poison that has been absorbed into the system, get two ounces of bromide of potash dissolved in one pint of water and give a tablespoon of the mixture in the drinking water twice a day.

STOCKS OF HIDES AND SKINS

Holdings of hides and skins on January 31 were much larger than on the same date last year, but less than on December 31, according to the monthly report of the bureau of markets, United States department of agriculture.

Total holdings for January 31, 1920, were: Cattle hides, 6,549,550; calf skins, 1,570,718; kip skins, 965,336; horse hides, 277,626; horse fronts (whole), 110,778; horse butts (pairs), 317,311; horse shanks, 53,811; kangaroo and wallaby, 788,479; deer and elk, 237,477; goat, 12,849,532; kid, 926,677; cabretta, 1,887,026; sheep and lamb, 8,763,643; buffalo, 488,224; pig and hog skins (pieces), 75,405, and pig and hog strips (pounds), 1,586,271.

"When water becomes ice, what is the great change that takes place?"

"The greatest change, ma'am," said the little boy, "is the change in price."

WEATHER REPORT

San Francisco, California, March 13, 1920.

The Harrow for Tractor Use

USE behind your tractor a harrow that pulverizes every inch of soil—that prepares a perfect seedbed for the plant roots and thereby increases the harvest. "Once over" the field gives perfect tillage if you use a

Clark
"CUTAWAY"

DOUBLE ACTION
TRACTOR HARROW

The forged sharp disks of toughest cutlery steel cut deep, thoroughly mix the soil and leave it light, mellow and level. Rear gangs are forced to cut exactly midway between front gang trucks. The CLARK "CUTAWAY" Rigid main frame is made of heavy special steel which keeps all gangs from sluing and trailing.

Even, uniform cultivation—clear to the bottom of the furrow—results. Solid disks are furnished if desired, but cutaway or cutout disks, if of CLARK "CUTAWAY" quality, do better work. Don't be influenced against "cutout" disks by manufacturers who are unable to produce an enduring "Cutout" disk of CLARK "CUTAWAY" quality. CLARK "CUTAWAY" Double Action Tractor Harrows have adjustable hitch and are made for any size tractor. Light Service and Heavy Service types. They represent the perfected results of fifteen years' development of tractor harrows.

If your dealer cannot supply you, some other nearby dealer can.

Write for free book, "The Soil and Its Tillage," and complete catalog.

GREATEST OF ALFALFA GROWERS

(Continued from Page 471.)

were sent to Philadelphia, and the whole matter was forgotten by Mr. Miller until a day in early February, when a letter came announcing that Mr. Miller's five acres was amongst the winners. This was highly satisfactory, but rather indefinite. The next information received was a letter containing a check for $1,000 and a package accompanied it containing a gold medal on one side of which was engraved: "Awarded by the Farm Journal of Philadelphia to Nathan Winfield Miller of California as the first prize for an average yield per acre of alfalfa of 7 tons, 748 pounds in the National Prize Crop Contest, 1919."

Notes

This winning field of all American alfalfa fields was seeded with the "ordinary," or Chilean, alfalfa. It was seeded by hand so accurate information as to number of pounds per acre was not available, but Mr. Miller said it would range for the different acres between 15 and 20 pounds.

The broadcasting was done in November or December of 1916. The seed was not inoculated, but native clovers or legumes have grown on the land from time immemorial.

As to fertilizing, none had been given to this land since one of the earlier beet crops, when stable manure was applied. Mr. Miller uses a manure spreader and considers it has paid for itself many times, this not so much because of labor saving as because more efficiency is secured from manure so thoroughly distributed. "It is foolish for any farmer not to supply himself with a good manure spreader."

Another application during the beet cropping period was that of sugar house lime from the nearby factory at Chino. As to soil treatment, the thorough culture necessary in raising beets was all that had been given. As noted, immediately preceding seeding, only disking was given, but the plowing out of the beet crop had called for 12 or 13 inch plowing, and, in addition, the land had been subsoiled with one of the beet crops. The subsoiling was about 18 inches deep.

Report of Supervisors

We, the undersigned, supervisors of measuring and weighing for San Bernardino County, state of California, certify and report the following yield of alfalfa from the five acre tract of N. W. Miller of Chino, in said county and state, viz.:

Date of measuring five acre tract, April 10, 1919; length of tract, 528 feet; width of tract, 412½ feet.

Date of Cutting		Tons	Lbs.
1st—April 12, 1919	Total Weight 1st Cutting for 5 Acres	9	1298
2nd—May 31, 1919	Total Weight 2nd Cutting for 5 Acres	9	275
3rd—July 5, 1919	Total Weight 3rd Cutting for 5 Acres	7	550
4th—Aug. 6, 1919	Total Weight 4th Cutting for 5 Acres	6	290
5th—Sept. 12, 1919	Total Weight 5th Cutting for 5 Acres	2	1900
6th—Oct. 29, 1919	Total Weight 6th Cutting for 5 Acres	2	590
Total		37	903

Samples from each cutting for moisture test being held by Supervisor E. Rhodes. Date of Report, November 25th, 1919.

R. A. Condee, P. H. Wright, Edwin Rhodes, Supervisors of Measuring and Weighing.

Facts as to Soil and Water

Area, five acres.
Soil, sandy silt loam.
Depth of surface soil, about 12 feet.
Depth of water table, from 6 to 12 feet.
Irrigation, none.
Variety, Chilian Alfalfa.
Stand four years old, 1920.
Official moisture content 12½ per cent.

The average rainfall in Chino is 15.63 inches and last year there was only 10.00 inches from July, 1918, to July, 1919, and 3.28 inches since that time or only 13.28 inches in the eighteen months before the close of the contest.

OLD FOLKS

We suppose it is because we meet so many old folks and also because there are so many of them we like that we find ourselves constantly making a study of them.

And as we think the whole thing over we feel that there is just one thing that we would like to see old folks do, and that is to keep their minds young.

When we are old it may well be that we cannot hope to escape the physical infirmities that come with age. Certainly we cannot hope to dance as well as we did when we were young. Nor can we hope to run as fast, to jump as high, or to do a lot of other things that we used to do. But there is nothing to prevent us from keeping our minds young.

The trouble is that when we are old and can no longer step lively and play baseball and shinny, and dance, we permit ourselves to dwell upon the fact. And invariably then we hark back to the time when our legs were limber and our shoulders were straight. And we are eternally talking and thinking of those times.

It is a grave mistake for us to do it. While it is all very well for us to keep tender memories of the past, the joys that once were ours, and the gladness we used to know, it is a mistake to get into a rut like that.

If, on the contrary, we fasten our interests on the things of the hour; if we go to the baseball games even though we can no longer take a hand in them, and hunt up the places where the dances are going on, even though we can no longer trip a toe in them—why, then, don't you see that we are still in it all and as happy as ever.

Darn it all, old folks, don't let the mopes get hold of you.—L. A. Times.

FUNDAMENTALS OF SUCCESSFUL POTATO GROWING

By G. H. Hecke, Director, State Department of Agriculture

Practically the only way to know that your seed stock is good is to know that the fields from which this stock was obtained have been inspected. Plant the variety best adapted for your locality and purpose, that is, whether for late or early harvest. Use solid, ungerminated stock if possible to obtain it. The locality in which the seed was grown is also important. Treat your seed with corrosive sublimate, four ounces to 30 gallons of water. Soak one-half hour. This solution is poisonous and should be handled accordingly, but it is better than formalin for all skin diseases of the potato. Use a wooden container for this solution.

Do not be niggardly of your seed. Remember, the larger the seed piece the greater the crop.

Plow deep and pulverize soil thoroughly. Conserve moisture by shallow surface cultivation. The best part of potato cultivation is done before planting.

Cultivate frequently and where the tuber moth is troublesome keep the potatoes well hilled up and the soil finely pulverized. The tuber moth seldom injures potatoes in the ground if they are covered continuously with a dust mulch.

Irrigate so that the plants will have a continuous supply of moisture. Continuous moisture is more important than a large amount given at irregular intervals.

For growing potatoes on a small scale without irrigation, covering the ground with a straw mulch after planting will conserve moisture, keep the soil cool and produce a much larger and better crop.

Pajaro Valley had a larger output of dried apples last season than any preceding year. 3,000 tons of dried were shipped out of Watsonville.

FOREST FIRE DAMAGE IN CALIFORNIA GREAT

"The report circulated by Secretary Rhoades of the California Forest Protective Association that there were only 19,000 acres of lands in private ownership burned by last year's forest fires for the entire state of California is incomplete and misleading,' says District Forester Paul G. Redington.

"It is unfortunate," he continued, "that such incomplete figures should have been given to the press, particularly at a time when the public is so vitally concerned in the shortage of water, the unprecedented high prices of lumber and the very serious situation in regard to our supply of wood pulp for news print. With such conditions actually upon us, the public has a right to the knowledge of the real damage done by forest fires in California.

"While Hr. Rhoades is correct in his statement that approximately 59,755 acres of timber lands were burned over within the national forests (a figure taken, undoubtedly, from the carefully compiled data secured by our 250 field men), he neglects to add that over 23,000 of these acres were privately owned. This, with the 15,506 acres of private timber lands burned by forest fires outside the national forests, as reported by State Forester G. M. Homans, amounts to over 38,000 acres—more than the area of government timber lands swept by fire and just about double the figures given by Rhoades."

Nearly 56,000,000 feet of timber, worth some $132,000, was the toll exacted by the more than 1,100 fires within the national forests in this state last year, according to Redington, and this in spite of the fact that 880 of the 1,100 fires discovered and fought by forest rangers were kept to less than ten acres each. The Shasta forest in Siskiyou and Shasta Counties suffered severely, with a total of more than 28,500 acres burned, over 12,000 of which was in private ownership. Actual damage to timber was also greatest on the Shasta, for fires here destroyed $34,000 worth of government and $42,000 worth of private stumpage.

The largest burned acreages, according to forest officials, were in the brush country of the Angeles and Santa Barbara forests in Southern California, where over 200 square miles of mountain watersheds were denuded of their vegetation.

That forest and brush cover act as a deterrent to erosion and help prevent premature runoff of melting snow and early rains has, as a result of these enormous burns, been most strikingly demonstrated by the effects following the burns on these southern forests, where heavy erosion is already in evidence and the runoff has been greater during the short elapsing period than has ever been known in the locality before.

Mr. Redington says: "Protection from fire of our mountain watersheds is an imperative duty devolving alike upon the nation, the state and the individual, and it is fully as important as are many of the other splendidly conceived measures now being advocated to help meet the coming water shortage in California.

"Fire protection as afforded by the forest service in California has been by no means perfect. Naturally, for like all large organizations, ours suffered severely both during and after the war—suffered most, as a matter of fact, in those localities where we later had the worst fires. But we are rapidly building up our personnel again and I feel confident that the season of 1920 will find us in better shape, provided the public will cooperate by being careful with fire, than have the past few years. Fire exclusion will be rigidly and impartially enforced on all the national forests in California this year."

Fires outside the national forests destroyed timber and range worth, according to State Forester Homans, more than $386,000. This figure does not include damage to grain and hay, which totaled over $350,000, nor to improvements valued at nearly $190,000. The season of 1919 was considered the worst in California since 1910.

RICKARDS REPORTS ON GRAIN

In a report just issued by J. E. Rickards, field agent, bureau of crop estimates, the reserve stocks of corn in the hands of farmers in California are estimated at ten per cent of the 1919 production, or approximately 287,000 bushels, compared to 506,000 bushels March, 1919, and 360,000 bushels in 1918. Ninety per cent of last year's corn crop was of merchantable quality, compared to 87 per cent one year ago, and the estimated percentage of the crop which is shipped out of the county where grown was 20 per cent, compared to a ten year average of 19 per cent.

Wheat—The reserve stocks of wheat are estimated at seven per cent of the 1919 crop, or approximately 1,143,000 bushels, compared to 531,000 bushels one year ago and 520,000 bushels two years ago. Fifty-eight per cent of the crop grown in the state is estimated to be shipped out of the county where grown, in comparison with a ten year average of 57 per cent.

Oats—The reserve stocks of oats in the hands of farmers are estimated to be seven per cent of last year's crop, or about 368,000 bushels, compared to 728,000 bushels in 1919 and 686,000 bushels in 1918. The percentage of the crop shipped out of the county where grown is about 35 per cent, compared to a ten year average of 43 per cent.

Barley—Estimated reserve stocks of barley in the hands of farmers are eight per cent of the 1919 crop, or approximately 2,400,000 bushels, compared to 6,864,000 bushels one year ago and 4,698,000 bushels two years ago. Fifty-five per cent of the 1919 crop was shipped out of the county where grown, compared to a ten year average of 51 per cent.

The state water commissioner of Arizona has during the past year granted 31 applications for water diversion rights and ten applications for impounding permits. Several of the latter projects involve expenditure of millions of dollars.

Sweet Clover

By F. W. Waite

SOME of the biggest improvements in agriculture come about very slowly and by the time the farmers as a whole become acquainted with them have grown to very large and important industries. Plants that were formerly thought to be of very little value have suddenly sprung in a period of a year or two from small isolated plantings to large acreage over the entire country.

Probably no plant has attained the importance of sweet clover (Melilotus Alba). While the East has long known its value, not only as a forage and a hay crop but as a soil improver, it is only recently that the West has begun to utilize its many advantages over the plants they have been using for the same work.

We are, however, interested mostly in its power to grow and produce large crops under the most unfavorable circumstances. While it is not likely that it will ever displace alfalfa as the principal hay and forage crop of California, it is interesting to know that planted crops on cultivated land have increased from a few acres in 1917 to more than 50,000 in 1920. It is now being grown on land that is too hard and compact to grow alfalfa, land too sandy, too dry, too wet or alkali for not only alfalfa but other profitable forage crops. On the better lands it carries more stock than it is possible to run on alfalfa, and under equal conditions will produce much more hay each year.

In feeding value it ranks very high. Alfalfa contains 49.69 pounds of total digestible protein, carbohydrates and fats to each 100 pounds of dry hay, while sweet clover contains 49.17 pounds per 100. However, under identical field conditions the sweet clover will in the majority of cases increase the butter fat content of milk and will gin to figure in crops of several tons. Sweet clover will in the same time make a much larger root growth; in fact, in the first year it will generally have a larger root than alfalfa six or seven years old. Fields have been noted in different parts of California where the root will have a diameter of from one to two inches at a depth of two and three feet. This root is, however, much softer than the alfalfa root and will decay inside of six weeks after plowing. This large, quick rotting root system is a big factor in soil reclamation, as it not only opens up the most refractory soils but leaves the root channels filled with organic matter for the free circulation of air and water in the soil, thus accomplishing root tillage that not only reaches below the depth possible to obtain with any tools, but thoroughly acrates these soils, establishes a drainage in the case of alkali soils and crcates an immense water holding capacity.

A Husky Melilotus Plant

A summer's growth without irrigation on place of J. C. Huffaker. Photo by Waite.

Melilotus Fields in Imperial Valley

Upper picture on ranch of J. A. Bain, showing the magnificient pasturage afforded by melilotus. Lower photo shows scene on the ranch of J. C. Huffaker taken before planting of sweet clover. The white spots are of white alkali. Notwithstanding this alkali heavy crop of sweet clover is now growing on the land. Photos taken by F. W. Waite of El Centro.

Due to these points, one year of sweet clover, where it is properly inoculated, will show greater gains in the crop following than three years of alfalfa. As a green manure and rotation its equal has never been found. The thousands of acres that are now being planted by the big sugar companies in Southern California show more than anything else its value as a fertilizing plant.

Imperial County had several plantings of the sweet clover made in the condition beef cattle, hogs and sheep quicker and produce a better grade of meat than alfalfa. It has the added advantage of not bloating even sheep when pastured under the most trying conditions.

Figures from the Utah experiment station show growth of 7,700 pounds per acre of sweet clover under dry farming conditions, while alfalfa produced but 2,860 pounds. This is explained by studying water requirements of the two plants. Alfalfa needs 1,068 pounds of water to produce each pound of hay, while sweet clover requires only 709 pounds. This gain soon amounts to a great deal when we be-

spring of 1919 under wide range of conditions.

J. C. Huffaker made a small planting that had absolutely no care or irrigation during the year, but which has proven so successful that this year his plantings will cover more than 60 acres on a 90 acre ranch. He was able to begin pasturing within six weeks from the time of planting.

J. A. Bain, east of El Centro, also made a small planting in the spring of 1919. This clover made a 40 inch growth in 90 days from the time of planting. A planting made December 15, 1919, of ten pounds of sweet clover with 35 pounds of wheat to the acre has carried seven head of cows on less than two acres of ground from January 15 to February 15, 1920. He has stopped pasturing and will harvest a crop of wheat for grain and then use the clover for pasture again during the summer, plowing under the growth in the fall for fertilizer.

Both of these plantings were made on land that was not producing or had made very poor crops heretofore. Other men have the same story to tell and in a short time Imperial, being as it is a large cattle feeding section, will be utilizing the Melilotus Alba more and more. A large acreage that has been planted this year will be used to grow a seed crop the second year (the Alba being a biennial, making seed and dying at the end of its second year's growth), and owing to the price of seed and the large yield, the seed will bring in more than the price of the land per acre outside of the feed obtained during the other 18 months of the clover's growth.

EELWORM AND POTATOES

The most serious phase of the eelworm problem arises through the distribution of diseased potatoes. In this respect California is in rather a peculiar situation. Throughout most of the state the farmers do not grow enough potatoes for their own use. They usually have a small patch, the product of which lasts but a short time. Even if they grow them in large enough quantity for market purposes, the lack of proper storage facilities prevents their holding over a sufficient stock for house use throughout the year. Therefore, during a considerable portion of the year they purchase their potatoes in the open market. Evidently, then, if a large potato producing section of the state or adjoining states ships potatoes infested with eelworms throughout the state there is great danger of valuable farming land becoming infested through the unrestricted distribution of potatoes carrying this pest. The housewife, when preparing these potatoes for the table, pares them and throws the refuse out to the stock or on the manure pile in the corral, and from there they are spread over the fields. If any of the potatoes used on the ranch, therefore, are infested with eelworms, a portion of the worms at least are very liable to be spread over the ranches of the state. When we consider how serious the pest is on many of our agricultural crops, such as tomatoes, cantaloupes, lettuce, beans, peas, etc., when the soil becomes infested, the injury which may arise through the shipment of infested potatoes can be somewhat appreciated. There has come to the writer's knowledge an instance where a farmer discovered eelworms in the potatoes he grew on his ranch and investigation showed conclusively that the only way infestation could have been brought about was through the fact that he had been getting potato parings and other garbage from a hotel in a nearby town for his cows. In this way he unwittingly stocked his land with a serious pest. Not only is there danger of clean land becoming infested through potato parings, but ranchers often use so-called table potatoes for seed purposes and in this way the eelworm is actually planted in the soil.

The eelworm is not generally distributed over the state. Probably it is not found at all in many counties or only in very restricted areas. It is highly important, then, that potatoes affected with this disease be rigidly prevented from distribution. The easiest way to prevent their distribution is to prevent the production of potatoes infested with these worms. This means planting only disease free seed on disease free land.—W. V. S.

Alfalfa On Irrigated Land

The greater portion of California's alfalfa production is on irrigated farms. There are, however, thousands of acres yielding two or three crops and sometimes a half dozen of them on non-irrigated lands. Above scene was taken in Imperial Valley on lands which were absolute desert a little more than a score of years ago.

Don't feed 'em!

Rats are non-producers.

So are squirrels and gophers and mice.

"They spin not, neither do they toil," but they certainly do eat.

And the trouble is they all eat "off" of you.

That is, they do unless you handle your grain in bulk.

Support less rats and rodents. You don't owe them anything. They have never done anything for you—except make damage.

The Calco Metal Grain Bin, for storing your grain in bulk, cheats the rats and other four-legged, grain-eating beasts. It enables you to market your entire crop—none of it goes for free lunches.

MODEL 100

Calco Automatic Drainage Gate

To be used where drainage is necessary. Requires no care or attention. Comes with the necessary length of Armco corrugated Iron pipe. Whole structure shipped ready for installation upon arrival. Send for list of sizes and prices.

MODEL 254

Calco Adjustable Irrigation Dam

A simple, effective device for holding water and backing it up any desired distance. May be adjusted to any size ditch. Controls the flow of water. Ask about it.

MODEL 153

Lateral Headgate

An inlet gate intended for use under varying heads of water up to six feet. Light in weight. Quickly installed and easily moved. Cast-iron hand wheel and full lathe cut threads on lifting rod makes operation of slide rapid and easy.

MODEL 161

Armco American Ingot Iron Irrigation Gate

An irrigation gate that never swells and sticks or warps out of shape. Easy to install, easy to operate, and can be moved at will. Made of Armco American Ingot Iron, they give satisfaction for years. Send for descriptive folder.

Lyman Irrigation Meter

(Not Pictured)

Makes possible the accurate measurement of irrigation water. It does away with the guess work of the old method with one or two measurements a day. Can be installed by any one in a few minutes. Send for illustrated pamphlet.

Lactein

Condensed

Buttermilk

IS REAL

CHICK FOOD

INVESTMENT

It is the food and tonic combined that will produce the greatest return to you.

It Nourishes Chicks Properly

It Saves Them From Disease

—because it supplies just the scientifically correct amount of Lactic Acid, the only absolute protection for the delicate baby chick.

—LACTEIN condensed BUTTERMILK is a food and tonic of the highest order—not an experiment, but a PROVEN FACT that it produces the best results.

—Chicks especially thrive on it, because it supplies the cure and preventative for the ills and destructive forces—not only acts as a tonic and purifier, BUT SUPPLIES THE ELEMENT OF FOOD THAT MAKES CHICKS GROW!

Profit by the experience of the largest poultry raisers, and YOU, TOO, FEED YOUR CHICKS LACTEIN CONDENSED BUTTERMILK.

Easy to handle; cannot sour; most economical.

Turkeys on the Farm

By Jean A. Koethen

(This is the first of three articles on the rearing of turkeys. The second will deal with feeding and the third with protection from various enemies.)

IN the spring after the hatching of the chicks is well out of the way and the young stock in the weaning coop, the thoughts of the farm woman turn to turkeys. No other crop is quite so profitable, if only the crop can be raised. Last winter the retail price was around 60 cents a pound, with a demand that could not be supplied. The year before it was nearly as high, and there is no reason for expecting lower prices next year. If every farm woman in Southern California should raise a dozen turkeys for the market this year the demand would still not be supplied.

A government bulletin which lies before me (Farmers' Bulletin 791) states that the number of turkeys in the United States decreased in the ten years from 1900 to 1910 from 6,594,695 to 3,688,708, and that it is still "going down," and explains this decrease by the further statement that "the high mortality among young poults, as ordinarily cared for on the farm, the outbreaks of disease, particularly of blackhead, among the turkeys in certain sections of the country, together with serious losses resulting from the presence of predatory animals in other sections, have tended greatly to discourage the turkey industry." This certainly looks discouraging, but the next paragraph raises our hopes again:

"For those who are favorably situated for raising turkeys a more profitable side line can hardly be found. Given plenty of range, turkeys will readily find grasshoppers and other insects, green vegetation, the seeds of weeds and grasses, waste grain and acorns and nuts of various kinds. In this way the cost of raising them is very small and the profit large. Grain and stock farms are particularly well adapted for turkey raising, and it is on such places that most of the turkeys are found. Plenty of range is essential to success in turkey raising. Little has ever been done in the way of raising turkeys in confinement, and when it has been tried the results have been discouraging."

The Ideal Turkey Range

I am not sure that that last sentence is true in California. A good many people do meet with fair success raising turkeys in confinement, though they lose a good many poults. The fact is, range in California is not what it is in the East. If the birds can be kept on alfalfa, as they are in Imperial Valley, well and good. If they are forced to range in the vegetable garden, results are discouraging for the garden. If their only range is dry hillsides, they will not find sufficient insect life or green feed to supply their needs and must be fed almost as if in confinement. Extension Bulletin No. 2 of the Rhode Island station describes the ideal turkey range as "a high, open and somewhat rolling pasture land, bordered on one side at least by woods and having a thin overgrowth of grass, with brush and brier patches along the walls. The soil should be light and well drained, and the area should by preference have a southerly slope. A few low-branched trees, for roosting purposes and shade, and a brook or spring add value. On the whole, better results can be obtained on a small fenced range, not far from the house, than on an unlimited range extending to remote districts. A fenced range consisting of about six acres of field or pasture devoted exclusively to the birds is sufficiently large for the raising of about 100 poults to the age of six months."

Several seasons ago I visited a woman who was having unusual success with her turkeys, and she had raised about 60 on an acre and a half. She took care, however, to make this into real green range by planting grain and letting the cows nibble it off, so that there was always new, tender growth for the poults.

Avoid Inbreeding

Young breeding stock is preferred by most breeders. Early hatched turkeys are usually sufficiently mature for use the following year. Late hatched and slow growing birds should never be kept for breeders. Mate a vigorous, well grown cockerel to early hatched pullets or yearling hens. Yearling toms may be used, but their greater weight and clumsiness makes them less desirable than the younger birds. Older birds are likely to be overfat, with resulting infertility.

Fifteen hens may be safely mated to one vigorous tom. If a larger number of hens are kept, two toms should be used. Some breeders prefer to use two toms with 15 hens in order to insure fertility. When two are used the best practice is to run one with the hens one day and the other the next.

Inbreeding with turkeys is nearly always disastrous and should be carefully avoided. When hatching eggs are purchased make sure that they are laid by hens mated to an unrelated tom. Inbreeding weakens the constitution and makes the young birds, which are delicate at the best, liable to any and every disease. It is quite probable that the decline of the turkey industry is due very largely to inbreeding. The turkey is still too wild in its nature to survive the careless breeding to which chickens have become accustomed.

Feed Breeders Carefully

"Good breeding condition," says Circular 791, "means being well fleshed but not fat. Given free range where there is ample supply of natural feed during the winter and early spring, such as is usually the case in the southern portion of the United States, a good daily feed of grain, preferably oats or wheat, is sufficient to keep the birds in good condition. The natural feed of turkeys at this time of the year consists largely of grass, tender buds, young leaves, insects, and nuts and seeds of various kinds. During the winter northern turkey raisers usually feed twice a day on equal parts of oats, wheat and corn, with vegetables such as potatoes, turnips, beets and cabbage as a substitute for green feed. Free access to grit, charcoal and shell forming material, such as oyster shell, is necessary throughout the breeding and laying season.

Setting the Hen

Turkey eggs may be hatched by turkey hens, by chicken hens, or by incubators. Opinion is divided as to which makes the better mother—a turkey or a chicken hen. The Rhode Island station prefers chicken hens because they are more devoted mothers, in spite of the fact that their very devotion leads them to overfeed the poults if they have a chance. Many breeders prefer to set the first clutch of eggs under a chicken hen and break up the turkey hen when she goes broody so that she will lay another clutch. The average number of eggs in the first clutch is about 18, in the second about 12 and in the third about ten, though there is considerable variation in egg production of different hens. The turkey hen may be set on the second clutch or broken up again and set on the third. A chicken hen can cover from eight to ten turkey eggs, a turkey hen from 15 to 18.

Turkey hens are always set on the ground, and chicken hens should be, if possible. The nest is hollowed out just enough to prevent the eggs rolling out and covered with a thin layer of straw. Over the nest is set a roomy coop to keep the hen from being disturbed and to protect her from sun and rain. Turkey hens do not ordinarily come off for feed and water more than once in two or three days, but should be allowed to come off when they wish. If a hen does not come off herself, she should be taken off every day or so. Whole corn, fresh water and grit should be always accessible.

Whether the sitter is a turkey or a chicken hen, she should be well dusted for lice before she is placed on the nest and once a week for the first three weeks of incubation. Turkey eggs require 28 days for incubation. The ground about the nest should be sprinkled occasionally in dry weather,

and the eggs may be sprinkled on the twenty-fourth day. After that the incubator should be kept closed and the hen left to herself.

Breeds of Turkeys

Six varieties of domestic turkeys are recognized by the American Standard of Perfection: the Bronze, White Holland, Bourbon Red, Black, Narragansett, and Slate. Their popularity is in the order in which they are named, that of the Bronze far exceeding all the rest. The White Holland is much liked by those who prefer a medium sized turkey and the Bourbon Red is popular in some localities. Wild turkeys are still found in unsettled portions of the United States, especially in the mountains of Texas, and are in great demand for improving the vigor of the domestic birds.

Poultry Queries

Conducted by J. A. Koethen

Inbreeding Turkeys

Will you kindly tell me in the columns of your valuable paper whether inbreeding in turkeys would cause club feet and a predisposition to disease.—Subscriber, Jenner.

The direct result of inbreeding is a weakened constitution in the next generation, and a weak constitution, or lack of vigor as it is termed in the feathered tribes, predisposes to all kinds of diseases. Whether inbreeding could produce club feet would depend on whether there were club feet among the parent stock. Inbreeding intensifies any weakness or imperfection, but I do not see how it could produce club feet unless there were club feet already in the ancestry. The principles of breeding require the use of the most perfect specimens of their kind as parents, whatever the kind may be, and imperfection in one parent must be offset by perfection in the other as regards any given point. The turkey degenerates so quickly when inbred that inbreeding is never practiced by scientific breeders.

Fatty Degeneration of Liver

In several chickens we have killed we find the liver almost white. What is the cause?—Subscriber, Perris.

Your chickens have either fatty degeneration or atrophy (wasting) of the liver, due probably to lack of variety in the feed, and perhaps also to lack of sufficient green feed. Let them have a mash containing several kinds of ground grain and protein feeds, such as the following, which is recommended by the poultry department of the University of California: 5 pounds bran, 5 pounds shorts or low grade flour, 3 pounds meat scrap, 2 pounds soy bean meal, 5 pounds ground barley, ½ pound charcoal, 1/10 pound salt. Give them as much range as possible, and all the greens they will eat. A dose of Epsom salts once a week (½ teaspoonful for each bird, mixed in moist mash) or 1 to 2 grains bicarbonate of soda daily for each bird in the drinking water may be given to improve the digestion.

Coccidiosis

I was brooding about 1,300 chicks when they were four weeks old. All seemed to go well up to this time except the two or three days previous when they seemed somewhat languid and their combs were not quite as red and there was just a slight indication in the droppings that a few of the birds might develop coccidiosis. This was noticed on Friday 27. The following day 45 died; the next, 180, and the following about 250, and today 40. They all seemed to suffer intensely and would go into convulsions and finally draw their heads far back at the time of death. These chicks had been fed a commercial chick scratch twice a day, morning and night, and were getting about three gallons a day at this time and fed a dry mash consisting of one-half bran and one-half of egg mash at 9:30 and 12:30. They were given lactein altogether as a drink and at this age were getting about a 2½ to three per cent solution. On Friday on account of the evidence of a little cold of a few and their droopy condition they were given permanganate of potash to drink. Then on Saturday on account of the evidence of coccidiosis I gave them a ten per cent solution of lactein. While we have checked the ravages of the disease by the use of a prescription from a local feed man we are wholly at a loss to know what has caused our trouble, hence do not know what to do to avoid a repetition of same. When opened it was found that the entire intestine was inflamed and in some instances the liver was a little dark and the gall so green as to discolor the organs adjoining. My first conclusion was that they had been poisoned by the combination of the permanganate and the lactein. But this theory has been exploded as a neighbor has lost 150 or more in the same way and he had not used permanganate at all and fed the lactein intermittently. All feed given by me had been taken from the same lot from which I had been getting my supply for the previous ten days or two weeks.—Subscriber, Van Nuys.

Dr. Salmon says coccidia are parasitic organisms of microscopic size and "are brought on the premises with birds or with eggs for hatching obtained from infected flocks or by pigeons flying from place to place." I doubt if even the experts fully understand the causes of the disease, but there seems to be only one cure, that is, buttermilk or sour milk. Circular 162 of the University of California, which should be in the hands of every poultryman, says: "Feed a small amount of grain night and morning. Feed mash during the middle of the day, never leaving it before the chicks longer than two hours. Feed greens as usual. Keep buttermilk in fountains constantly before the chicks." If care is taken to give only a little feed, other than the buttermilk, improvement will be noticed in three or four days and all signs of the disease will have disappeared in from two to four weeks. Chicks should be put on new ground if possible and all dishes and utensils kept scrupulously clean.

White Leghorns

Are the S. C. White Leghorns a pure breed of birds? After being trap nested a few years and showing any other color, are they pure?—E.

There is said to be a considerable intermixture of Minorca blood in many of our California White Leghorns. If black appears in the white plumage it can usually be explained as a "throwing back" to the Minorca strain. If any other color appears it would cer-

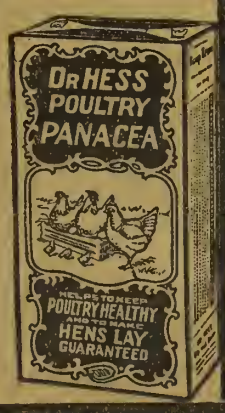
How Many Will You Raise?

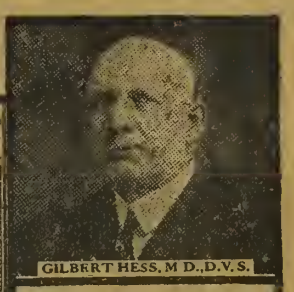
The loss in little chicks that die the first few weeks after hatching amounts to millions of dollars each year. Everybody must cut down the losses and increase production to the limit this season. How many chicks do you lose from *Gapes? Diarrhoea? Indigestion? Leg Weakness? Weakness from Rapid Growth of Feathers?* Prepare them to withstand little chick ailments by feeding

Dr. Hess Poultry Pan-a-ce-a

Remember that disease takes the weaklings—not the strong and healthy. And remember that indigestion is at the bottom of many little chick ailments.

Pan-a-ce-a prevents and cures gapes.
Pan-a-ce-a prevents and cures leg weakness.
Pan-a-ce-a regulates the bowels.
Pan-a-ce-a produces appetite; it promotes digestion.





Dr. Hess Stock Tonic
Keeps Pigs Healthy and Thrifty. Drives out the Worms.

And remember good digestion is most essential during the rapid growth of feathers. A Pan-a-ce-a chick will outfeather a non-Pan-a-ce-a chick every time.

Your dealer is authorized to supply you with enough Pan-a-ce-a for your whole flock, with the understanding that it's to prevent and cure *Gapes, Indigestion, Diarrhoea, Leg Weakness;* that you are to see marked results during the growth of feathers; otherwise, he will refund every cent you have paid. 30c, 60c and $1.25 packages. 25-lb. pail, $3.50; 100-lb. drum, $12.00. Except in Canada.

Own a "Selected" Farm in Western Canada

Make Bigger Profits!

THE most wonderful opportunity in the world for Business Farmers is in the "SELECTED" FARMS which can be bought for $15 to $40 an acre along the lines of the Canadian National Railways in Western Canada.

"Selected" Farms

These "SELECTED" Farms are carefully chosen from the cream of the richest wheat and cattle country in America, to meet your special needs, on the advice of experts representing 14,000 miles of railway, whose assistance, though free to home seekers, is of great practical value.

A Cordial Welcome

Western Canada extends a helpful hand to home seekers. Friendly neighbors, with the same customs and language—splendid schools, churches and social life—every benefit that you formerly enjoyed and many advantages that you could not get from higher priced land elsewhere—warm, sunny, growing summers and dry, cold, healthy winters—await you in this wonderfully prosperous "LAST WEST."

Taxes Are Low

Western Canada taxes fall lightly on the farmer. A small tax on land, but buildings, improvements, animals, machinery and personal property are all tax exempt.

Big Profits in Wheat and Dairying

Western Canada is famous for its big wheat yields. "SELECTED" FARMS along the lines of the Canadian National Railways average more than 20 bushels of wheat to the acre. Under specially favorable conditions a yield of 50 to 60 bushels per acre is not uncommon.

Dairying is exceptionally profitable. That soil and climate are well adapted to it is shown in greatly increased production and high quality maintained. A world-wide market awaits all that Western Canada can produce.

Fortunes from Beef and Dairy Cattle

Western Canada, the Cattle Man's Paradise! Beef and dairy cattle yield great profits. Stock thrive on the prairie grasses, which in many cases cure standing and make fine hay. Cattle and horses require only natural shelter most of the weather, and bring high prices without grain feeding.

Easy Terms

Terms on "SELECTED" Farms: About 10 per cent cash down, balance in equal payments over a term of years; interest *usually* 6 per cent.

Special Rates to Home Seekers

Special railway rates will be made for home seekers and their effects to encourage personal inspection of the Farms along the lines of the Canadian National Railways. Rates and full information will be sent free on request. ***Write or mail coupon TODAY!***

tainly indicate a cross of some sort, for the White Leghorn has been bred for many years and is unquestionably a pure breed.

Imitation Worms

An Orange reader, Mrs. Geo. E. Osmun, writes: We were much interested in your remarks on page 414 in March 6 Cultivator. Your system is as near that which we have used for several years as may be in case of two parties who have never met nor corresponded. We do not dig the worms—have not time nor strength—but get a little liver, put some on a board with plenty of carpet tacks, hang board up on side of coop and let them go to it. Later get some tougher meat, cut in pieces and watch the tugs of war. Our hatch this year was 96 chicks from 114 tested eggs. Three died, balance are a week old today. We enjoy your remarks from time to time—don't always agree, but—.

New ideas are always appreciated in this column. That is what we are here for. There are as many methods of raising chicks, I verily believe, as there are folks who raise them, and no "best method." Keep them clean and warm and interested, give all possible exercise, feed an abundance of wholesome food, don't let them crowd at night. There you have it in a nutshell. As to the worms, I must admit my time and strength did not last and I had to fall back on beef scrap.

Rheumatism

Two months ago R. I. Red hen's leg swelled from knee to toes. It looks inflamed and is almost a third larger than natural size. It does not seem to be sore to the touch. We tried two kinds of healing salve on it, but could see no benefit. She eats well, is lively, has laid some since affected. The only thing wrong otherwise is one eyelid somewhat swollen. A few days ago we noticed the other leg beginning the same way. We then painted them both with iodine, which does seem to improve them a little, but not much. Will you please tell us what the trouble is and what to do for it?—Subscriber, Lindsay.

Dampness in house or run or exposure to rain or wind is responsible for rheumatism, which is undoubtedly what ails your hen, and the cause must be removed before you can hope for a cure. Put the affected bird in a warm, dry place and feed her mainly on greens and bulky food such as bran. Painting with tincture of iodine twice a day, very lightly, is the best external treatment. Give a dose of Epsom salts, 20 to 30 grains, followed the next day by common baking soda in the drinking water, a teaspoonful of soda to a quart of water. Bathing the legs with a liniment made of half a cup each of turpentine and vinegar with a heaping teaspoon of saltpeter added is sometimes recommended, but the disease is hard to cure and your main reliance must be on improved environment.

Standard for R. I. Reds

Can you tell me the markings and different points of the dark Rhode Island Red roosters and hens; also what would be a fair price for them? —Subscriber, Santa Barbara.

Standard weights for Rhode Island Reds are as follows: Cock, 8½ pounds; cockerel, 7½ pounds; hen 6½ pounds; pullet, 5 pounds. Disqualifications are: Positive enamel white covering more than one-fourth of earlobes; one or more entirely white feathers showing in outer plumage; shanks and feet other than yellow or reddish horn. It is impossible for me to give here all the points, which cover nearly four pages in the 1915 Standard of Perfection, but in general they are: Color: General surface, rich, brilliant red, except the primary wing feathers and primary coverts, which are black edged with red, the secondaries, which are part red and part black, and the tail, which is different in male and female. In the male the main tail is black, sickle feathers black or greenish black; coverts, mainly black, red as they approach the saddle. In the female the tail is black, but the two top feathers may be edged with red. Shape: In both male and female the head is medium size, carried horizontally and slightly forward; beak, medium length, slightly curved; eyes, large, oval, and in the male, prominent; comb, single, medium in size, set firmly on head, perfectly straight and upright, with five even and well defined points, those in front and rear smaller than those in center. In the male it is of considerable breadth where it joins the head, blade, smooth, inclining slightly downward but not following too closely the shape of the head. Neck: Medium length, in both male and female. In the male the hackle is abundant, flowing over shoulders, not too closely feathered. Back: Broad, long, carried horizontally. In the male there is a slight concave sweep to tail, and saddle feathers are of medium length and abundant. Wings: Of good size, well folded, carried horizontally in the male and nearly horizontally in the female. The fronts, in the female, are well covered by the breast feathers. Breast: Deep, full, well rounded. Body and fluff: In both male and female the body is broad, deep, long, straight, extending well forward, giving body an oblong appearance; feathers, carried close to the body; fluff, moderately full. Tail: Male, of medium length, well spread, carried at an angle of 40 degrees, thus increasing apparent length of fowl; sickles, of medium length, extending slightly beyond main tail feathers; smaller sickles and tail coverts, of medium length, well covered with soft feathers. Tail, female, medium length, moderately spread, carried at an angle of 35 degrees. Shanks and toes in the male; shanks of medium length, well rounded, smooth, set well apart; toes of medium length, straight, well spread. Legs and toes in the female: Thighs of medium length, well covered with soft feathers; shanks of medium length, well rounded, smooth; toes, of medium length, strong, straight, well spread.

What is a fair price for fancy stock depends entirely on how many ribbons it has taken. I know of a cock that sold for $75, and there are many higher priced. A blue ribbon bird ought to be worth $25, but it depends on what the competition was in the show where it took the ribbon. Where there is no competition a blue is not worth very much. Most breeders are glad to get $10 for anything but an exceptional bird. If you have no ribbons do not expect a fancy price for your stock.

W. L. Cockerel

Please tell me how old a cock should be before he is used for breeding purposes, if he is a White Leghorn.—Subscriber, Hemet.

A White Leghorn cockerel hatched in early spring should be ready for breeding in the fall. I have had good fertility from a Rhode Island Red at eight months or even a little younger, but it is better not to use a bird for breeding till he is nine months old.

Raising Chicks and Turkeys

Kindly let me know where I can get instructions for raising turkeys and baby chicks.—Subscriber, Santa Monica.

Circular No. 99, published by our own agricultural experiment station at

Berkeley, contains full directions for raising chicks in a brooder and also with hens. I presume it can still be had on request. There is also a very good bulletin (No. 2) of the Connecticut Agricultural College at Storrs, and another (Circular 17) of the Iowa station at Ames, which have also been sent free to all applicants. I cannot say, of course, whether or not they are still in print. For a very helpful discussion of turkey problems write the Rhode Island Station at Kingston, R. I., for Extension Bulletin No. 2 on "The Rearing of Turkeys with Special Reference to the Blackhead Disease." Farmers' Bulletin 791 of the U. S. department of agriculture on "Turkey Raising" also contains a good deal of information. I am hoping to give next month in this department some of the methods of successful California turkey breeders.

NATIONAL EGG LAYING CONTEST

By T. W. Noland

The 300 contest hens at Mountain Grove, Missouri, laid 5,340 eggs during February, or an average of 17.8 eggs per bird. Pen 25, Barred Rocks, New York, won the cup by laying 120 eggs during the month.

Ten Leading Pens for February

Barred Rocks, New York, 120 eggs; S. C. Reds, Alabama, 118; S. C. Reds, Missouri, 116; Barred Rocks, Missouri, 109; S. C. Reds, Missouri, 109; R. I. Whites, Missouri, 109; S. C. White Leghorns, Illinois, 108; Anconas, Missouri, 107; Columbian Rocks, Missouri, 107; S. C. White Leghorns, Missouri, 106.

Ten Leading Pens to Date

S. C. Reds, Alabama, 435 eggs; Barred Rocks, New York, 426; S. C. White Leghorns, England, 410; S. C. Reds, Missouri, 410; White Wyandottes, Missouri, 406; Buff Orpingtons, Missouri, 406; Columbian Rocks, Missouri, 388; S. C. Reds, Missouri, 369; Barred Rocks, Canada, 356; Buff Orpingtons, Missouri, 353.

Five Leading Individuals to Date

Barred Rock, New York, 108 eggs; S. C. Red, Alabama, 103; S. C. Red, Alabama, 103; S. C. Red, Alabama, 103; S. C. Red, Missouri, 103.

Hens Laying 25 or More Eggs

One Barred Rock laid 26 eggs; three Barred Rocks laid 25 eggs; one White Wyandotte laid 26 eggs; one White Wyandotte laid 25 eggs; one S. C. Red laid 26 eggs; six S. C. Reds laid 25 eggs; one R. I. White laid 25 eggs; two Buff Orpingtons laid 26 eggs.

Sales value of eggs average bird for February, 72 cents; sales value of eggs average bird to date, $2.62; sales value of eggs best pen for February, $4.60; sales value of eggs best pen to date, $24.87; average price received for eggs during February, 46 cents per dozen.

USE OF BEST LAYERS TO HEAD BREEDING STOCK

The most certain method of improving the egg production through breeding is to use only males that are the sons of known high producers. Males from hens which have laid more than 200 eggs in one year are of special value in transmitting the high producing character to the pullets. Since the male furnishes half of the blood for the flock, much care should be used in choosing him. Farm poultry keepers can afford to pay a good price for a vigorous male from a heavy laying strain. Unfortunately, not nearly enough males from trap nested stock are available to supply the demand for such birds.

Where a pedigreed male cannot be obtained the next best plan is to choose from a good producing flock an outstanding, scrappy male with strong vitality. No proven method of picking out by physical tests has yet been perfected, but vitality and egg production are closely linked, and no male showing a weak constitution should be tolerated as a breeder. The strongest males can be easily detected by the marked evidences of masculinity, such as gallantry toward the hens, fearlessness in fighting and a persistent tendency to crow lustily. The boss of the hen yard is usually the best breeding male.

A well matured cockerel usually gives better breeding service than an older male, though good results can be obtained with strong yearling cocks. Many breeders use the same males to head the breeding flock for two successive years.

Where a valuable male is secured for the breeding flock it is desirable that he be mated to the maximum number of females. The number of hens that can safely be allotted to each male depends to a certain extent upon breed and vigor of the male. A strong, fully matured cockerel of medium weight breeds such as the Plymouth Rocks, Wyandottes and Rhode Island Reds can safely be mated with from 20 to 25 hens, while with the lighter breeds, such as Leghorns, one male will furnish good fertility when mated with from 25 to 40 hens.

MOVIES IN BABYLON

It sounds almost as contradictory as a snowstorm in August, but it's true. Wherever the British Tommy goes, the cinema must soon follow, and now that the British troops are established in the Near East, the moving picture theater has become a regular institution throughout the Mesopotamian cities. But what a strange turn of the wheel that Babylon, the city of perhaps the oldest civilization of the world—Babylon, which was ancient when Rome was founded, should now be applauding the movie stars.

It would be interesting to stand aside and watch the crowds that surge into that movie place—Jews, Persians, Arabs in all the splendor of their rich draperies, and riotous British soldiers.—Everyland.

NOT SO HARD TO UNDERSTAND

A teacher who believed in cooperating with the parents of her pupils called at the home of a small boy whom she had caught in a number of falsehoods in order to take counsel with his mother.

"I can't see how you can say that," the boy's mother objected. "John never tells me lies. I'm mighty particular about it myself. He's out in the yard now. Annie," she said to his small sister, "you go out and tell him to come right in this minute!"

Annie went, but in a few minutes she returned without the small prevaricator. "He won't come," she announced proudly. "He says he won't."

"Did you tell him who was here?" inquired his mother.

Annie shook her head.

"All right," said the truthful parent. "Go back and tell him his grandmother's here and has some candy for him. That'll bring him!"—Youth's Companion.

A considerable number of farmers in the Salt River Valley are contemplating the raising of broom corn the coming season. It has been demonstrated that this is one of the crops that may be produced successfully and with the present prices ranging from $50 to $400 per ton and two crops per season, some farmers believe that it will be fully as profitable as cotton.

The federal court has ruled that homestead lands within the Salt River Valley reclamation project upon which proof of residence has been accepted, but on which no final certificate of patent has issued, are taxable by the county.

It is reported that a company has been formed in Mohave County, Arizona, for the development of about 60,000 acres of land by irrigation. The plan calls for a dam on the Virgin River near Littlefield.

Yearling steers have been contracted for at $47.50 per head. Probably this is the record price in Arizona.

Make Your Tractor Absolutely Reliable

To be a profitable investment, your tractor must be dependable and economical—always ready to do a big day's work without coaxing or delay. And since these qualities are determined by the ignition, you should be sure to have your tractor equipt with a Bosch High Tension Magneto.

The sparks from a Bosch Magneto are so big and hot that, even though a lean mixture or low grade fuel be used, every bit of gas brought into the cylinders will be fired completely and instantly. That makes a powerful, smooth running engine, with absolutely no ignition worries and a low up-keep cost.

The nearest Bosch Service Station can add Bosch Dependability to your present tractor engine in a few hours time.

Watch for Moldy Grain

Many diseases of poultry are brought about by the feeding of grain that is moldy or smutty. The best known of these is aspergillosis, which is caused by the growth of the mold spores which have been taken into the throat and crop with the feed. Young chicks are especially susceptible to it. Dr. Salmon thus describes the course of the disease:

"When the air tubes or lungs are attacked the first symptoms are a slight catarrh with accelerated breathing. Soon the swellings obstruct the passage of air and there is a rattling or croupy sound heard chiefly during expiration. The affected birds mope, separate themselves from the remainder of the flock, or remain in a sitting posture; if made to move it is seen that they are weak and scarcely able to walk, and if they try to run they soon fall from exhaustion. The difficulty of breathing increases rapidly, they gasp for breath and make movements of the head and neck, as if choking; there is fever, diarrhoea, drooping wings, great depression, a tendency to sleep, and finally suffocation and death.

"When the disease is limited to the large air sacs the only symptoms are progressive loss of flesh and weakness. If the small air sacs of the bones are involved, which rarely occurs, there may be lameness, with swollen and inflamed joints. After death the yellowish nodules are sometimes found in the liver and kidneys as well as in the other organs which have been mentioned. The symptoms in brooder chicks are similar to those of white diarrhoea."

I. H. Severance of Cowell, commenting on the answer to a Willows subscriber in the Cultivator of February 14, says: "I saw a case much the same in Kings County, cause, mold in the Gyp corn and smut in the wheat. One hundred sacks of that wheat were taken to the grist mill and ten sacks of dirt were taken out of it. After that there were no more dead hens." In this case there were no such symptoms as have been described above. The hens were apparently in perfect health one day, went to roost with darkened combs that night and the next day were dead. The poison, whether mold or smut or both, worked rapidly.

The only cure for diseases due to mold is prevention. Once the spores have begun to grow, death is only a question of time. Keep your feed sweet and clean if you would avoid such troubles.—J. A. K.

Farm Bureau Egg Laying Contest

The third month of the contest at Santa Cruz ended on the night of February 15. For the month the flock as a whole laid 43 per cent, while the highest pen laid 70 per cent and the highest hen 90 per cent. The average consumption of feed per hen for the month was three pounds of mash and 3.38 pounds of grain. In addition to this the hens consumed approximately 3.5 pounds of greens per hen for the month. For the benefit of those who have inquired, below are given the feeds used and the method of feeding:

Dry mash: 50 pounds mill run, 15 pounds meat scrap, 50 pounds ground oats, 10 pounds linseed meal, 50 pounds middlings, 10 pounds soya bean meal, 15 pounds fish scrap, 5 pounds granulated charcoal, 1 pound fine salt. Grain mixture: Equal parts by weight of wheat, white Egyptian corn, whole barley, cracked Indian corn.

The dry mash is kept before the hens all the time, while at noon each day there is fed a moistened portion of this same mash at the rate of two pounds per 50 hens (dry weight). The grain is fed in a litter of straw at the rate of three pounds at night and two pounds in the morning per 50 hens.

Leading records up to the night of February 21, the end of the fourteenth week, are as follows:

High pens to date: Walls, 584 eggs; Neef, 517; Rose, 516; Enterprise Ranch, 503.

High hens to date: Walls, 86 eggs; Walls, 73; Hollis Peck, 73; Geo. Barker, 71; R. C. Gibson, 71; Enterprise Ranch, 71.

Highest pens for week: Bellows Bros., 53 eggs; Amsbaugh, 50; Wood, 48; Enterprise Poultry Ranch, 47; Rose, 45.

Hints for Rabbit Raisers

Answering request for information as to keeping and care of rabbits, A. C. Freeman writes:

"I take it that doe has been bred two weeks and that she has a hutch not smaller than ten square feet. Place a nest box in one corner of the hutch. In this cut a hole five inches wide and eight inches long, leaving about two or three inches at the bottom so the mother will not drag the little fellows out of the nest after nursing.

"During the two weeks before kindling keep the doe as quiet as possible and give her extra good care. Feed plenty of greens before and after kindling and sparingly a few days after the young are out of the nest, then plenty greens the rest of their lives. This will cheapen your feed bill and is one of the natural feeds for rabbits. We use the automatic hay rack system and keep alfalfa hay before them at all times. At night we feed a mash made of equal parts rolled barley, rolled oats and sour milk. Once a week season with table salt.

"Three days before the doe is to kindle put wheat straw into the nest box and also some in the hutch so she can arrange her nest to suit herself. A few hours before kindling she will line this with hair pulled from her body. At this time be sure to have a good supply of water in the hutch and there will be no danger of the doe eating the young.

"On the second day inspect the young and kill all but six, of course doing away with the smallest ones. This is one of the secrets of good rabbit culture. When the young are 15 days old clean out the nest and put in new clean straw. When they are five weeks old take the nest box out of the hutch, making more room for the little fellows.

"You can again breed the doe when the young are six weeks old and wean at seven weeks, giving the doe three weeks to herself. If the little fellows are to be raised for breeding stock better separate the sexes at this time but if for market this is not necessary.

"Never use a buck or doe under seven months of age and by all means use pure bred stock and you will have very little trouble raising rabbits.

"Now let me impress on your mind that rabbits must be fed regularly, the hutches kept clean and the stock kept from drafts. We find the self-cleaning hutches the best in the long run."

CLUB WORK HELPS BOYS WIN

Club work and club associations uts something into the blood of farmer boys that helps them win, say those familiar with the records of members. In Kent County, Delaware, the farm bureau last year adopted "1,000 members for 1920" as its slogan, and assigned to each neighborhood the number of members it was to obtain. Houston community was the first to exceed its quota of 40. It obtained a total membership of 51. The relationship of club work to this record lies in the fact that 26 of the members were obtained by one farm lad who began his club work in 1915. As a reward for his efforts this boy will have his expenses paid to attend the Delaware college short course. At the last state fair this club member's Holstein heifer won a blue ribbon, and out of 11 entries in the grain and vegetable section he captured ten first premiums, one third, and a state championship.

Household Department

BOOK FRIENDS

Good books are "really truly friends,"
They help us in our play,
They teach us how to live and work
And how to pass the day.

Companions they may always be
Whenever we're inclined,
And by the books we like to read
It's fair to judge our mind.

Some books have memories, oh so long—
They tell us of the time
When knights and ladies walked about
And often talked in rhyme.

They bring us friends we cannot lose
Who come to be so dear
That books who introduce such folks
We look for far and near.

So choose the books that help you live
To make your love more deep,
That after you have read them through
You're glad are yours to keep.
—Ethel R. Peyser in Everyland.

THE TWO PRETENDERS

(Continued from last week.)

By this time Victor was sitting bolt upright, listening as hard as he could. But there was a long pause.

Then the Interne went on. "When he told me that yarn about his mother—"

"That's nothing," Miss Jimmy interrupted, "I've written letters to her."

"The deuce you have!"

At that Victor flopped down and buried his face in the pillows and pulled the covers up over his head.

So Miss Jimmy had known it was a lie, and the Nicest Interne and everybody. His mind was in wild confusion. This old gentleman was his grandapa, and his own brave papa had been a liar. Worst of all, he himself had lied to his granpapa.

"If Jacques was here," he confided to his pillow, "He'd know what for me to do."

He lay there a long time trying to think. His pillow grew hot and wet, and in his mouth was the bitter salty taste of tears. In his heart one definite desire was shaping itself—to escape from them all and to go back to Jacques, for this about his grandpapa concerned Jacques, too. And Jacques never told lies. At last the awful thought came to him that perhaps it was morning already, morning when his grandpapa would find out how he had lied and lied. So very cautiously he uncovered his head and peered out. Everything was quiet. The exit lights made dim pools of red in the duskiness of the corridor. Outside the open window the stars blinked down at him coldly. Something bright on the table caught the light.

Then he remembered—it was his splint, his new brace, and the strange, frightful thing on the chair by the table, that was his clothes! Miss Jimmy had put them there so she could help him dress in the morning. A plan flashed into his brain.

"I will run away!"

It took so long to unfasten the weight from his leg and to lower it gently to the floor, so it would not bang, that he was almost in despair. Surely it would be daylight before he could dress himself. With feverish haste he slipped his trousers and coat over his nightshirt, put on his shoes and was just tugging at the straps of the new brace when he saw Miss Jimmy coming. He dived under the covers and lay very, very still. As soon as he dared, he slipped out of bed, found his crutch, and dragging it with him, crept slowly on his hands and knees toward the stairway. A board creaked once, and it set his teeth to chattering so, it seemed to him everyone would be crying out to know what was the trouble. Still on he crawled, down the long stairway.

As he reached the foot of the stairways, there was a subdued commotion. There must have been an accident. An ambulance had brought some injured people to the hospital. Victor had barely time to dart into an alcove and flatten himself against the wall, when the hall was suddenly busy—nurses, porters, internes, hastening here and there. At the sight of Dr. Coles, a lump came in his throat and for the fraction of a second he doubted the wisdom of his adventure. But he peeked out of the alcove, and saw that the door of the operating room was closed, and all was quiet again. Stealthily he made his way to the great door, raised himself up, balancing with difficulty, and tried the knob. It turned, and he let himself out, holding his breath until the door was closed.

He felt very small, very lonely. The lights in front of the hospital shone down on him mercilessly. A cold wind cut through him, but he must hurry, hurry. He never knew just what happened as he started down the steps—there were five of them—somehow he stumbled or slipped, and with a thud he landed in a heap on the pavement. The noise sounded as terrifying as the thunder of a cavalry charge—he knew that his cause was lost. But strangely enough, no one heard him. After a moment of anxious waiting, he commenced to take account of the damage the fall had done. He was bruised and battered and his beautiful new brace was broken. He picked up his crutch and hobbled away. If he could reach the depot and take the six o'clock train for Basalt, he would be back with Jacques before evening. His return ticket, of course, was in his coat pocket. He felt for it, then he remembered that Miss Jimmy had put it away for him. Everything went black around him.

It was not until Miss Jimmy came to take his temperature, at six o'clock, and found his little white bed empty, that he was missed. Then there was hurrying and scurrying and searching. Presently there was telephoning, and a policeman, and a regular detective, but all in vain. There was the Old Aristocrat, crosser than ever, and suspecting everyone of foul play. There was Miss Jimmy, with a sob in her throat, and swollen eyes, and Dr. Coles, so nervous and puzzled that no one dared to speak to him.

The morning of the third day Jacques appeared at the hospital. Jacques, clear-eyed and confident, with the sureness of success that belongs to a boy of twelve.

"Aw, I'll find him all right," he told Dr. Coles. "I'll find the kid before night."

But by evening Jacques did not feel so confident. He had hunted all day long, but never a sign of Victor could he find. He came back to the hospital, his shoulders drooping, his forehead tied in a knot. They asked him to eat with the nurses, but the food all tasted like dust and ashes, and he choked when he tried to swallow, so he slipped away from the table and wandered out on the front steps. Then Dr. Coles came out, and when he saw Jacques, he held out his hand. Jacques took it, and Dr. Coles pointed to his large brown car, just in front of them.

"Come with me," he said, "I'm going to the smelter—there's a man hurt, and I am going to patch him together again."

It was several miles to the smelter, but the car seemed to eat up the road in a minute, and Jacques was left with only his own black thoughts, and what was fast becoming wild horror in his heart. Dr. Coles soon came back to the car.

"The man wasn't badly hurt," he told Jacques. "I glued him together in no time."

But Jacques was in no mood to be amused. It was drizzling. How did he know but Victor was wandering around in the rain, wet, hungry, cold? Never in his life had Jacques felt so lonely before, so utterly hopeless. Even when his mother was dying, she had turned to him with a smile and whispered, "Jacques, now it will be for you to take care of your brother."

So, mixed with his sorrow was pride because she had trusted him. For two years he had been faithful to that trust, and the task had kept him so busy he had never guessed that he deserved either pity or praise. But the years had left their mark on him—he looked too shrewd, too much a man of the world, until he smiled. Then you saw that his mouth could be infinitely tender. But tonight Jacques was in an ugly mood, and he jerked his cap over his eyes and hunched down in the seat, shivering. The drizzle had turned to rain, and the road, which an hour before had been ankle deep with dust, was getting treacherous. The car wasn't flying along any more.

"Might I will never to find Vic, and then I'd rather be a dead one myself," groaned Jacques.

"Huh?" asked the chauffeur, and all at once the heavy machine skidded and swerved from the road like a

Mohawk's Better Mileage is Simply Natural

Because Mohawks *do* wear longer, many Mohawk users express a desire to know "how we do it."

There is no mystery to Mohawk mileage. It is the most natural mileage possible.

Every Mohawk tire, without a single exception, is built only of the purest rubber grown—not an ounce of the many cost-cutting substitutes—glue, rosin, clay, reclaimed rubber—is ever permitted to be a part of any Mohawk tire.

The fabric in Mohawk tires is the toughest fabric made from the strongest cotton it is possible to buy. Most sizes of Mohawks contain an extra ply of fabric.

Every Mohawk is hand-made, because with machines we could not insure perfect building to every tire.

On not one Mohawk tire will you find the hand work of an inexperienced workman. Mohawk employs only the most expert, careful, experienced builders the tire industry has produced.

This honest method of building a tire was adopted by Mohawk because substantial, reliable sincerity was thought to have been best for you and for the Mohawk Company. That it has been best is evident by the many users—and the many of them who often wonder at Mohawk's unusal mileage.

crazy thing. It woke Jacques from his moping like the crack of a whip. He was alert, steady. He knew in a flash that he had been a coward to think of giving up. He wanted to live, to hunt all over until he found his brother.

Every detail of the landscape was impressed indelibly on his brain. Above them, on the hillside, was an old tumbled down shack, with a crooked little column of smoke coming from the rickety stovepipe. A child was peering out of the half-open door, as though he, too, were looking for his brother.

All this passed through Jacques' mind in one instant, for the car, as it swerved, seemed to gather speed, and before anyone had a chance to realize what was happening, it leaped across a ditch and up a little embankment and against a fence with a crash. The boards of the fence splintered, but a stout cedar post held, and with a quiver and a groan the car stopped. But Jacques was thrown far from the car, and lay, a limp little heap, among the rocks, with the rain beating down on his still, white face. Another second and Dr. Coles was kneeling beside him. The chauffeur was kneeling there, too, looking not at Jacques, but at the surgeon's face, trying to read there the answer to the question he could not bring himself to ask. So neither man saw the little figure slip from the doorway of the shack, and like some timid rabbit creep down the hill, coming closer and closer to the wreck of the car, and straining his eyes through the dusk, to see what lay huddled beyond.

The sound of an auto horn and a sudden flash of light from out the smelter road, and the little rabbit burrowed for cover, under the edge of a convenient boulder, while Dr. Coles straightened up.

"Allan," he said to his chauffeur, "tell them to stop. We will take this boy to the hospital."

He stooped down and lifted Jacques gently, deftly, and carried him to the road. The little rabbit bobbed up again.

It was when Dr. Coles was lifting Jacques into the car that the watcher in the shelter of the boulder saw what he had been waiting for. With a fierce cry he made a dash for the road, but the cry was drowned by a gust of wind and the racing of the engine. He found himself standing alone in the muddy road, looking at the lights on the rear of the fast disappearing car.

Not for a second did he hesitate. Down the road after it he went, hobbling, hopping, trudging, jerking along—a woebegone, brave little figure. Often he fell down, but always he clambered up and pushed on, never making any outcry, or stopping to brush away the tears that rolled down his cheeks. His white teeth were set hard together. One hand gripped his crutch, the other was clenched so that the finger nails dug into the palm.

A mile is a long way when your heart is all but dead within you and you see no hope ahead. But at last, even before the hospital lights came into view, the familiar smell greeted his nostrils—that indescribable mixture from which you can sometimes identify the sickening sweetness of ether and the unbelievable pungency of iodoform. Victor sniffed it eagerly, and in a minute had stumbled up the steps and was ringing the bell furiously. He pushed past the boy who opened the door, no thought of decorous conduct in his mind. One glance down the hall and he spied the Nicest Interne. He tried to shout to him, but his voice was scarcely a whisper.

No one heard what he said, but in two strides the Nicest Interne was beside him.

"Old man, Vic, old man," he cried, "you've come back!"

Jubilantly he swung the mud-covered boy upon his shoulder, regardless of the immaculate freshness of his white clothes.

Then came the husky little voice in his ear, demanding fiercely "Where is Jacques? Oh, I want Jacques!"

Before the Interne could answer, he went on, "But can't you to understand? He is my Jacques—even if he is dead yet—might you could tell me where he is?"

There's nothing the matter with Jacques," answered the Interne, steadily. "He's up in your grandfather's room."

"You mean," Victor interrupted him, "you mean when the automobile broke and all—it didn't to hurt Jacques?" He laughed incredulously. "But I saw him, I tell you, so pale and dead!"

"Stop! He's all right—he only sort of fainted. We'll go up and tell everybody that you've found yourself."

They were halfway upstairs when suddenly Victor's tense little body relaxed.

"Wait!" he implored. "My grandpapa knows yet that I am a liar, does he? There isn't nothing but hate left in his heart—"

"Listen!" cried the Interne. "There is pride in his heart. He knows now and we all know, about your brave father—"

They had reached Twenty-eight. There stood Dr. Coles and Miss Jimmy but all Victor saw was Jacques, wrapped in his grandfather's purple silk lounging robe—not dead, but sitting in a big chair, drinking something out of a glass. The Old Aristocrat's face glowed when he looked at Victor, just as though a lamp had been lighted within it, and he began to blow his nose ostentatiously. Miss Jimmy made a queer little noise in her throat and held out her arms. Then the Nicest Interne handed Victor down to her and she remembered his eight year old dignity barely in time to keep from kissing him. Jacques was the first to speak.

"Hello, Vic."

"Hello, Jacques."

Miss Jimmy put Victor in a chair and knelt down to take off his wet shoes, but the rest began to talk all at once, asking eager questions.

"But Doc-tor," Victor answered, "I can to tell you. I said to myself, 'I will go to Jacques.' But Miss Jimmy you have my ticket. Then I say, 'I can walk with my crutch,' but my splint is broken, see, Doc-tor and Basalt is a long way."

"You didn't try to walk home, Vic?"

"Yes, Jacques, but before it was morning, even such a nice house it was I find, like nobody lived in it—but no, Dannie lives there by himself—"

"And you've been staying with him old man? But why?"

"Yes, sir, I stayed there. We're pardners. When I told Dannie how our family never has no place for a liar—I told him how I had lied so awful to my own grandpapa and everybody—"

"Stop!" cried the Old Aristocrat "You have made a mistake. Is a soldier lying, Victor Dubarre, because he smiles when he is starving? Was your papa lying when he fought on and on even though he was wounded and—dying?"

The old gentleman was pacing back and forth across the room. Now he stopped with one hand on Jacques' shoulder and looked down at Victor The little wrinkles around his eyes were twinkling.

"Victor," he went on thoughtfully, "a gentleman, I think, often needs to be a pretender. But I am tired of pretending—pretending that I did not love your father, you know—pretending that I had forgotten." Then he laughed and held out his hands.

"You and I, we are just old pretenders. Will you shake hands, Victor? Shall we be friends?"

"Oh, but Grandpapa, yes!" shouted Victor, almost upsetting Miss Jimmy as he flung his arms around the Old Aristocrat's neck and gave him a mighty squeeze.

After awhile, when Victor had been bathed and fed and was in his tilted bed once more, Miss Jimmy pushed his hair back and rumpled it as she always did when she told him goodnight. But this time he did not shut his eyes. He reached up and seized her hand in both of his and smiled at her. Then she leaned over and kissed him lightly on his forehead, just as he had always made believe she did.

"Oh, but Miss Jimmy, dear," he whispered, "all the time, now, my grandpapa and I—we tell the truth" Then he chuckled.

"Everything is now so grand, might I never will want to pretend any more!"—Successful Farming.

The value of life is to improve one's condition.

THE CARE OF THE BEDROOM

By A. M. H.

Many housekeepers are so anxious to have their rooms present a neat appearance early in the day that they spread up the beds before breakfast and thus all the impurities ejected through the pores of the human body are well tucked in. If the covers are all thrown back, the exhalations from the body will escape instead of being absorbed by the bed and bed clothes. An hour's airing each morning is sufficient, and this is easily and quickly done by placing two chairs at the foot of the bed and throwing the covers back over them and opening up the windows. In view of the fact that the average person spends about one-third of his or her lifetime in sleep, we should be extremely careful as to the place in which we are to pass this time. We must never forget that while the mind is dormant and the muscles of the body inactive during the period of sleep, the lungs are not so, and therefore we should always sleep in a pure atmosphere and everything about the room should be washable. As nearly as possible the room should be kept free from anything that would tend to contaminate the air.

To keep all receptacles for waste water in a sanitary condition wash out often with hot suds made with dissolved borax soap chips as this cleans well and is a fine disinfectant. All towels and wash cloths are kept soft and white as long as they last by washing and boiling in this hot suds and it is excellent for all cleaning in the bedroom. If feather pillows have been used for a sick person, they can be thoroughly cleaned by putting them in hot soap chip suds and rubbing on the washboard as if washing clothes. All bed coverings, either of cotton or wool, come out soft, clean and of good color by washing in this suds and rinsing and drying in the sunshine. Some persons are so afraid of fresh air and believe it is so injurious that they shut it out entirely from the bedroom at night, but with fresh air in the room the sleep would refresh and strengthen, whereas it is often restless and worrying.

KEEP THE LAMPS SHINING BRIGHTLY

A good many industrious and cleanly disposed housewives, like Aladdin of old, believe in rubbing their metal lamps. Aladdin got what he wished for when he rubbed his glim producer, but the housewife generally gets, in the course of time, what she doesn't want; namely, a shabby appearing lamp, for it doesn't take long to rub the lacquer off metal.

Lamps wouldn't be permitted to remain shabby very long if housekeepers knew how simple a process it is to re-lacquer or re-enamel them. Paint dealers, druggists and dealers in plumbing supplies sell the lacquers and enamels in small quantity containers. Directions for applying usually come with them.

If desired it is possible to make a lamp look like a new one. For instance, a plain brass lamp may be enameled in white or ivory by using the proper undercoating. Other preferred effects are as easily obtainable. So while Aladdin could get something with his lamp that the women of the present day cannot get, they may console themselves by the thought that they can do things with their lamps that he couldn't do.

HOUSEHOLD QUERIES

Mutton Tallow for Shortening

Answering query as to what to mix with mutton tallow to make a good cooking compound, Mrs. W. D. Kendall of Lakewood writes:

"We use one pound tallow rendered separately to one pound pure leaf lard, not bacon grease. Pour together while hot in stone jar or glass fruit jar. Add pinch salt while hot, seal and place in cool place. This makes excellent shortening and will last indefinitely."

TAINT'S RIGHT

Park Orator—An' I tell yer that all them millionaires' money is tainted—all on it.

Unconvinced Person—'Ow d'ye mean "tainted?"

Park Orator—Well, 'taint your'n an' 'taint mine, is it.—London Sketch.

You May Not Know Pianos But You Do Know The Piano Dealer

Few people have the expert knowledge to enable them to distinguish between one piano and another. To be sure they can tell a good tone, but they are not able to determine whether the Piano is worth the price asked. Naturally you will go to a Piano Dealer whose standing in the community is the very highest. There are always good dealers and unscrupulous dealers in every city. It is an easy matter to know the good Piano dealers. If those dealers hadn't been giving "value received" for years, they would not be known as good dealers. Your greatest satisfaction lies in the recommendation of a good Piano Dealer or House.

We invite you to call at any of our stores—or write us asking for illustrated catalogs and prices.

Dealers in Steinway and Other Pianos, Pianola and Duo Art Pianos, Aeolian Player Pianos, Player Rolls, Etc.

ALWAYS RELIABLE

Gombault's CAUSTIC BALSAM

SURE IN RESULTS

THE ACCEPTED VETERINARY AND HUMAN REMEDY

A RELIABLE, safe and active blister and counter irritant--is used successfully by the very best stockmen everywhere. The very fact that it is both "reliable and safe" for anyone to use is of particular interest especially to those who are not veterinarians or within reach of one; and when you consider that many of the veterinary surgeons are buying and using it, you can well believe it is a valuable and reliable veterinary and household remedy.

NOT ONLY SEE WHAT OTHERS SAY, BUT SATISFY YOURSELF BY TRYING IT

CAUSTIC BALSAM
AS A HUMAN REMEDY IS
Penetrating — Soothing — Healing

It is generally true that an external remedy that is good for the animal is also good for the human body, and **Gombault's Caustic Balsam** is no exception to this rule. In fact, we sincerely believe that there is no liniment or external remedy on the market that is as good or as safe and reliable to apply to the human body as **Caustic Balsam.** We can safely recommend it in all cases where an external application could benefit. It is also cheaper according to cost because it requires very little and that little is effective.

A Safe and Reliable Germ Killer

Caustic Balsam, applied at once to any bruise or flesh wound, as soon as it stops bleeding and is thoroughly washed, will prevent blood poison and cause it to heal at once with scarcely any soreness. Persistent, thorough use will cure many old or chronic ailments, and it can always be used on any case that requires an external application, with perfect safety, and good results.

Veterinary surgeons use Caustic Balsam. Many recommend it. Why? Because it is a safe remedy for their customers to use and it brings satisfactory results.

Never Failed To Do Its Work

I am in the saw mill business and keep from twenty to thirty head of stock all the time. I have been using your Gombault's Caustic Balsam for the last ten years and I have tried it for every known lameness and it has never failed to do the work yet. I have cured sweeny and never take them from the wagon. I have tried it on oxen's necks with good results. Hoping this will be some benefit to some stock owner,
Clarence J. Henley, Maplesville, Ala.

Information on special cases freely given. The accepted Human and Veterinary Remedy of the World.

Sure Cure For Rattle Snake Bites

Have used Gombault's Caustic Balsam for years and wouldn't be without it. It will not only do what is claimed for it, but it is also a sure cure for rattle snake bites, if taken in time. We have saved two horses and one cow with it. Thought you might want to put this in your list of cures, as so many use Canstic Balsam, It might save them a horse or cow some time if they knew about it.
S. H. Felt, Hartford, Michigan

Caustic Balsam will absolutely remove all poisonous secretions and create a healthy action.

Caustic Balsam Does More Than Claimed for it.

Enclosed please find draft for which send me one dozen bottles of Gombault's Caustic Balsam. I have been using your Caustic Balsam for four or five years and it does more than you claim for it. A neighbor, Mr. Seegar, had a horse with a bad case of sweeny. He could not sell the animal for $25.00. I advised him to use your Caustic Balsam and he did so, curing the horse, and has since refused $100.00 for her. My niece had her knee badly injured by falling from a wagon. The doctors failed to effect a cure and she began using Canstic Balsam. She is now practically well. I have also known it to cure neuralgia and stop tooth-ache. It is one of the finest medicines for man and beast. H. D. Sweazy, Beecher City, Ill.

Does Away With Firing

TO WHOM IT MAY CONCERN:-
I have made many fine cures with Gombault's Caustic Balsam. I have cured bowed tendons, capped hock, splints, ringbone, sidebone, shoe boil, quitter, poll-evil, fistula of withers and many other long standing cases. It is either a mild blister or a fine counter irritant; does away with firing.
E. L. Seltzer, Shelltown, Md.

Caustic Balsam Does More Than Guaranteed

I have used Caustic Balsam for the last seven years and found it just as it was recommended, and even more, because it will cure where other medicine fails and I can prove it. I can certainly recommend it. J. T. Sullivan, Chehanse, Ill.

Twenty Years Success With Caustic Balsam

After using Gombault's Caustic Balsam for twenty years I can say it has never failed to do all you recommend it to do. While it seems high to one that has never tried it, once a customer always one. I have used it for twenty years and use no other but it. W.A.McCaulcy, Malone, Tex.

Good For Any Cut or Bruise

I recommend your Caustic Balsam for any kind of rusty nail or barb wire cut and has also cured had cases of blood poisoning. I am a veterinarian and surgeon and I recommend to any man this Caustic Balsam as a cure of what I said.
F. Max Scheibe, V.S., Dulce, N. Mex

Gombault's Caustic Balsam
As a Liniment for the Human Body has no Equal

A Liniment that benefits; it kills pain. A home remedy for the Human Family

ALL TESTS prove the wonderful efficiency of **Gombault's Caustic Balsam** in relieving human ailments, such as Rheumatism, Neuralgia, Sprains, Sore Throat, Sore Lungs, Chest Cold, Backache, Lumbago, Diphtheria, all Stiff Joints. It is penetrating, soothing and healing, and for Old Sores, Bruises or Wounds, Felons, External Tumors, Cancers, Boils, Corns or Bunions **Caustic Balsam has no equal. It removes the soreness and strengthens the muscles**—in fact aids all troubles where an external application is necessary. **We would distinctly say to all who buy it that it does not contain a particle of poisonous substance, and therefore no harm can possibly result from its use.**

THIS GREAT REMEDY literally works wonders! It removes bunches on horses and other livestock, thereby increasing the value of the animal fully 50 percent. A successful treatment for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Windpuffs, all Skin Diseases or Parasites, Thrush, Diphtheria, Pink Eye, and Lameness from Spavin, Ringbone, and other Bony Tumors; also all obstructions in circulation, and imparts new life and vigor. It is a peerless remedy for all Throat and Bronchial Troubles.

WHY! Because Caustic Balsam can be applied by anyone with safety, will do its work well and in no way injure the horse, while other blisters need daily attention and care and then are liable to leave a blemish.

If you have a lame or unsound horse, YOU CAN WELL AFFORD TO TRY A REMEDY THAT IS SO HIGHLY RECOMMENDED.
Information on special cases freely given on request.
It is FAR SUPERIOR, MORE ECONOMICAL, and a PERFECTLY SAFE, RELIABLE and PROMPT Remedy to use as compared with any other remedy used for like purposes.
The demand is produced strictly by its merits.
IT SUPERSEDES ALL CAUTERY OR FIRING
IMPOSSIBLE TO PRODUCE ANY SCAR OR BLEMISH
IT IS THE SAFEST AND BEST BLISTER

CAREFUL FARMERS
USE CAUSTIC BALSAM
A Safe and Reliable Anticeptic

Do you turn your horses out for the winter? If so, we want to call your attention to a very important matter. Horses which have been used steadily at work, either on the farm or road, have quite likely had some strains whereby lameness or enlargements have been caused. Or perhaps new life is needed to be infused into their legs. Gombault's Caustic Balsam, applied as per directions, just as you are turning the horses out, will be of great benefit; and this is the time when it can be used very successfully. One great advantage in using this remedy is that after it is applied it needs no care or attention, but does its work well and at a time when the horse is having a rest. Of course, it can be used with equal success while horses are in the stable, but many people in turning their horses out would use Caustic Balsam if they were reminded of it, and this article is given as a reminder.

Found Nothing That Equals Caustic Balsam

Kindly permit me to express my deep appreciation of Gombault's Caustic Balsam. I have cured sprains, ringbone, strained tendons, sweeny, poll-evil with it in fine shape and do not see how a better liniment could be manufactured. I have used many things for removing puffs from horses but have never found any that would equal Caustic Balsam. I also had a cow that had lump jaw. I used Caustic Balsam and cured it.
John H. Wallgren, Logan, Kansas

Bunches on horses or any other livestock are unsightly.

Caustic Balsam Prevents Blood Poison

We have used Canstic Balsam for several years and have found it to be unequaled for horses or people. My husband ran a rusty nail in his hand and blood poison set in. We used two applications of Caustic Balsam and the swelling and fever left his hand and arm and it healed up without any more bother. It is also as efficient for snake bites and we would not think of being without it.
L. H. Globe, Forest Grove, Mont.

Caustic Balsam is good for that sore feeling after baseball or football games.

A Splendid Human Remedy

I think your Caustic Balsam a splendid human remedy. We use it for cuts, burns, sores, swellings, sore throat and lameness and find it very beneficial. We expect to keep it on hand ready for any emergency.
Mrs. Roht. B. Newton, Columbus, Miss.

The world's greatest and surest veterinary and human remedy. Has imitators, but no competitors.

Worth Its Weight In Gold

I have used Gombault's Caustic Balsam for my own horses and for others, and it has never failed yet. My little girl had rheumatism for a long time. Nothing did her any good until we used Caustic Balsam and she is all right. My wife had throat trouble and used Caustic Balsam with great results. It is worth its weight in gold.

Motor Truck Big Factor in Modern Farming

By C. B. Messenger

NOW comes cooperative trucking. To buy a heavy tired auto truck these days takes a pile of long green almost as big as a stack of hay. Hence, cooperation. Sometimes cooperation of a neighborhood in the use of the machine only, more often in sending daily to market a five ton or smaller truck loaded to the guards and in the hands of a practical business man who gets the best prices on the market and very probably returns with the truck loaded with implements, fertilizers or supplies needed on the farms.

This is different from the good old days when each individual producer and marketer loaded the gatherings from his own farm and between midnight and morning plodded in to reach the early market. It's a modern day method. The department of agriculture has canvassed the situation and estimates that cooperative associations are now marketing annually $1,500,000,000 in commodities. Rather, that is the estimate made in 1919; today's commodities, with increase in value and increase in magnitude and number of cooperative associations, would doubtless double the figures of last year.

The outlying producing sections have been brought vastly closer to the large consuming centers. Truck crops and fruits a score or two score of miles out are readily delivered for the early morning market. Even the San Joaquin Valley is daily sending over and down the sides of the Tehachapi into Los Angeles products of creameries and orchards. The northern San Joaquin Valley and all of the Sacramento Valley, which formerly used almost exclusively barges on the river or rail transportation, are today utilizing the truck.

There are in California something over 12,000 heavy tired large trucks. There are of the lighter delivery truck, or sometimes made-over-auto truck, over 22,000, and the number of trailers is legion. The national council of defense made a survey of the state of California and remarked upon the extensive use of motor trucks for passenger, freight and express haulage. In 1918 "over 136 separate lines were found, some traversing routes as long as 125 miles, this on daily trips. Large quantities of farm produce are handled and charges are made according to published rates. The excellent highways of California made it possible for these lines to develop rapidly. The council would encourage this type of transportation because

"Food production is stimulated since the regular outlet to market encourages many farmers to expand production which they would not be justified in doing if they were obliged to transport their own produce to market.

"Shortage of labor is greatly offset from the fact that the system leaves the farmer on the farm and his time is not consumed in trips to market.

"There is immediate improvement in the efficiency of the farm since supplies, machinery, and repairs can be secured promptly from city distributors of fertilizers and farm machinery."

From the national standpoint these routes aid in several ways:

"They relieve the railroads of local freight which permits carload lots of materials and foodstuffs from distant points to enter the terminals."

This leads to just a word about good roads. California boasts, and not unduly, of the great mileage and high quality of the roads it has constructed, but there is many a highly productive section which needs this added encouragement. The state, the nation and various counties are uniting in extending highways. Speed the work.

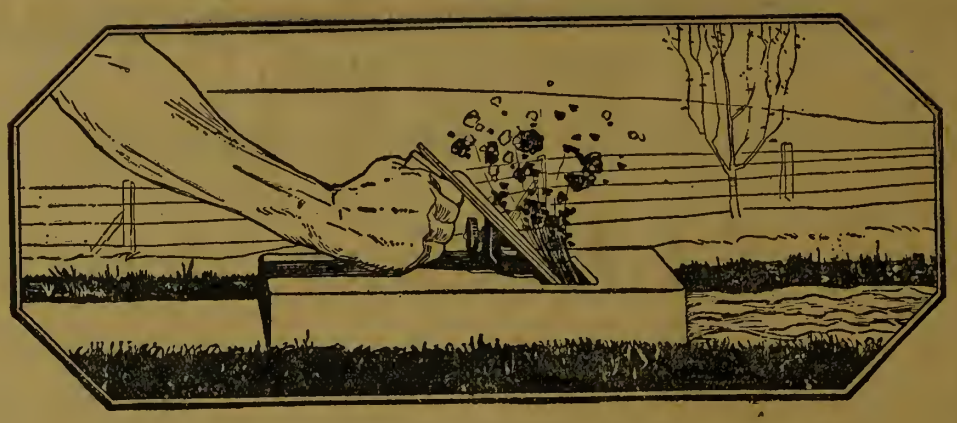
Secretary Houston in closing his last annual report has this to say about it:

Good Roads

"Good roads are essential to the prosperity and well being of urban and rural communities alike. They are prerequisite for the orderly and systematic marketing of farm prod- (Continued on Page 535).

Overland

TRADE MARK REG.



The Wonderful New *Triplex* Springs Seem To Plane Down Road Bumps

YOU will welcome the freedom from ordinary swaying, bouncing and pitching made possible *for the first time in a light car* by the three-point suspension *Triplex* Springs.

You do not always have smooth paved streets to drive on—and you usually take longer trips than the city car owner.

No one will appreciate more than you the wonderful riding comfort of the new Overland 4.

These springs give heavy car comfort and road steadiness together with the economy of light weight. Fuel is economized—tires wear longer!

But Overland 4 value and conveniences do not end there. It is a fine looking car, roomy, modern in every respect, luxuriously upholstered, and fully equipped from Auto-Lite Starting and Lighting to electric horn.

See the Overland dealer—test this car on rough roads.

California Cultivator

Vol. LIV, No. 13 Los Angeles, March 27, 1920 One Dollar Yearly

More Scared Than Hurt, but Hurts Just the Same

By C. B. Messenger

NO greater injury was ever suffered by any California industry than that which has come to the olive industry because of the recent food poisoning cases. Tragedy after tragedy has been recorded and the sensational methods of Eastern papers in playing up "news," often in wood type across the top of first pages, have given California ripe olives a blow from which it will take years to recover.

The Cultivator, and practically every other California paper, at first took the position that after all these years of eating California olives, with never a case of poisoning reported prior to last August, it seemed that the physicians had made some terrible mistake. Scientists have, however, been making investigation and three of the cases have been traced directly to one or two small lots of bottled olives in which the botulinus germ has been discovered. Health boards and other scientific bodies have examined tens of thousands of tins of olives and there has been no case where such fruit has proven infected. This has brought many statements similar to this from Michigan:

Food and Drug Department
Lansing, Dec. 16, 1919.

California Olive Association,
528 Higgins Building,
Los Angeles, Cal.

Gentlemen:

The work done by the State Board of Health laboratories on olives was done at our request on samples furnished by us and was used as a check on similar work that was being carried on at the same time in our own laboratories. Will say that we did not find any trace of botulinus or anything else that was in any way dangerous in these products.

I am convinced that those cases of poisoning that have been reported were isolated cases that might develop once in a million times in any product and in no way indicates that this brand of olives as a whole is dangerous.

This department has not condemned any of these olives and has released all those that we asked the merchants to hold, while examination was being made. Hoping that this answers your inquiry satisfactorily, I am,

Yours very truly,
Fred L. Woodworth,
Food and Drug Commissioner, State of Michigan.

Californians as a rule have not the faintest idea of the treatment which has been given these cases in the Eastern papers. We have seen literally thousands of clippings from papers from every state in the Union, and, unfortunately, the great majority show that Eastern papers have grasped the opportunity to give California producers advertising which is far from desirable. For instance, here is one from the Hartford, Connecticut, Courant:

"The Malevolent Olive.—Cases of poisoning, frequently resulting in death and caused by eating ripe olives, and which had been canned somewhere on the Pacific Coast, continue to be reported. Two weeks ago, or less, dispatches told of a family in South Paris, Maine, the members of which had been rendered extremely uncomfortable through eating these evil disposed plums, and yesterday we were told of a more serious case in Memphis, Tennessee, for in this instance several members of a family have died because of eating canned ripe olives.

"Physicians are interested and are, possibly, wondering why the poison in this fruit is of such a deadly nature. Suggestions have been made to the effect that cans of this delicacy should be brought to the boiling point before they are opened for use, which process is sure to put an end to the bacilli should they chance to be present in the can. As 'The Courant' has already said, a more simple and equally satisfactory method consists in shunning canned ripe olives altogether.

"There is no statute making the use of ripe olives mandatory upon anyone, whether the fruit is canned or otherwise, and it is not one of the necessities without which no meal is complete. By declining to eat the ripe olive and buying the pickled green ones instead, one has a good chance of finding his days long in the land."

Fortunately, this editorial writer shows his prejudice in favor of the importer of olives, for he still has a good word in favor of the green pickled olive which, of course, means the imported olive.

Shut our eyes to the situation as we may and state simply the truth that the hysterical treatment which is given by nearly all the Eastern press is unjust and even used in such a way as to convey an untruth as to the worth and safety of one of California's finest food products, the fact remains that the consumption of California olives is today probably not one-half that of a few months ago. Orders are being cancelled and an industry involving nearly $5,000,000 annually is jeopardized. The California Olive Association, comprised of the majority of the largest olive packing concerns in the state, is employing some of the country's best chemists and scientists and gathering data as to the situation and best steps to take. It has, however, taken one step which will help to restore confidence. It has been recommended that large bottled olives which were sterilized at temperatures of 212 and under be recalled and only stock known to have been treated so there is no question of its purity and safety is to be allowed to remain on the market. The factory equipment is to be overhauled and improved so that sterilization will be so thoroughly accomplished that the consumer will be assured that one of California's finest foods is as safe as any other.

This matter of food poisoning has come up at intervals for many years. The first cases were ascribed to the poison being carried in sausages. This gave the name botuline (botulus—sausage) and because of that this definition found its way into the dictionary: "Med. a poisonous ptomaine found in spoiled sausages and canned or tinned meats." But later there came cases of poisoning from home canned fruits, canned corn and other vegetables, and especially canned string beans. In each of these cases it has been found that the poison is easily prevented by thorough sterilization by the use of heat. The olive has been thought to be entirely exempt. It is now taking its turn, and the only procedure is to create conditions which prevent the poison from ever securing entrance into a can or a bottle, and then, so far as possible, informing the consumer of the value of this product.

California produced last year nearly 8,000 tons of olives. The coming year's output cannot be safely predicted so early in the season, but as the past three years crops have been light, many are anticipating an exceptionally large output this year, and by large is meant 12,000 to 15,000 tons. There are nearly 2,000 growers in the state; there are 30 packing plants employing hundreds of people. The state cannot consent to seeing this great industry endangered as it is being by our shutting our eyes to the real condition of things. The efforts of the packers and the larger growers must be supported. They have enlisted the cooperation of our state university, state department of agriculture, United States department of agriculture, and boards of health.

Speaking of the situation, J. J. Hoey, editor of the Fig and Olive Journal, also secretary of the association, says:

"For 16 years the packers and growers of olives in California have labored diligently, persistently and in the face of a multitude of discouraging factors in order to establish an industry that has added luster to the fair name of this state, given to our people a new and typically American product, and bade fair to become in a few years one of our largest and most valuable food producing enterprises. The ripe olive, most delicious and healthful of foods, is the basis of our industry, and on that foundation we seek to build a business that will utilize our incomparable natural resources in this state, create employment for our citizens, profit for our growers and manufacturers, and give to the people of this country a food product unexcelled for flavor and nutritiveness.

"We have nearly 40,000 acres planted to olives in California and Arizona. Thirty factories process and pack the product from this acreage. Our industry represents an invested value of nearly $20,000,000. Our annual output in a favorable season is valued at nearly $5,000,000. It is possible for us to increase this output, through the development of wider markets, until its value will be $50,000,000.

"This great industry, founded on the costly experiences of the pioneers and builded on the sacrifices of those whose confidence in the future greatness of the ripe olive business overcame all obstacles to its growth, is today facing a crisis. Its future development is seriously menaced; its present stability indeed is threatened—and this because of the unfortunate happenings in the past few months in which several persons in this country lost their lives through botulinus poisoning, said to be caused by eating olives that had become spoiled."

The University of California is giving particular attention to the olive situation. It has issued the following written by Prof. W. V. Cruess, zymologist:

"Ripe Olives a Safe Food

"In recent years a number of cases of botulinus poisoning have resulted from the use of home canned fruits and vegetables, notably from home canned apricots and string beans. More recently, two jars of olives from one small lot of ripe olives were responsible for two outbreaks of the above nature in Eastern states. This fruit had never been known to be the cause of botulinus poisoning during

(Continued on Page 532)

Many a California Landscape Is More Beautiful Because of the Olive Orchards

Agricultural News Notes of the Pacific Coast

Northern California

The state is taking a hand in control of water supply for the coming year.

Governor Stephens is appealing for greater gardening activities during 1920.

Recent rains were greatly appreciated by livestock men and all producers.

Alameda County's farm adviser will have a permanent branch office at Livermore.

Sonoma County Fair Association is planning for an agricultural fair the coming fall.

The Pea Growers Association at Hayward, Alameda County, has begun shipment of green peas.

An effort is being made to set aside a tract of land including the summit of Mt. Lassen for a national park.

The farm bureau at Orland has purchased a sawmill and is prepared to supply members with building material.

The Alameda County farm bureau will appoint a financial secretary to handle the marketing business of the bureau.

Mendocino County wine grape growers held two meetings on Sunday, March 14, one at Ukiah and one at Hopland.

Well irrigators are meeting in Glenn County and discussing means of providing against the water and power shortage.

The Chico Enterprise announces that at least 25 septic tanks will be built on ranches near Chico the coming season.

The farm bureau of Livermore, Alameda County, is planning a stock judging contest in connection with its May Day celebration.

Wine grape people are very active in providing means of disposal of wine grapes, syrups, unfermented juices and other products of the grape.

A superior judge in Alameda County has set aside the real estate transactions in which a Japanese nurseryman was securing title to land for nursery.

The California Rice Growers Association is pointing out that owing to water shortage it will be necessary to greatly reduce rice production this season.

At a largely attended meeting of water and power users at Willows, Glenn County, on March 10, a committee was appointed to confer with the railway commission.

The California Cattlemen's Association, which was prepared to ship cattle out of the state to pasture land, has cancelled its arrangements because of the recent rainfall.

The Ehmann Olive Company is building fine large packing plant which will be ready for the 1920 olive crop. The old plant, now to be abandoned, was the first of its kind built in the state.

Butte ranchers have filed suit to prevent the Sutter-Butte Canal Company from furnishing water for irrigation to 14,000 acres of new rice land in Sutter County. Contract for this water service was made last year.

The Happy Valley irrigation district in Shasta County has just made sale of $100,000 of its bonds, being the last of the issue. The storage dam is completed and in shape to supply irrigation water for the coming season.

Central California

Madera farmers are talking cotton.

Fresno has voted $4,800,000 for good roads.

Tulare is shipping eggs direct to New York.

Bishop, Inyo County, recently held a tractor demonstration.

Many wine grape vineyardists are planning for drying plants.

Japanese control more than 5,000 acres of Stanislaus County.

Watsonville's precipitation in the recent rain totaled three inches.

The tonnage of wine grapes next season will be not far from 300,000.

The seasonal precipitation in middle San Joaquin Valley is around six inches.

Buyers in Turlock, Tulare County, district are offering $40 per ton for grapes.

The farm bureau of Santa Cruz County will organize a marketing department.

Europe is economizing and California dried fruits are in lighter demand for export.

Elkhorn Grange, Santa Cruz County, recently initiated a large number of new members.

Tulare made its first carload shipment of eggs to New York the first week in March.

Reedley will have a branch packing house of the California Prune and Apricot Growers.

California Associated Raisin Company shipped over 322,000,000 pounds raisins last year.

Several new grape dryers are to be built at Lodi, San Joaquin County, to care for the wine grape crop.

A sorghum club was organized in the Hughson high school by Farm Adviser Jungerman. Each member will cultivate one acre of sorghum.

The newly organized Fig Growers Association is reported to be considering joining in the marketing organization with the Peach Growers.

H. E. Patterson, secretary of the Fresno County chamber of commerce, has been appointed general manager of the Raisin Day celebration, April 30.

Under the chairmanship of J. W. Schmitz of Madera County the state farm bureau federation is conducting a campaign for improvement of livestock.

The Fresno County farm bureau has decided to cooperate in every way with the state wool pool as outlined by the marketing department of the California Federation of Farm Bureaus.

The Fresno County Historical Society is taking steps to preserve the ground surrounding the grave of Smith of Smith's Ferry, an old historic spot on the Santa Fe trail to San Francisco.

The California Associated Raisin Company has discontinued its policy of making sales on the "firm at opening price," which furnished a point of attack by jobbers and independent growers against the company.

Santa Cruz County has enacted a drastic bee ordinance. It vests in the bee inspector absolute power to declare quarantine against importation of any bees or bee products. The ordinance is similar to the one in effect in Imperial County.

Southern California

Apricot growers are fighting bacterial gummosis.

Dates for San Diego County fair, September 22-25.

Imperial Valley wheat growing prospects fair for the coming season.

Antelope Valley, Los Angeles County, squirrel drive March 31-April 3.

Imperial County shipped 1,127 carloads of fresh vegetables in February.

Nuevo, Riverside County, is planning the erection of a $3,000 community hall.

Ranchers of Westminster, Orange County, met March 17 to discuss drainage problems.

Well up towards 100 cars of lettuce sometimes leave Imperial Valley in a single 24 hours.

The Orange County farm bureau is trying to secure the June citrus institute for Santa Ana.

The cannery proposed to be erected at San Jacinto, it is now thought, will not be put in this year.

The annual meeting of the San Diego County farm bureau was held in San Diego last Saturday.

Ventura County fair anticipates that $17,000 will be necessary to finance the coming season's show.

Farm bureau meetings will be held in Los Angeles County at Downey, April 5, and Glendora, April 12.

Fruit growers of Victor Valley recently met at Victorville and discussed forming a marketing association.

The California Cattlemen's Association will hold its semi-annual convention at Los Angeles, April 15 and 16.

Offices of the Los Angelels County farm bureau have been moved to more commodious quarters in the court house.

A squirrel drive for the west side of Antelope Valley, Los Angeles County, has been planned from March 29 to April 3.

The directors of the California Lima Bean Growers Association have found that the market justifies a stiffening of price.

The California Lima Bean Growers Association reports large Limas showing slight advance; baby Limas holding steady.

A new cannery at Riverside, made possible by the efforts of the farm bureau, will mean much to fruit growers of the county.

County Commissioner Sharp of Riverside recently detected one large shipment of peach trees from an eastern state infested with peach yellows.

Imperial Valley board of supervisors recently opened highway paving bids. A big campaign of road improvement is contemplated for the entire valley.

Members of the farm bureau in Antelope Valley, Los Angeles County, will receive cotton seed from the United States department of agriculture for experimental plantings.

Manager P. T. Marbie of the walnut house at Goleta, Santa Barbara County, has invented a walnut cleaning machine that will enable the association to dispense with several hands.

Secretary Van Pelt of the Southern California Fair Association reports materially increased facilities for handling the coming fall fair at Riverside. The fair will open October 13.

The Coast and General

Portland will hold her 1920 rose festival, June 24 and 25.

Lane County, Oregon, is working for $2,000,000 good roads bonds.

Stevens County, Washington, will hold its county fair September 22-24.

A marketing association has been formed by the fruit growers at Skagit, Washington.

The Arizona cotton growers are plowing and fitting seedbed for next season's crop.

Movement is under way to organize the wheat growers of Washington, Oregon and Idaho.

A pure bred hog sale will be held on the fair grounds at Walla Walla, Washington, this week.

Wheat growers of the Inland Empire of Washington are signing up in a cooperative marketing association.

Sugar beet growers of Walla Walla, Washington, will greatly increase beet acreage, perhaps double that of last season.

The American Jersey Cattle Club has appropriated $1,000 for premiums at the 1920 Pacific International at Portland.

A silo campaign which will touch every county in Oregon is planned by the farm bureau and state agricultural college extension service.

Chief of the animal industry division, Philippine Islands, recently purchased 100 Hereford bulls and a number of heifers from Texas breeders.

Cold storage for at least 200,000 boxes of apples will be provided by erection of a new plant by the Fruit Growers Association of Peshastin, Chelan County, Washington.

Sweet potato growers meeting last week in Dallas, Texas, subscribed $5,000 toward an advertising fund to create a market for Southern sweet potatoes in the North.

Apple growers and shippers of Hood River are combining to secure return to more attractive standardized pack. It has been allowed to deteriorate during the last two years.

At the meeting of the Arizona Cattle Growers Association recently held in Tucson the K. and K. bills for regulating the big packers were under hot discussion, but no resolutions favored or disfavored.

With the signature of 106 fruit growers pledging 4,251 acres, representatives of the Oregon Growers Cooperative Association have announced that that organization will operate in the Rogue River Valley in 1920.

California rice millers have shipped 15,000 tons of rice to Sumatra, within hailing distance of the largest rice producing area in the world. This was caused by the crop shortage in Siam and adjoining countries of Southern Asia.

The Apple Growers Association at Hood River, Oregon, has closed its pools on the 1919 pear crop, the total returns for which reached $164,847.18. The total tonnage was 60,741 boxes. The Boscs, the highest priced pears, sold for $2.32 each.

The Snohomish County, Washington, Dairymen's Association has adopted a resolution making it impossible for any more Asiatics to become members of their association. Several Japanese now in the association will be permitted to retain their membership.

Land Settlement Plans at Delhi

THE legislative committee of the American Legion has taken interest in the state land settlement at Durham, especially in view of the fact that the land settlement commission has announced that, other things being equal, ex-service men will be given preference in locating on these lands. The legislative committee feels that steps should be taken by the next state legislature, or possibly through the initiative to make future land settlements open only to ex-service men and, in addition, that the present $1,500 capital requirement should be revoked and the service men accepted without this preliminary payment which has been required of all settlers at Durham and will be required of those at Delhi.

This proposal called forth an open letter from Dr. Elwood Mead, chairman of the state land settlement board.

We believe Dr. Mead's position will be supported by the farmers and taxpayers of California. Dr. Mead so clearly defines the advantages which it is hoped to secure from this land settlement plan and explains the intent of the act and the working details of the settlement at Delhi so clearly that we quote largely from his letter:

* * *

By Prof. Elwood Mead

"The 51 farms and 24 farm workers' allotments which form the first unit of the Delhi settlement will be open to inspection by settlers for four weeks from March 23. The second unit will be opened to settlers as rapidly as the farms can be made ready. The land is in the Turlock irrigation district and all of the farms have rights in the district canals. Some of them can be supplied from the canals by gravity; others will be irrigated from concrete pipe lines supplied by pumps.

"When the board acquired this land much of it was not provided with water and practically none of it had been prepared for irrigation. Since then a large number of men, teams and tractors have been at work. Settlers will find 200 acres seeded to alfalfa, 160 acres planted to grapes and 500 acres seeded to rye. Four of the farms have houses. Plans are being made for other houses and a pamphlet of house plans has been prepared to help settlers decide what they desire.

"This settlement is crossed by the Southern Pacific railroad and the concrete state highway. The farms surround the town of Delhi which has a fine natural location. It will be an important market center and is one of the gateways to Yosemite. Professor J. W. Gregg of the university has prepared the town plan. It is greatly admired by all who have studied it and these include practical railway men, intending settlers, and expert town planners.

"Thirty-eight farms vary in area from 20 to 70 acres. Thirteen are poultry farms and vary in size from four to 10½ acres. The latter are close to Delhi, have a sandy soil, and poultry experts consulted believe they are well suited to this purpose. The 24 farm workers' allotments have areas varying from two to 37 acres. All are near Delhi and steady work at good wages on the farms or in the town seems assured.

"The prices of the farms will vary from $75 to $300 an acre. This includes the cost of the land, which varied from $92.50 to $150 an acre, the cost of the concrete pipe lines for irrigation, the estimated outlay for interest and taxes before the land is sold, and the expenses of administration until the money is paid back to the state.

"The farm workers' allotments vary in price from $150 to $350 an acre. The settler is given 36 years in which to pay for the land and 20 years in which to pay for improvements.

Nation Wide Interest in Settlement

"Interest in this settlement is widespread. For months the board's office at Berkeley has received from 20 to 50 inquiries daily. Thousands of people have said they desire to obtain farms under the act. They live in every state in the union. A large percentage are ex-service men. This is the first American state to help soldiers secure farms, but this is not an exclusive soldier settlement. The original act was passed to help worthy landless men obtain homes in the country and to create the kind of rural life the state needs.

"The act was amended in 1919 to enable this state to cooperate with the federal government in providing farms for soldiers which it was then thought would soon be a national policy. Under the amended act, for any farms made available in cooperation with the United States government, ex-service men were to have a preference, but congress has not acted. The settlement at Delhi is a state settlement. The act in such cases authorizes the board to give preference to ex-service men who are citizens of California, and the board has announced that dealing with applicants at Delhi it will give such preference, and there is every reason to believe that all, or practically all, of the settlers in the first unit will be ex-service men.

"This act only requires the settler to make a first payment of five per cent of the cost of the land, and at Delhi that includes the cost of pipelines to water the land. The state, therefore, lends the settler 95 per cent of the cost of the irrigated farm. No country that requires all the money to be repaid gives more generous terms. Denmark requires the settler to pay ten per cent of the cost when he takes the farm and there is a growing opinion that it ought to be one-fifth of the cost. The board is clear that that five per cent payment should be made and that no one who has not the money to make it should be accepted, and the statute requires it.

"The board, under the statute, can lend a settler $3,000 with which to build his house and barn, prepare his land for irrigation, buy livestock and implements, but under a board rule, approved by the governor, it can only loan 60 cents of every dollar of the cost; the settler must put up the remainder. The settler must, therefore, have $400 to be able to borrow $600.

"This loan of money at five per cent interest with 20 years' time on improvements and 36 years' time on land are generous helps, but they are made greater by the service that the board extends in getting farms in shape. The settlers at Delhi who secure the farms already seeded to alfalfa have an income assured for the first year. The settlers who get vineyards planted buy their grape vines for $30 a thousand because the board bought the raisin grape vines in lots of 100,000. If the settler had to purchase those vines in small lots he would have to pay three times this cost and he would come on the ground too late to plant them this year.

"The board helps the settlers to organize to buy and sell together. The 50 feet by 100 feet warehouse now going up at Delhi is to make it possible for settlers to buy in carload lots for cash and so get wholesale prices. The story of what has been done in Durham in the buying of dairy cattle and the selling of milk is a story of money saved in starting the farm and a large increase in the money that comes from the farm.

"The board has studied the records of state aided settlement in other countries and does not know of anywhere settlers secure as large farms as at Delhi with a capital of less than $1,500. Some tried it with less and found it was a mistake both for the settler and to the state. The settlers at Durham believe that a $1,500 limitation is too low, that the board ought not to accept anyone with less than $2,500 or $3,000, and that they have just been through the mill and know how they felt when they saw their money going out and were afraid there was not enough to go through. The board therefore feels that to accept a settler with less than $1,500 would be going contrary to experience and to its own judgment. It will accept settlers with $1,500 on the smaller farms, but on large farms like those of 56 and 70 acres, the settlers ought to have more capital and the applicants with more capital will be the ones that will be accepted.

"I believe it is to the interest of all home seekers that all settlements under this act should repay with interest the money the state provides and the law requires this. They will do this so long as the present requirements of character, capital and experience are maintained. This does not, however, exclude men without capital. The farm laborer can get a 2 acre block by paying five per cent of its cost. No question is asked about his capital. Payments can be saved out of wages. The semi-annual interest bill is far less than rent. The farm laborer's allotment is, therefore, the stepping stone to the farm. The children of farm laborers at Durham and Delhi will be farm owners in the next 20 years.

"The board has prepared a short statement of the conditions of settlement which will be mailed to posts or to individual applicants. We hope many who do not want farms now will visit the settlement during the 30 days it will be open to inspection. Geo. C. Kreutzer, superintendent at Durham, will be there to give applicants the benefit of his experience on two continents in this kind of development. I want you to see the preparation being made for opening the second unit to settlers; this includes the planting of four tons of peach pits and the planting of one million grape vines as stock for the future nursery.

"Before the land was bought and as a preparation for its subdivision into farms, the soil was examined and a soil map made by the soils division of the University of California. There is being mailed you with this a bulletin prepared by the university for these settlers. It represents the studies on the ground of five professors of the college of agriculture and deals with land, irrigation, grapes, orchard fruits, melons and sweet potatoes, this practical advice at the outset helping settlers to avoid mistakes and loss of time and effort. It is this kind of homely helpful aid rendered by the college of agriculture, the state department of agriculture and the board which makes the California land settlement act so fruitful of results and creates the widespread desire for homes on these settlements.

"I have had a number of talks with members of the committee about amendments to the act which it is proposed to initiate and have received a number of resolutions adopted by different posts on this subject. Some of these amendments, I hope will prevail. Some I am confident the Legion will modify when more fully informed.

"One amendment which is heartily approved provides for two ex-service members on the board, either by increasing the number of members or displacing two of the present members. If the latter plan is followed I would be perfectly willing to give way to an ex-service man whenever this is desired by the governor.

"Changes which are regarded as unwise are those which would do away with any requirements as to capital or payments of settlers when taking possession of the land. I do not believe such amendments could be made without incurring serious losses. In considering such radical financial changes, it must be remembered that this act is not an experiment. For more than a quarter of a century other countries did the experimenting. The Irish land settlement act, the Danish land settlement act, the German land settlement act and the Australian and New Zealand land setlement acts went through an evolution until they reached a practical agreement as to what the state could safely and wisely do and if an attempt was made to do more, failure would result. When the California act was written, the accumulated experience of these countries was before our lawmakers. The endeavor was to make it as generous as is could be made and keep it solvent, but not to include features which would involve losses and require the taxpayers of the state to settle the bill.

"The financial changes proposed would cast aside all the act's financial safeguards. Such action is not regarded as necessary by nine out of ten of the members of the Legion with whom I have talked. They feel that they can meet the requirements of the act, that its opportunities are broad enough as they now exist.

"This applies to the members of the Legion who are in good health. They all believe, however, and I share in the belief, that there is need for a separate soldier settlement act to provide for men injured in the war or to give training to men who lack experience needed to meet the payments under this act. Such an act would be entirely different from this measure. It would provide training farms for beginners. It would fit the size of farms and the conditions of agriculture to the needs of those who want a farm as a means of restoring their health and strength. It would not be expected to pay its way. The state would gladly meet the losses incurred as a measure of gratitude and recognition of services rendered and sacrifices and suffering endured. Such a measure

THE SILVA-BERGTHOLDT CO. CALIFORNIA FRUITS NEWCASTLE, CAL.

—hundreds of varieties on 1500 acres

Experience gained in the actual growing of practically every improved variety of orchard fruits qualifies us to advise you what to do when trouble crops out.

The Silva-Bergtholdt Co. wants every grower to feel at liberty to ask for any advice that might prove of value in restoring ailing trees to health, or keeping normal trees at full vigor.

Replacements will not be necessary if intensive cultivation is practiced, with occasional irrigation during the dry spell. Do this, and you will have a good stand on your planting of this year.

Trees must be perpetuated. No effort is too great if it means the survival of the tree until nurserymen's stocks are back to normal size.

For you to lose a tree now is a calamity. Our experience, coupled with yours, may be just what is needed to eradicate all trouble. Consult us promptly; such helpful suggestions as we may offer will obligate you not at all. Just write. "A stitch in time saves nine."

On account of the poor germination of fruit tree stock last year throughout the United States, the supply of trees for the planting season of January and February, 1921, will not be over 60 per cent of normal. The enormous prosperity of the California fruit grower and the absolute assurance of future profits in horticulture will create a 200 per cent demand for next year's 60 per cent supply. You know what that means.

Write us now concerning your next season's wants. The prices at which you can buy now are less than they will be next Fall. A large proportion of next year's supply of trees has already been booked.

We are affiliated with the California Nurserymen's Bud Selection Association, an organization whose efforts will be devoted to the selection of the best and the elimination of undesirable types of fruit.

Our foot-hill location, in which we grow hundreds of varieties on 1500 acres of orchard and nursery, affords a natural advantage resulting in well branched, fibrous root systems for our trees, and freedom from disease. We spare no effort, cost or labor to deliver the best trees that can be grown.

J. E. Bergtholdt

Foot-hill grown trees are immune from crown-gall and root-knot
Roots such as are grown only on our foot-hill soil and location THEY ARE TREE INSURANCE

Plowing in Cover Crops

By Ernest Braunton

A SUCCESSFUL citrus grower at Whittier recently said: "If I were sure we have had our last rain I would turn my cover crop under, but I would prefer to leave it until after the last rain, if we are to have more." And that is the attitude of many, for cover crops are late this year and most of them would be of greater value if they could grow for a month yet.

In order to find out the relative proportion of the several crops used, the writer visited eight orchards in Los Angeles County at each of three points —Covina, Glendora, and Whittier, all showing a good soil cover. The whole 24 were of melilotus. Some orchards had no crop except a volunteer, generally of mallows and nettles, but in a total of about 50 observed all those sown in the fall of 1919 contained melilotus except one, and that one was sown to barley. The amount of seed sown varied from ten pounds to 25 pounds per acre; generally, but not always, dependent upon the size of the trees. One orchardist having a heavy rich soil and comparatively young trees sowed but ten pounds, for many mallow plants were six feet high and other weeds were present in proportion. Ten pounds of melilotus seed was entirely sufficient, but it would have paid the owner had he run over the tract with a mower and cut the weeds down early so the legumes could have developed better.

Malva Makes Good Green Manure

Note by white line the height of the malva. Melilotus is likewise a heavy crop in this orchard.

Value of the Crop

So late is the crop and so copious and sufficient the late rains that the melilotus is doubtless now more than three-fourths water, so that less than 20 per cent of the plant is organic matter. This is representative of the best crops, for where the plants are less succulent the crop is light and stunted, due in most cases to lack of preparation before planting. Where the most thorough preparation was made, there the best crop may be found—always. This is especially marked on the heavier soils where disks did not sufficiently overturn to a good depth.

It is evident that many orchardists do not get full value of the cover crop because plowing is not deep enough. In heavy, close soils after two diskings the melilotus is lying for the most part on top of the soil, chopped up ideally for chicken feed, but neither covered nor incorporated with the soil. One rancher said two more diskings, or four in all, would put nearly all out of sight and the soil would show clean and black. But he is evidently deceiving himself, for sun and wind will soon wither and dry the chopped up plants of 80 per cent water and little would show after the fourth operation, even though lying on top. On heavy soils the single furrow mold board plow is doing the best work and is doing it well.

Do Not Delay

While many are delaying the turning under until the crop "sizes up," those most experienced in citrus growing have already finished the work and strongly advocate early plowing, especially if the cover crop is a heavy one. Early plowing not only makes the crop early available to the trees but time is necessary to get the soil in proper condition for summer's irrigation. A heavy crop turned under late, if not followed by rains, especially in soils well drained, does not augur well for the next fruit crop.

With these late plowers the trouble comes mainly from late sowing and lack of soil preparation before sowing. Melilotus needs about five months to develop in a normal season and as much soil moisture is needed no pains should be spared to put the soil in a receptive condition for the expected rains. On naturally poor or impoverished soils the application of fertilizers at time of planting is advisable, but it is not the general practice. Care in preparing the seed bed will bring a heavy crop and every ton turned under is equivalent to turning under a ton of barnyard manure. The keynote to success, then, is to grow a good crop, and if this may be done by soil preparation no fertilizer amendment is necessary. Whether or not the purple vetch will displace the Melilotus Indica remains to be seen, but it is evident that at present the latter is the best winter cover crop for a wide variation in soils. Yet all should experiment with this promising vetch who can get even a small supply of seed. The practice of summer cover cropping is also rapidly gaining in favor.

ROADWAY PLANTING

Because trees have been set in stiff, exact rows along the waysides for ages, the possibility of there being any different and better way is apparently never even thought of.

Consider nature's way of grouping her trees and plants: there are no straight lines and no uniform and exact spaces between growing things of her setting, and she attains far better and more artistic results in her work than the man with the straight edge and measuring line, and there is no end to her ever changing combinations and artistic effects.

In place of rows set the trees in clumps, as a rule of but a single variety in a clump. Let the clumps vary in size and natural grouping to fit the place, from three to 30 in a bunch; the distance apart of the trees and the number in a clump to depend upon the size and growth, habit of the tree and the distance between the clumps to depend upon the lay of the land, the soil, moisture, exposure, and other conditions.

The grouping of the trees should be the work of landscape artists, the best available. Their work would add much to the beauties of the landscape that took in such roads. Some clumps might extend two or three trees deep into the roadway, and, with the consent and cooperation of the landowner, some might also project back into the fields. Others, like the tall straight lombardy poplar and eucalyptus globulus, would be effective in straight strings of about five in a line. The setting of the stakes for the clumps and for each tree in the clump should be the result of intelligent, artistic consideration given to each particular group. The spaces between clumps should be, probably, from 50 to 200 feet. By this way of treating the waysides much better results can be obtained. The view of the road from a distance would be vastly more attractive, and the view from the roads would be much more enjoyable than to have it alternate every second or two by trees cutting off the view.

The roads would have more sun to dry up the summer as well as the winter rains, which would be an economic feature of importance enough to be taken into account, and there would be numerous shady places under which to alight and enjoy the vistas.

Much more might be said upon this subject, but this is enough to show that this way would be a great improvement.—Monthly Bulletin, California Department of Agriculture.

More Than Anyone Else YOU Need What This Trade Mark Stands For

THREAD-RUBBER W

Because you haven't a battery service station just around the corner to call on in a hurry when things don't go just right—

Because you can't afford to be without your car any more than you can afford to be without modern farm machinery—

Because you operate your car not for pleasure but as an essential to your business and you want upkeep cost as low as possible.

There are a good many other reasons why you ought to be more particular than anybody to see that you get a Still Better Willard with Threaded Rubber Insulation.

Threaded Rubber has this particular advantage over any ordinary insulation: It does not have to be replaced, whereas the ordinary kind is usually replaced at least once during the life of the battery.

The work of re-insulation always means tearing down the battery and pulling out the positive and negative plates. When this is done, the plates may be found to be damaged so that nobody can say how long the battery will last or how long it will serve.

It's easy to do away with this trouble and this chance of shortened battery life by saying "*I want a Still Better Willard with Threaded Rubber Insulation.*"

Ask the nearest Willard Service Station for particulars about Threaded Rubber and what it means in added battery life and better battery service.

Willard Service

Threaded Rubber Insulation performs the important task of separating each positive plate from its negative neighbor, and prevents short circuits which would soon ruin the battery.

WILLARD STORAGE BATTERY

Willard Threaded Rubber Insulation

For Better Tractor Results

DEALERS and tractor manufacturers, as well as farmers, acknowledge this Automatic Engine Disc, the one harrow above all to give you the utmost in tractor farming results.

Built for hard, gruelling work and long years of service, yet it is the most easily controlled disc on the market today.

Gangs are automatically angled by draft of the tractor. Adjustments to suit field and soil conditions made by regulating wheel within easy reach of tractor seat, without stopping tractor.

Once over with this engine double disc and your fields are in prime shape for planting. A time saver and money maker as is every tool that bears the world famous trade mark--"Roderick Lean".

Spring Tooth Harrow

Has heavy, one-piece angle steel frame with extra runner plates to prevent wear, long spring teeth of special steel, and special adjustable tooth fastening device. Good clearance and light draft.

Steel Lever Spike Harrow

The first steel spike tooth harrow ever built, and the best known and most widely imitated. Every ounce of special steel. Every section surrounded by strong channel steel frame, braced at two corners and center. Cannot twist.

If your dealer cannot show you the automatic, write us for full information and the name of nearest dealer handling it.

Roderick Lean Mfg. Co.

Builders of the most varied line of harrows in the world, including a complete line of spike and spring tooth harrows.

"New Century" Single Disc

Furnished in any size from 4 to 10 feet. Strongly built and braced. Has working features not found on other single discs. Flexible trailer can be furnished in 5, 6, 7 and 8 ft. sizes

"NEW CENTURY" ENGINE DISC

Furnished in 5, 6, 7 and 8 ft. sizes for use with lighter tractors. Built extra strong for power use. Operated from tractor seat by two levers within convenient reach. Adjustable hitch suits any standard light tractor.

MORE SCARED THAN HURT, BUT HURTS JUST THE SAME

(Continued from Page 527.)

the many centuries that olives have been used and we may safely assume that it will never occur again from the use of ripe olives, because the germ responsible is very rare and because the packers have taken steps to prevent a recurrence of the Eastern cases. Professor Bioletti has made a calculation based upon the ripe olive output of California and the known number of cases of botulinus poisoning from olives, and finds that one would have to eat one quart of olives daily for 3,000 years to even have a slight chance of being poisoned. In other words, commercially canned or bottled ripe olives are as safe as any canned food and safer than some home canned fruits. Cheese has been responsible for a number of fatal cases of botulinus poisoning, and sausage is a frequent carrier of this poison. If we are to continue eating at all we shall have to take a slight risk of an unexpected and painless journey to the Great Beyond through eating food containing the botulinus toxin, because practically any food product may contain this toxin under suitable conditions.

"This poison is formed by a germ known as Bacillus botulinus, whose exact habitat or origin in nature is unknown. It has been known to occur on fruits and vegetables, but fortunately very rarely, and is also known to form spores which are extremely resistant to heat. These spores correspond in germs to the seeds of higher plants. Under certain conditions, such as in vegetable canning in the household, these spores will withstand three hours boiling and still be active enough to germinate in the jar of vegetables and produce the toxin. In fruits, however, the spores are easily killed if the fruits are sterilized in the jars in boiling water for 20 minutes, because the fruit acid aids sterilization. It is only improperly home canned foods that are dangerous and even from these it can be seen that the danger is very slight when one considers the billions of cans of canned foods used annually without injury to health. The writer feels that the present hysterical fear of canned foods existing in certain localities is entirely unfounded, and believes, further, that the use of canned olives or other canned fruits is no more dangerous than riding on a street car. Nevertheless, this fact should not prevent our taking every precaution to prevent poisoning from botulinus toxin.

"The bacillus (germ) itself is not infectious and cannot grow in the animal body. It is only the poison formed by this organism under anaerobic conditions (i. e., in the absence of air) that is dangerous. The poison is easily destroyed by heating the canned product to boiling after the can or jar is opened for use.

"Thus we have two methods of eliminating the even remote possibility of this type of food poisoning. We may kill all of the spores of the bacillus (should by any chance they be present) in the can or jar of food by thorough sterilization at the time of canning; or we may boil the food before use to destroy the toxin (poison). In practically every case, so far reported, the infected can or jar of food has given off a sour or rancid odor when opened. Such food should, of course, never be used. In cheese and sausage the presence of the toxin is not so easily noticed.

Prof. Cruess then gives information as to gathering, pickling and details as to factory methods. Touching upon sterilization, he says:

"The sorted and graded fruit is filled into cans or jars by weight. A dilute brine (2½ to 5 per cent salt) is added. Cans are exhausted by passing them through a steam box at 185 degrees Fahrenheit to 210 degrees Fahrenheit. The heated cans are sealed in sanitary can double steamers. Jars are exhausted and sealed under special vacuum sealers.

"The sealed containers in nearly all factories are sterilized in large steam pressure retorts at 225 degrees Fahrenheit to 240 degrees Fahrenheit, temperatures well above the boiling point of water and which are high enough to insure thorough sterilization. A few factories use boiling water for sterilization, but for a period of time several times greater than that given any other canned fruit.

"Erroneous statements from various sources have appeared recently in the press to the effect that canned olives are not heated. This statement is at variance with the facts. Ripe olives are sterilized at high temperatures."

LAND SETTLEMENT PLANS AT DELHI

(Continued from Page 529.)

might well be administered by ex-service men only.

"Another proposed amendment which I hope will not prevail, would make this act apply to soldiers only. Nothing could be more unfortunate than to narrow the operation of the act from its original purpose. It was passed in the first place as a means of lessening the growing dangers of tenantry, to help keep boys and girls on the farm, to introduce cooperation and a better social life in country neighborhoods. The results at Durham show that all these benefits can be secured. The causes that led to the original act still exist. Ex-service men will be numerous and valuable members of these neighborhoods, but the door of opportunity ought not to be closed on the girls and boys who are coming into womanhood and manhood and which the state will need on the farms. This act ought to remain what it is now, a beacon of hope to every industrious and aspiring person who is willing to pay to the state every dollar it spends to help him. If it is to be kept on that basis, there is no limit to the amount of money which the state can safely and profitably expend and no cause to limit the number of people that should be and can be helped. We will have better country neighborhoods if the test is the fitness of people to make the cost of the soil and climate and to build up there a sound and progressive rural life. The land settlement board feels and has declared that if he is a good farmer he will be given a preference because he was a soldier. But if he is not a good farmer he should not be given such preference.

"I have written quite fully about this because I believe the Legion has before it a great opportunity to strengthen the movement begun in this state to create here a high rural civilization and to relieve the state of certain things that menace rural life all over this country. The operation of the California Land Settlement Act has already been an incentive to other states. Since it was adopted, South Dakota has passed, and has in operation, a similar act. The governor of Kansas hopes to secure the enactment of one at the next session. The Legion can best serve the state and the interests of its own members by broadening the scope of this act rather than through its restriction."

AMERICA'S PLACE IN FARMING

The American farmer leads the world in individual production of crops. Belgium and some of the countries in Europe where intensive farming is practiced exceed America in the yield per acre. Each American farmer, however, produces two and one-half times as much actual food as does the Belgian farmer; two and three-tenths times as much as the British farmer; three and two-tenths times as much as the French farmer, and three times as much as the Italian.

Our broad acres furnished the incentive to American ingenuity in the development of labor saving farm machinery. These machines used on our vast stretches of rich land make it possible for America to excel in the production of food per man. It is likely that America will always maintain her lead in production per man because of soil and social conditions.

As the population of America increases the production per man will undoubtedly become smaller, but the production per acre will become greater. It is even possible that America may at no distant date approach the Europeans in the yield per acre, and at the same time keep the size of farms sufficiently large to warrant the employment of labor saving machinery, thus making certain our continued lead in production per man —Nebraska Farmer.

5 Things Worth Remembering about a MAXWELL Truck

1. It has a worm drive, which is the predominant feature of most worth while trucks.
2. It hauls 1½ tons; 75% of all loads carried by horse or motor are 1½ tons or less.
3. It uses less gas and oil hauling a peak load than many trucks use with no load.
4. It is very simple in design (more brains than metal have been used in its construction); it travels faster than a larger truck. 16,000 have supplied abundant evidence of its economic transportation.
5. A comparison with other 1½ ton trucks shows a saving of $300 to $400 in the original investment in a Maxwell.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

ARISTOCRATIC

Potatoes have now joined the aristocracy. In the stands they are arranged alongside oranges and apples—"Five cents each. Take your pick."

A REAL RAIN

"Now is the winter of our discontent made glorious summer" by the finest and largest rain of the season.

It has been spotted, at times raining heavily in some places and not at all in others, but sometime during the storm every section of the state has had its drenching. The clouds are still promising, and already since the storm began on Saturday there has been precipitated between two and three inches in producing sections. The fall of snow in the mountains has also been extremely heavy, and it is hoped the power shortage will be relieved.

TAXES

Second, or final, payment on our tax for the support of the counties will soon become delinquent, and this, in connection with the income tax just paid. helps to remind us that government appeals for greater thrift—personal thrift—may well be supplemented by county, state and national thrift. If it's well for the farmer to let the hired man go and put in a few extra hours of hard work, it is well for some of the useless tax eaters to be passed on to more productive jobs.

Meantime, there is another tax, with some—a very few—payable the year round—"Idleness and pride tax with heavier hand than kings and parliaments."

CONSUMERS TAX

Consumers are watching with no little interest the effort in Washington to repeal the income tax law, or at least the excess profits portion of it, and put the entire burden on the consumer. The claim is made by friends of the movement that the manufacturers and dealers place on goods a price sufficiently above cost so that the consumer is forced to pay the excess profits tax in any case, and in order to cover with safety they are inclined to allow altogether too wide a margin. However, the consumer prefers to take his chances and let the excess profits care for themselves rather than have the entire cost put upon matches at one cent per hundred and other articles in proportion.

HOUSE THE IMPLEMENTS

Only a short ride on California good roads is necessary to convince even the casual observer that Californians as a rule do not give sufficient attention to machinery and implement conservation. Time and again we have seen the harvester, and even sometimes a combined harvester and thresher, standing in the field where left nearly a year ago. Cultivators, plows, even tractors, are often given similar treatment. They are heartless things and have no nerves, but today's prices make their preservation necessary. More farmers should consider the wisdom of shed room to protect implements when not in actual use. Besides, overhauling, cleaning and repairing is made possible on rainy days.

SUPPORT LOCAL PAPERS

If our readers will pardon the hint—which isn't strictly agricultural—we would like to say one word in favor of local country papers of California.

The man who buys white print paper these days on which to chronicle the events of the community and aid in its upbuilding has a problem which calls for hearty support if it is to be solved. White print is not only enormously high in price, but at times next to impossible to secure. Ink, type, labor—but we need not go farther—it is the same old story, only it is especially aggravated in the printing trades. The large city papers, and possibly the farm papers, are giving service for a lesser sum than the local papers can possibly do it, but the local paper is essential to the welfare of every community.

DAYLIGHT SAVING

Again the question of daylight saving is causing contention between the city folk and rural folk. Congress revoked the daylight saving enactment so that nationally it is presumed the question will not come up again this year. It will be recalled that the first bill repealing the former daylight saving law was vetoed by the President and later passed over his veto without any particular effort. This because of the campaign which had been originally made by farm organizations of the Middle West.

But a peculiar situation confronted California when it was feared the water shortage might call for every possible saving of electrical power. Gov. Stephens expressed himself as in favor of saving, if possible, by pushing the clocks ahead one hour. But this is calling forth more opposition than was shown by California producers under the national enactment. Now the farmers are making appeal to those who wish to save one hour of daylight to do so, but to leave farming operations to be conducted, as they necessarily must be, according to the time arranged by Old Sol.

GROW SORGHUM

Sugar is still up; it is going to remain up; at least, our guess is that we will never again be tiring our arms with lugging home 20 pounds of sugar for which we paid one dollar, excepting in memory, as we sing, "Them Was the Days." The American's sweet tooth is well developed and must have the sweet. Why not grow it ourselves? The sweet sorghums offer the opportunity. They grow to perfection in California, and now comes the cooperative sorghum syrup mill.

The home supply can be secured in this way and the market built up for special trade in jugs of sorghum molasses. Some don't like it; more do; in any case it is a good, healthful sweet. Sorghum growing is having a real revival in many Eastern points. The extension service of the Minnesota agricultural college is urging more general planting and giving suggestions for establishing cooperative factories. The first point in starting a cooperative sorghum syrup industry is an assured acreage.

ORDER OF MERIT

Americans are a bit inclined to decorate with medals, badges and ribbons and to pay great honor to the winners. One of the departments at Washington is in fact accused of being rather free, or, again, rather close, in giving out medals for war services—the freeness or closeness according to relationship or viewpoint. But if medals are in order it seems to us the French have a fine custom of conferring recognition on persons who have distinguished themselves in agriculture. Those who have conspicuously aided progress in agricultural practice are awarded "The Order of Agricultural Merit." There is one objection to the French custom, however, and that is that a good stiff fee seems to be necessary to secure this decoration. We have heard no charge made, however, that the awarding commission is influenced by this fee.

In America the University of Illinois has what is known as The Hall of Fame, in which portraits of great agriculturists are displayed. A national badge has been suggested but never as yet accepted. Meantime the American farmer is doing pretty well without any decorations.

WHY UNIONIZE THE FARM?

The labor union is making another effort to induce farmers to affiliate with it in order to make more effective the demands of farmer or laborer. In urging the wisdom of the step in an article in The American Federationist, Samuel Gompers says:

"The strike is a right which must be maintained by the workers of the United States in the interests of human progress. It is a right which must be maintained for the progress of the farmers as well as for the progress of the workers in mills, mines and railroads." "The strike is a resentment against the imposition of tyranny and injustice."

This latter statement may have been true in certain instances; there have been other instances, however, where strikes have resulted in the imposition of even greater tyranny and injustice.

Since the strike of the Boston policemen where unionism proved stronger than loyalty and the oath taken by officers to enforce the law was set aside by the oath to stand by the union, strikes have not been in good form in the United States. In addition, they are proving, as they always have, desperately expensive, not only to empolyer and empioye, but more so to producers who have goods to market, and in the final payment of bills the consumer gets his share. It is a fearfully expensive method of settling quarrels.

The farmer is not taking a hand at that game.

EAT MEAT

On Monday begins Meat Week. It is not to be a week's campaign to induce greater consumption of meat so much as to induce consumption of the cheaper cuts of meat. The department of justice at Washington, D. C., has issued this statement: "The department feels that this campaign, while undertaken primarily in the interests of the consumer, will also be beneficial to the livestock producer by broadening the demand for all parts of the meat animal. As you know, there is a large group of persons who, when the price of choice cuts of meat goes very high, reduce their consumption of meat instead of turning to the less expensive cuts. This checks consumption, which in turn checks production."

The present week, March 22-27, is Meat Week in New York, Pennsylvania, Ohio and other states as far west as Iowa. Next week, beginning on Monday, March 29, will be Meat Week in Maine, Vermont, Connecticut, New Hampshire, Rhode Island, Massachusetts and the three states bordering the Pacific. The following week, beginning April 5, will be observed in Missouri and other Southeastern states, while other Southern and Middle Western states end the campaign the week beginning April 12.

Why the department of justice enters into this campaign we are not fully informed, but so long as it is making a good fight in a good cause, here is welcome. It is very probable that the fierce campaign made during war days against consumption of so many things that were really liked has started a habit which has induced us to refrain from normal consumption of some of the most healthful of foods. Meat is healthful; it is energy giving and it is right that all should encourage the industry which at this moment is in a trying situation. Europe is finding American goods at American prices altogether too high, and staples which were shipped across the Atlantic are now being reshipped and sold at prices higher than can possibly be secured on that side of the water. Besides, for years long before the war all Americans have been almost a unit in demanding the higher priced cuts. There is as much nourishment and, properly cooked, as much satisfaction, in eating some of the more common cuts. We may well try it for one week, at least.

From Seed to Feed

By Ernest Braunton

WHEN cotton is ginned there is removed from the seed all that the grower wishes to sell as staple cotton. For though much lint still remains clinging to the seeds, it is so short that were it included it would reduce his cotton to second grade. So after the gin separates the seed from the lint the grower hauls his cotton away and sells the seed to the gin, for it cannot be profitably handled in less than carload lots.

Nor do the seeds long remain at the gin for no equipment is there to use them in any way whatsoever. They are sold and shipped to the mills, to be converted into cottonseed oil and oil meal, and the raw hulls are sold for stock food before being processed in any way except to clean them of dirt and rubbish. The seed itself goes through some interesting changes before it reaches the consumer, one part of it going to feed the human family and the other for consumption by the lower animals.

At the Mill

When the seed arrives at the mill each car with its contents is weighed and unloaded into screw conveyors which force it to the top of gigantic storage warehouses where it is piled 40 feet high. It is then fed to cleaners that remove sticks, dirt and other debris, after which it is run through the linters and fairly cleaned of the lint or cotton adhering. These cut from 70 to 125 pounds of lint from each gross ton of seed. This by-product in times of war went to make ammunition; in times of peace it is made into mattresses. Thus on November 11, 1918, it passed from the explosive action of war to the somnolence of peace. To the curious it may be stated that gun cotton, a high explosive, is made by drying this cotton at 100 degrees and soaking it for 24 hours in a mixture of one part nitric acid to three parts of sulphuric acid, cooled and washed with water.

In the oil mill the seeds are hulled and broken and the meats separated from the hulls. The hulls go into storage for the time being or may be shipped direct to stock yards or dairies for feeding to cattle or other domestic animals. The meats pass on to rolls such as are found in all roller flour mills and are ground to powder or flour. This finds its way into steam kettles, where it is warmed and moistened for one hour and is then formed into cakes an inch or two thick, one foot wide and two feet long, wrapped in mats of camel hair cloth and put into presses. These presses subject the cakes to a pressure of 2,500 pounds to the square inch and the oil fairly gushes out.

Oil Leaves Mill

The oil is then shipped in tanks to the refinery and after refining goes into salad oils or compounds, being put to various uses. But the cakes remain behind and as they dry become so hard that they cannot easily be broken by the hands, for the pressure undergone was sufficient to solidify anything possessed of adhesive properties. These cakes are thrown into crushers similar to rock crushers and broken into pieces less than an inch square. These are in turn fed into the grinding mills and come out as cottonseed meal, a stock food high in protein and much in demand at both fattening stalls and dairies. In feeding cattle this meal is often mixed with cottonseed hulls for roughage, generally 25 or 30 pounds of hulls to six pounds of meal. The hulls hold the meal in better distribution than bean or cereal straws, being "woolly," while the latter are smooth and glassy and allow the meal to slip through to the bottom of the feed trough. More than two-thirds of the value of cotton seed lies in the oil, the remainder in lint and foodstuffs for livestock.

Interesting Figures

In a food survey published by the federal government it was shown that on the first of January, 1918, there were 34,383,879 gallons of cottonseed oil in the United States. For comparison, on the same date we had 3,921,877 gallons of olive oil. In 1917 there was much more cottonseed oil and much less olive oil.

In "Feeds and Feeding," by Henry and Morrison, the digestible nutrients in 100 pounds of cottonseed meal is given as follows: Crude protein, 38.4 pounds; carbohydrates, 24.3; fat, 7.9; total, 80.5. In 100 pounds of cottonseed hulls: Crude protein, 0.3; carbohydrates, 33.3; fat, 1.5; total, 37.0. Little cotton seed is fed before the oil is extracted, both on account of the value of the oil and because cottonseed meal gives better results. The cake is often fed finely broken in bits, especially out of doors, where the meal would be blown about and scattered by the wind. Care should be taken not to feed cattle too much cottonseed meal or for too long a period, but mix well with other foodstuffs, though it is one of the most valuable and most economic of stock foods.

The writer is indebted to T. W. McDevitt and J. P. Conduit of the California Cotton Oil Company, Los Angeles, for the courtesy of a "personally conducted" trip through their oil mills, which have a capacity of 120 tons of crude cotton seed per day.

IF YOU—CAN

Young Hopeful (to his sister): "I say, Nell, pass me the butter."

Nell (in a ton of sisterly reproach): "If what, Johnny?"

Johnny (goaded to desperation by the delay): "If you can reach it."

MOTOR TRUCK BIG FACTOR IN MODERN FARMING

ucts, for the establishment of satisfactory rural schools, and for the development of a richer and more attractive rural life. Recognizing these facts the federal government, through the passage of the federal aid road act in 1916, inaugurated a policy of direct financial participation in road building operations in the various states. This act appropriated $75,000,000, to be matched by an equal amount from the states, for the construction of rural post roads over a period f five years, and $10,000,000—$1,000,000 a year for ten years—for roads within or partly within the national forests."

After the Cutworms

By L. V. Bonner

WITH the renewal of the activity of the vines the grape grower must again pay careful attention to them in order to obtain a maximum crop. As soon as the vines are starting to sprout or sometimes even before the buds are swelling they are susceptible to attack by cutworms. When the worms are very numerous and the vineyard very cleanly cultivated so that no weeds are available for the pest, the hungry worms climb on the vines to eat the soft tissues that can be found. Sometimes the buds are destroyed before they swell and the damage is not seen until late when the vines sprout very irregularly. The damage caused by such an early infestation is considerable, as most of the buds fail to grow at all. So where cutworms are present every year it is very important to watch them about the time of sprouting of the vines, especially when the soil is without weeds. The injured buds show a small hole and when cut through the middle the tender central part has entirely disappeared.

If the attack occurs at the time of sprouting, it is more easily detected than when it happens before, but the loss of crop may also be serious.

Severe attacks are periodical. The cutworms seem to increase slowly in number for two or three years, when suddenly they appear in large numbers, causing great damage to vineyards. Then they disappear naturally through the parasitism of small insects or perhaps also because of insufficient development resulting from scarcity of food.

The methods of control are varied. As the cutworms do not feed ordinarily on vines and when weeds are abundant the damages to vines are negligible an apparently logical method of preserving the vines against the attacks of cutworms is to grow a green manure crop in the vineyard until late. This method appears very promising from the two points of view of preventing injury to vines and of increasing the humus content of the soil. In localities where there is plenty of water for irrigation, this method can give good results.

When an infested vineyard has been cultivated in the winter and no weeds are present, it is necessary to combat the pest by direct means. In small vineyards traps consisting of small boards or flat stones can be placed on the ground around the stump of the vines. Cutworms will hide beneath them during the day and it is easy to kill them. In large vineyards poisoned baits are used and may be supplemented by arsenical sprays. A satisfactory poisoned bait is made as follows: 40 pounds of bran, two gallons of cheap molasses and five pounds of arsenic. A sufficient quantity of this bait should be put right at the base of the stems to encircle them.

When the vines have sprouted an arsenical spray can be used with advantage. Five pounds of lead acetate to 50 gallons of water is a good formula. Paris green at the rate of one pound to 75 gallons of water is another efficacious spray.

Water, Power and Prosperity

ALL of California is asking: "How are we going to do it?" The opportunity is here for the state's greatest crop production, but there is one serious handicap—so serious, in fact, that it appears it will be almost impossible to overcome. Still, the state has been forced to solve bigger problems.

Gravity water from the hills will flow less freely this season, and this means not only direct loss of irrigation waters but loss of power to lift other water from the gravel beds.

We cannot create, but we may at least conserve. Every suggestion along this line is worth considering. Here are some so valuable, by I. W. Alexander, in the recent issue of the Associated Grower, that we present to Cultivator readers:

* * *

By I. W. Alexander

In view of the present short water conditions as the result of three years of less than normal rain and snowfall it is interesting to survey the economy that is practiced by hydro-electric companies in the use of water and the huge benefits that result.

The tremendously increasing demand for electricity throughout the San Joaquin Valley, and the entire West for that matter, is spurring the big power companies to mighty development efforts that would have been undreamed of a few years ago. The gigantic project of the San Joaquin Light & Power Corporation on the North Fork of the Kings River, which will develop more than 300,000 horsepower by means of reservoiring in the higher altitudes, and the additional development of the Southern California Edison Company on the South Fork of the San Joaquin River, are two striking examples at our very door.

These big developments will be a blessing to the public. First, because of the additional electric power to be developed; secondly, because they are performing a valuable public service in the conservation of waste waters during flood seasons for use at later times when badly needed for irrigation. A double economy and conservation is performed in this respect. At the time the proposed great gravity irrigation projects will be in need of their reserve water supply the power companies likewise will be compelled to operate to capacity. This will mean the releasing of the stored up waters in the higher altitudes for the generating of electricity. Once released the waters pass through the several power houses, thence back into the river channel and on to the lower elevations for use in gravity irrigation.

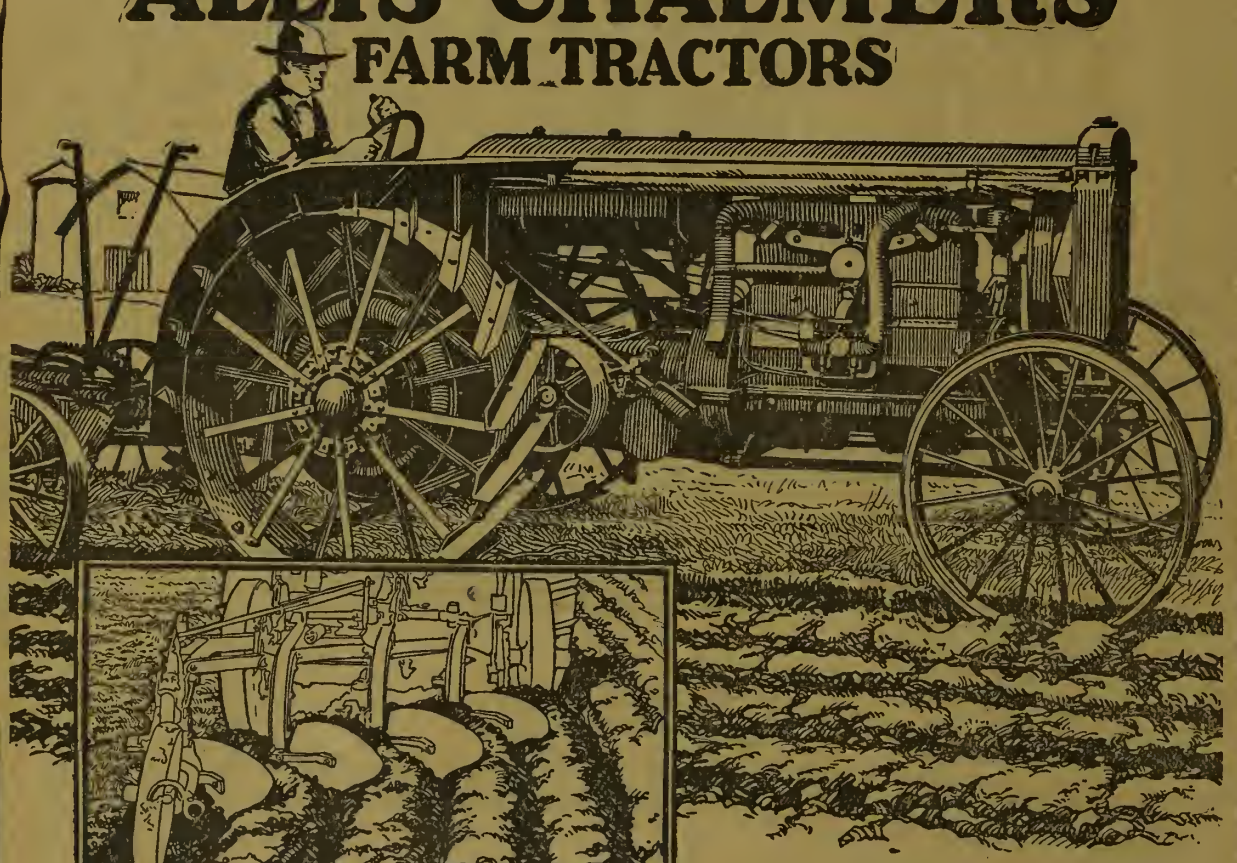
Electric pumping and gravity irrigation will go hand in hand in the ultimate development of the San Joaquin Valley. One will not perform its maximum service without the other, and together they will enable the conservation and utilization of the water supply of this great valley to its fullest extent.

All of the tremendous hydro-electric developments now in progress or under contemplation provide for the reservoiring of the flood waters in the higher mountain elevations, much farther up than the locations at which gravity irrigation districts only can with profit reservoir. This, of course, will enable the ultimate conservation of far more water than if the irrigation districts alone were commissioned with the reservoiring. This additional stored water will be released during the low water periods, when electric power is needed and when additional water is needed for gravity irrigation.

The passage of water through the electric power generating plants does not diminish the supply of water. It is returned to the river channel in its original quantity, after having produced the power that is transmitted over miles and miles of slender copper wires to light our homes, propel our street cars and elevators, cool our rooms, cook our meals and, the most important of all, raise to the surface of the earth again, for purpose of irrigation, the very same water that has heretofore made all this possible.

In the final performance of water conservation and irrigation, gravity systems will irrigate the lands along the higher levels; pumping will be resorted to to put the water upon the lower levels. This will enable a double service with the same amount of water and further enable the reclamation of thousands of acres, at present water logged, by the readjustment of unequal water levels that will be brought

ALLIS-CHALMERS
FARM TRACTORS



16 Acres a Day—10 Hours Work

Owners of Allis-Chalmers 18-30 Farm Tractors are reporting 2 gallons to the acre kerosene consumption plowing 16 acres a day with four 14-in. bottoms.

Where disc plows are used the 18-30 pulls six discs.

Fuel and oil costs of 35 cents to the acre are reported from many sections.

One distributor canvassed 35 owners of the 18-30 and received a 100% rating for economy—efficiency—service—cooling.

These facts are more important to you than all the specifications we could give or all the claims we could make.

They prove that the Allis-Chalmers pulls four plows cheaper than most others pull three—and does 30% more work.

5 Acres a Day With the 6-12

Where a one man tractor is wanted—the Allis-Chalmers 6-12 will turn over 5 acres a day pulling two 12 in. bottoms—it will pull two 24 in. discs.

The operator sits over the implement or on the implement seat with any standard implement.

Clearance is 26½ in. for pulling two row cultivator.

The 18-30

3000 pound draw bar pull at high speed of 2.8 miles an hour.
30 H. P. at the belt.
20% surplus power over rated capacity.
Removable cylinder sleeves.
Allis-Chalmers Radiator, fin and tube, extra large capacity.
Extra large water jackets.
Double bowl, kerosene burning carburetor.
Force feed lubrication with sight feed lubricator.
Magneto ignition, impulse starter.
Allis-Chalmers Centrifugal governor.
Allis-Chalmers expanding shoe clutch.
Allis-Chalmers transmission, special heat treated gears, two forward speeds.
Allis-Chalmers rear axle and enclosed gear final drive.
Transmission brake.
Adjustable, swiveled draw bar.
All working parts dust proof.
Connecting rod bearings easily reached through large hand hole plates in motor base.
Three point suspension with hollow square, pivoted front axle.
Frameless construction, with steel motor base, clutch and transmission housing and rear axle housing firmy bolted together.

The 6-12

1000 pound draw bar pull.
12 H. P. at the belt.
Belt pulley removable when not in use.
Allis-Chalmers fin and tube radiator.
Magneto ignition.
All parts readily accessible.
Adjustable hitch for any standard implement.

Allis-Chalmers Manufacturing Co., Tractor Division, MILWAUKEE, WISCONSIN

For 65 years known as one of the largest manufacturers of high grade machinery in the world.

about ultimately by increased surface pumping.

In pumping territories more attention will be devoted in the future to the planting of crops that will return the greatest income for the cost of production. Pumping of water for alfalfa growing is many, many times more expensive than the cost of pumping for fruit growing, because on the average four times as much water is required to irrigate alfalfa. Furthermore, the return per acre on such high class products as grapes, raisins, table fruits, dried fruits and vegetables is as much as five or six times, and there are cases of it being ten times, greater than from alfalfa. Therefore, anyone growing alfalfa in a fruit country is unquestionably wasting his time and valuable water. Educational methods will correct this condition and at the same time perform a valuable public service in conservation.

OAK ROOT FUNGUS

New South Wales has her sorrows with Armillaria but is finding partial relief in iron sulphate. We note in the Agricultural Gazette:

"A treatment which is claimed to have saved many apple trees from armillaria is practiced by Messrs. Sim of Capertee. The fungus, it may be remarked, will sometimes remain about the roots of a tree for a long time before it makes sufficient inroads to produce marked manifestations in the tree of its presence. The ingredient used in the protective treatment referred to is sulphate of iron, in the proportion of one pound to two gallons of water. The orchardists above mentioned replied to an inquiry from the department as to the application of the treatment as follows:

"The quantity applied to the trees depends upon the area affected. Our method is to bare the roots, scrape the affected parts and pour on the solution from a watering can. In bad cases the soil in the vicinity of the parts attacked is saturated as a safeguard against reinfection. A gallon of the solution may be necessary in a severe case and its use would be in no way harmful to the tree."

INVENTORY IN MAKING INCOME REPORT

From various and seemingly authoritative sources many farmers have received the information that they are not allowed to use their inventories in making their income tax report. This apprehension should be dispelled at once. The rulings are very plain on this point. The farmer who takes an inventory of his livestock and crops at beginning and end of the year can and should use it in making his report, says W. E. Foard of the University of Missouri college of agriculture. The inventory value of all livestock and crops on hand at beginning of year (January 1), plus all farm expenses for the year, should be subtracted from the sum of all farm sales and inventory value at end of year. The difference is net income. From net income the farmer takes personal exemptions and church contributions to find the income on which he is to pay tax. Inventories should be taken now and dated January 1 in order to start the year 1920 aright.

By figuring income on the inventory basis, one gets around the difficulty where two crops may be sold the same year, thereby instead of having to record two years' income in one, it properly distributes the income in the year in which it was actually made. This principle holds true for stock that may be carried over from one year to another. The inventory method protects the man who may have a sale and sells off a lot of livestock and feed. A man will pay $210 more income tax on $8,000 income when this is all paid in one year as compared to paying on $4,000 for each of two years.

A farm record properly kept will save the farmer many times its cost in income tax alone because the inventory and record will reflect the proper income. Without the record the farmer will almost invariably report an income larger than he really has. Get a farm account book now and start your record for 1920.

Traveler, in country store—"What have you in the shape of automobile tires?"

Clerk—"Fresh doughnuts."

Cletrac
TANK-TYPE TRACTOR

For Every Purpose

Put a Cletrac on the job. Sturdy, powerful, rugged and sure-footed, Cletracs are the ideal all-purpose farm tractors. Easy to run—working every day, 24 hours a day if necessary. Lays its own endless track. Travels lightly over any surface, no matter how soft or slippery, with a strong, steady pull and without packing the soil.

The Cletrac operates perfectly and economically on "gas," distillate or kerosene. Costs less to operate than any similar power unit or the six to eight horses it replaces.

The Cletrac's widespread popularity has led to a bigger output and lower manufacturing costs. The result is our offer of an *improved Cletrac with a larger motor, an 8-inch-wide single-grouter track, an exclusive steering device and a special water clarifier, at a reduction in price from $1585 to $1395 F. O. B. Cleveland.*

Take the Toil Out of Ditching

When carried on in the usual manner—plow, scraper, pick and shovel—ditching is a tough job. Many thousands of the country's best farmers have found an easy, quick and economical way. The purpose of this ad is to get in touch with those who still dread the job.

The "MARTIN" is the easy way

It does the work of many men; it does a better job in far less time. It is a simple, all-steel, reversible and adjustable implement, built to last a lifetime. Works in any soil, wet or dry, hard or soft, on hillside or level. Has many other uses other than ditch-making and cleaning.

Horse and Tractor Sizes Catalog, with full particulars, sent free. It contains a wealth of information on better ways to ditch. Address

Hoover on "Agriculture" and "Industry"

THE outstanding feature of civilization during the last century has been the increasing growth of industry as distinguished from agriculture. Many states have stimulated this side of national life until they have built up their populations far beyond the capacity of their land. We have the most profound instances of this in England and Germany. In these states the population is today dependent upon the import, mostly from overseas, of from 30 to 70 per cent of different food commodities through the exchange of industrial products. The very life of their people is thus dependent upon maintaining open the free access to overseas markets. From this necessity have grown the great naval armaments of the world and the burden that they imply on all kinds and classes of population. Such nations of necessity have engaged in fierce competition for markets for their industrial products. They have thus built up the background of world conflicts. The titanic struggles that resulted have endangered the very lives of their people from starvation. Their war tactics have in large degree been directed to strangle food supplies.

One other result of this development has been the terrible congestion of populations in manufacturing areas. All such congested populations are periodically subjected to low standards of living, of housing, and other conditions of life that make for physical and moral degeneration. In times of industrial prosperity the standard of living increases in these manufacturing areas, but in times of industrial depression they only maintain themselves by the practical sweating of the workers. Beyond this there is another jeopardy which has received too little attention; in times of industrial depression, whether brought about by war or by the ebb and flow of world prosperity, these populations, oppressed with misery, turn to political remedies for matters that are beyond human control. They naturally resent the lowering of their standards of living and they inevitably resort to industrial strife, to strikes, and disorder. Their productivity, upon which the very life of the nation depends, again decreases, and their ability to buy food from abroad decreases in train with their fallen productivity because they decrease the production of goods to send in exchange. One other result of large industrial development is that in times of industrial prosperity when the standard of living rises in general industry it attracts into its radius the agricultural population and immediately creates inroads into agricultural production. To some extent this is a natural balancing of forces which tends to stabilize itself in time. But there are social and political phases more important than sheer economic balances.

Years ago our predominant export was food. Then we turned to importing mouths for an expanding industry and our net export food surplus diminished to a low ebb until the beginning of the war, when it received a special and temporary stimulus. By and large our industries have been in a high state of prosperity. More favorable hours, more favorable wages, are today offered in industry than in agriculture. The industries are drawing the workers from our farms. If this balance in relative returns is to continue we face a gradual decrease in our agricultural productivity. If we should develop our exports of industrial commodities during the next five years as rapidly as we have during the past five years we shall by that time be faced with the necessity to import foodstuffs.

Some economists will argue, of course, that if we can manufacture goods cheaper than the rest of the world and exchange them for foodstuffs abroad, we should do so. But such argument again ignores certain fundamental social and broad political questions. These dangers have become more emphasized by experience of the war. From dependence on overseas supplies of food, we shall, by the very concern that will grow in the public mind as to the safety of these supplies, soon find ourselves discussing the question of dominating the seas. Our international relations will have become infinitely more complex and more difficult. Unless the League of Nations serves its ideal we shall have to burden ourselves with more taxation to maintain great naval and military forces. But of far more importance than this is the fact that the social stability of our country and the development of our national life depends upon our farms and villages. These are the sources that have always supplied our country with its true Americanism, its new and fresh minds, its physical and its moral strength. Industry's real market is with the farmer; it benefits by an increase of his standard of living. We want our exports to grow in exchange for commodities we need from abroad, but we want them to grow in tune with our social and political interests, and to do so they must grow in step with agriculture.

Therefore, when we sit down to consider our reconstruction policies from the war, when we sit down to plan the future development of our country, our first thought should be of the state of our agricultural industry. For the last three months I have been a member of the Industrial Commission at Washington, endeavoring to find some solution for the conflicts and social wrongs that have grown up in our industrial community. Great as is the need for constructive thought with regard to its weaknesses the need for similar thought and similar activity is still greater with regard to agriculture.

The prime problem is to make the agricultural industry economically attractive so that it draws into its service its full proportion of American life, so that it can keep pace with industry in its rapid development. When we come to the consideration of practical measures we soon arrive at two primary facts. The first is, the farmer's main production must find its market either in the great industrial centres along the Atlantic seaboard or, alternatively, in export to Europe. In either case the prices in normal times are made primarily by competition with the other great sources of the world's food supply. His prices are thus only remotely regulated by the cost of production. Strict economists will argue that if the prices are unprofitable to the farmer this will ultimately correct itself by diminished production and consequent general rise in the world level of prices. Amid the complex flow of economic forces today these results come very slowly and in the meantime the actual result is mainly a decrease in the standard of the farmer's living. For the farmer must plant and gamble in advance on the demand. He cannot decrease his production to meet such contingencies with the facility of organized industry. Whatever the economic argument may be the outstanding fact is that for all practical purposes the farmer's level of prices is made by the world prices of food as interpreted at the point of delivery, and during wide periods of time he is underpaid. On the whole he has not been underpaid during the war, but recently the tide has begun to turn against him.

The second great fact that would be developed is that the American farmer receives a less proportion of the consumer's purchase price for his product than the farmer in most other civilized countries; that is, the margin between the farmer and the consumer is the widest in the world. This margin comes partly out of the consumer but predominantly out of the farmer, for, as I have said, the prices to the consumer in the great food commodities in normal times are fixed by world forces. If we assume the basis of price is not to be remedied the line of practical remedy to the farmer lies in decreasing the cost of placing his products into the hands of the consumer. Every cent that we can decrease this cost contributes to the consumer, but even more largely to the farmer.

If we analyze the weaknesses of our system of distribution we can for purposes of discussion divide it into three phases: transportation, manufacture

From Nothing to Independence
In Less Than 5 Years
In Northern Imperial Valley

W. H. Young, of Calipatria, four years ago had difficulty in securing groceries. Today his financial statement shows upward of $70,000. He has made his money by farming the same kind of land we are now offering for only

$90 to $175 Per Acre
(On Easy Terms)

Water Stock—$20 per acre, payable $5 down and $5 annually or $17.50 per acre cash

These lands are ideal for long-staple cotton, now worth about $1.00 a pound. They are also unexcelled for grapefruit, winter vegetables, cantaloupes and field crops. The water supply is adequate and everlasting. Our farmers know no drouths.

Another Typical Example of Farming Success

John T. Collins arrived in Calipatria 5 years ago with a few hundred dollars. Today he is worth between $50,000 and $60,000. Collins, too, has made his success because of the unequalled growing conditions, inexhaustible soil and plentiful water supply that have "Taken the Gamble Out of Farming" in Imperial Valley.

You Can Do Equally As Well

These typical stories of success SPELL OPPORTUNITY FOR YOU. Many investors, too, have made enormous profits in Imperial Valley. Land values are rapidly on the increase. Cash rentals range from $20 to $55 per acre. We do not ask you, however, to buy land "on paper." Visit our property and our salesmen will show you the most astounding sights—every-day accomplishments in this Valley of Miracles. Of one party of nine "prospects" who visited our lands recently, eight purchased from 30 to 320 acres. This land, positively the last big tract in Imperial Valley to be subdivided, is GOING FAST. Call, phone, wire or write NOW for literature and complete information.

In preparation for the consumer, and agencies of distribution.

Our transportation has been under continuous discussion for 40 years with ever tightening regulations. I believe the great majority of our people are opposed to nationalization. Nevertheless I doubt whether there is anyone in the United States who is not completely seized with the necessity of rigorous regulation. We are about to return the railways to private ownership under generous terms and, as I have said elsewhere, private ownership is now on its final trial. The proprietors have now to demonstrate their initiative; that they can maintain a right relation to their employes; that they can maintain their administrative efficiency; that they can keep out of national and local politics; that they can conduct these operations in the sense of complete service to the community. If it shall fail in this latter respect our people in reaction will probably be prepared to sacrifice something of its ideals in other directions for the supreme test of efficiency is human service.

I wish to point out one weakness in our present railway situation as bearing upon the farmer. Everyone knows of the annual shortage of cars during the crop-moving season. Few people, however, appreciate that this shortage of cars often amounts to a stricture in the free flow of commodities from the farmer to the consumer. The result is that the farmer in order to sell his produce, often unknown to himself, makes a sacrifice in price, owing to a local glut. The consumer is compelled at the other end to pay an increased price for foodstuffs owing to the shortage in movement. In proof of this, on one occasion a study was made under my administration into the effect of car hortage in the transportation of potatoes, and we could demonstrate by chart and figure that the margin between the farmer and the consumer broadened 100 per cent in periods of car shortage. Nor did the middleman make this whole margin of profit because he was subjected to unusual losses and destruction and took unusual risks in awaiting a market. The same phenomenon can be proved at times of shortage of movement in corn and other commodities.

The usual remedy for this situation is insistence that the railways shall provide ample rolling stock trackage and terminals to take care of the annual peak load. This, however, imposes upon the railways a great investment in equipment for use during a comparatively short period of the year when many commodities synchronize to make the peak movement. It imposes a burden on the entire cost of transportation. This burden of extra equipment will probably always be held to such low dimensions that we will never escape the annual delays in transport and stricture in market. Aside from this question of a peak load we have no doubt fallen behind in the provision of even normal railway equipment during the war.

TRACTOR TESTING

Facts, not promises, will be studied hereafter by the Nebraska farmer who is preparing to buy a tractor, says the Popular Mechanics Magazine. For the state has decreed that all tractor types to be sold within its boundaries must first undergo official tests to determine their actual ratings. Reports of these tests will be at the disposal of the prospective purchaser, who will thus be enabled to make an intelligent choice. Necessary buildings and machinery have now been completed by the state. With the coming of spring, all types and makes of tractors in local use will be rated.

In all, nine tests are given in the course of the searching examination.

PLANT AND FERN COLLECTORS

Have you an intrenching knife of the kind formerly used in the United States army? If so, you have an instrument that will be found useful in the field collection of flowering plants and ferns. Ordinary garden trowels are much too weak for field work, according to Department Circular 76, "Directions for Collecting Flowering Plants and Ferns," which has just been issued for free distribution by the United States department of agriculture.

BRISCOE

"Before you decide Take a Briscoe ride"

Touring Car

Potato Planting

By W. V. Shear, State Department of Agriculture

The recent rain was just what the farmers needed to make the soil moist enough for potato planting. Throughout the early potato districts of the state the work of cutting and planting the tubers has gone forward rapidly. Should a season of wet weather occur at this time there are some important facts to be considered to prevent losses to the potato growers.

We have always advocated treating the seed before cutting and cutting large seed pieces, that is one and one-half to two ounces. The one outstanding fact which has appeared in all potato experiments is that the larger the seed pieces the greater the yield. This is the result when planting conditions are favorable and exceptionally true when unfavorable conditions arise. With an extended season of wet, cool weather, small seed pieces are very likely to decay before planting or to rot in the ground without germinating. A small thin seed piece absorbs the water from the soil and fungous and bacterial diseases develop before the buds or eyes can grow. If the plants do manage to get through the soil they are small and weak and a greatly diminished yield results. The writer has seen great losses occur through the cutting of potatoes into small pieces through unfavorable weather during the planting season.

Treat your seed potatoes by soaking them one and one-half hours before cutitng, in a solution made by dissolving one ounce of corrosive sublimate to every eight gallons of water required. Unless the potatoes are to be planted immediately they should be emptied out and allowed to dry before cutting. This treatment destroys all fungous and bacterial diseases on the surface of the tubers. Nothing pays better than to be liberal with your seed. Insist on having it cut into pieces weighing at least one and one-half ounces — two ounce seed pieces are better. This means ten to 12 sacks of seed to the acre. A little sprinkling of air slaked lime or powdered sulphur over the cut potatoes will cause the wounds to heal over quickly and prevent the entrance of diseases either before or after planting. Seed handled in this way can be kept, if so desired, for a week or two before planting, or if unfavorable weather develops after planting such seed will remain sound in the soil until favorable growing conditions return.

By handling the seed in this way the men can be kept busy during the rainy weather and much time saved as potato cutting is usually the operation which delays planting. If planting is necessarily delayed for considerable time after cutting, the sacks of cut potatoes should not be piled on top of each other and they should be handled over occasionally to prevent heating and consequent decay. They should be kept in a cool, well ventilated place, an open shed being preferable.

CABBAGE WORMS

Every year cabbage worms are more or less prevalent and frequently cause serious damage to cabbage. "These losses may be entirely eliminated," says Professor C. A. Jones of the Colorado agricultural college, "by the use of some arsenical poison such as paris green or arsenate of lead. The poisons may be applied either in dust or spray form. Spraying is probably the most effective and should be prepared at the rate of two pounds of poison to 50 gallons of water to which two to four pounds of laundry soap has been added. The soap acts as a sticker and unless added to the mixture the spray will roll off the wax leaves of the cabbage."

There are several rules that should be followed in spraying for this pest and are as follows:

The spray should be applied when the worms first make their appearance and not after serious damage is done, and should be repeated whenever necessary, as when the various broods appear, which will be about a month apart. The spray should be constantly stirred to keep the poison from settling and applied in a fine mist in order to thoroughly coat the plants with poison.

There is no danger of the consumer being poisoned by eating cabbage poisoned with any arsenical spray if the plants are properly trimmed. Cabbage grows from the inside and any poison that might adhere to the outside layer of leaves is removed.

RICE STANDARDS

Commenting on the standards recently established by the bureau of markets, the Rice Journal says editorially:

"The establishment of official government standards for milled rice is a very radical step in rice marketing, but one which will mark the longest stride made in many years in the industry. Like most radical steps the change must properly be brought about gradually. Rice grades have been discussed for a considerable length of time, and they were applied in a practical way on the government purchases of rice during the season of 1918-19. It is necessary that the millers and the buyers of rice become gradually accustomed to this new method of marketing, so that they will not be materially damaged by misunderstanding the grades or the methods used in their enforcement.

"Appreciation of the importance of the change has been shown by the bureau of marketing of the department of agriculture, and they have not forced a hurried change in the system which has always been in use in the rice trade, i. e., selling by sample.

"Hearings are now to be held in different milling and trade centers, after which the official standards will be adopted and enforced by the government the same as they are now used in marketing other grain. Some changes have already been made from the first tentative standards and the hearings will no doubt bring out the necessity of still others.

"This step means that rice will in the future be sold on the same economical basis as other grains. There will be no necessity for sending type samples and this will eliminate a considerable expense of marketing and at the same time facilitate the operations so that a carload of No. 1 rice may be sold by wire with the buyer knowing just what he is going to get. If he doesn't get No. 1 rice he will have recourse to authorities who will pass on it and determine its grade. The whole thing will be much simpler than the present method, once the buyers and millers become familiar with the grades, though they must not expect to do this without some trouble. No such a revolution in marketing methods can be accomplished over night or without inconvenience and perhaps some loss due to misunderstanding of grades. But the benefits of the new methods will be so great that temporary inconveniences will soon be forgotten and rice will for the first time go on the market the same as other grains, putting the industry and trade on a much more stable and profitable basis."

SHE KNEW

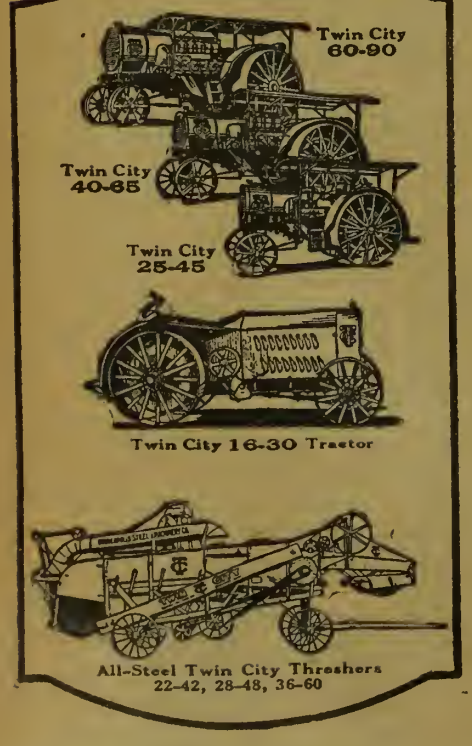
Five year old Freddy was using his fists on three year old Helen. "Freddy, stop!" commanded his mother. "Don't you know that a gentleman never strikes a lady?"

Instantly Helen stopped crying. "They do too," she contradicted.

"Why, Helen," said the mother, "when did you ever see a gentleman strike a lady?"

With an air of convincing proof the little maid quickly replied: "Daddy spanks me."

"We Can Break That Old Alfalfa Field With Our Twin City"



THE toughest going in the old alfalfa field won't halt the Twin City 12-20, for it has built into it the surplus power to take the plows straight through and the surplus strength to stand up under continuous load.

Farmers everywhere know the performance of the Twin City 12-20 Tractor. Many of them know the engineering science—in design and construction—that makes this performance possible.

Sixteen (Valve-in-Head) Engine for perfect kerosene burning; removable cylinder head and cylinder walls, for easy access and quick adjustments; counterbalanced crankshaft for reduced vibration; transmission, direct on both forward speeds, mounted on Hyatt roller bearings; gears drop forged, steel cut and case hardened, running in a dust-proof oil bath.

The result is a surplus-powered tractor of great strength, light weight, low operating cost and thorough dependability—*built to do the work, not to meet a price.*

Write us today for full particulars of this Twin City 12-20. Also ask about the all-steel Twin City Threshers.

THE FARM BUILDINGS

In the building of manufacturing plants one of the first considerations is the position, arrangement and relation of the several or many buildings. The arrangement of them is not left to the architect but some practical authority dictates their proper relation from an economic point of view. There is no haphazard setting of buildings for mere sake of appearances, though the latter is a factor in the determination.

The farm is a manufacturing plant and the buildings are the mediums through which the products find their way to the market; they are the executive center. Storage of crops has a definite relation to the feeding and housing of livestock, for example, and buildings must be so placed that the most economic use may be made of them. In general, climate is one of the most important factors. But in California many have become careless in arrangement because protection of men and livestock against cold is not of such vital importance as in other states. To this may be ascribed much of the indifferent placing of buildings, which leads to waste of both time and material. And climatic considerations should still dictate. We need protection against the cold winds of winter, yet an encouragement to free passage of cooling breezes in summer. The direction of prevailing winds must not be ignored. To the thoughtful the proper arrangement of farm buildings in California is as much of a problem and as necessary of solution as it is in less favored climes.—E. B.

PAINT ON THE FARM

Fresh paint on buildings gives an air of prosperity to the farm that nothing else can supply, and the value of the property is thereby greatly enhanced. This matter of appearance is a vital one in every walk of life.

A great and successful manufacturer was asked to deliver an address before a graduation class in the local university. To the boys he said: "If on leaving school I had but $20 I would buy a suit of clothes, get a hair cut, shave, and my shoes blackened; even if I had to walk to find a job." Early the next Monday morning a young man presented himself, all spick and span, and said: "Mr. Blank, I followed the advice you gave us last Friday; I had but $22 left, and I want a job." In telling of the incident afterward, the manufacturer said the young man was one of the ablest and neatest employes he had at present. There is a premium on good appearances.

A coat of paint sometimes works a wonderful transformation. Increased beauty is of itself a sufficient reason for the free use of paint, yet it is not the main reason or purpose for applying it. Protection and preservation are the chief reasons for its use. Nothing so arrests decay in wood or so protects against checking, cracking and splitting as a liberal coat of good quality paint. After such wood deterioration has taken place it is in vain that we paint and repaint in the hope that it will replace the ravages wrought by time and weather. It has also been clearly proven that paint is a protection against fire, so much so that all insurance companies note the surface condition of buildings for which insurance is sought. In spite of all the good reasons for painting the writer firmly believes that improved appearances—added beauty—that atmosphere of prosperity which it carries, is sufficient reason for the free use of paint on the farm.—E. B.

WHAT PRUNING DOES

Pruning facilitates orchard operations by removing limbs that will hinder cultivation, spraying and picking.

It gives mechanical strength to the plant by preventing the formation of weak crotches or a willowy growth.

It corrects poor habits of growth.

It produces new wood, which will be proportional in amount to the severity of the pruning done at this season.

It induces fruitfulness.

It opens up the tree to sunlight and air which are all important factors in the coloring of fruit.

It facilitates the combating of plant diseases and insect pests. It is often necessary to prune affected trees to an open top in order that diseased portions may be readily removed.

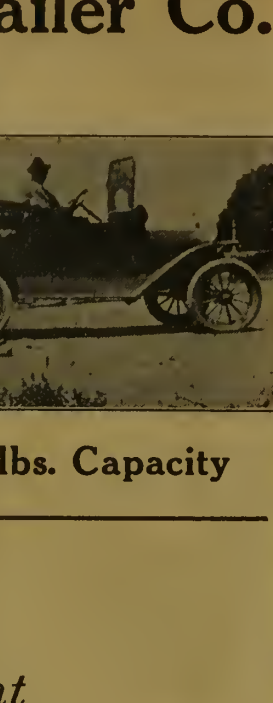
Wonderful New Hay Crop
SUDAN GRASS

First introduced into the U. S. in 1909 from the Sudan in Africa. Tests by the department of agriculture have proved it to be of the greatest value in the Southern and Western states, where rainfall is deficient.

Culture—Sudan Grass is strictly an annual. It may be drilled or broadcasted. If drilled 8 to 12 lbs. per acre is ample; for broadcasting 15 to 25 lbs. should be used. It grows 8 to 10 feet high and yields from 3 to 8 tons per acre. You are sure of two cuttings, and if irrigated three or four cuttings.

Sudan Grass for Pasture—During the months of August, September and October all other grasses are dry, then is the time Sudan is most valuable for fall pasture, and by having it fenced in small fields it will yield food for six times as much stock as any other forage will without irrigation. For milk cows and hogs, there is no better and more abundant pasture than Sudan Grass. It will solve the hay proposition as nothing else can or will do in this climate. A good silage and balanced ration. This seed was grown on our own farm, and is free from Johnson Grass.



Price Per Pound:

10 lb. lots, 25c 100 lb. lots, 20c
250 lb. lots, 19c 500 lb. lots, 18c
1000 lb. lots, 17c

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Security for Larm Loan

My wife and I each hold title to separate pieces of property upon which we expect to apply for federal farm loan. Under the farm loan plan would separate mortgages from each of us be necessary as security on which to issue a loan to one or to both jointly? One of the parcels is the separate property of my wife, the other is homestead property for which I received United States patent after residing thereon with my family for the required time.—Subscriber. Valley Center.

There is no particular rule of law in respect to answer of such a question. It is merely a question of management on the part of the farm loan bureau. As to the separate property of the wife, it will be legally possible for her to give the mortgage without the husband joining. Upon the homestead, it will be necessary for both to join. A single mortgage could be given upon both properties, both husband and wife joining in it without the necessity of any conveyance of title to the respective properties.

Joint Tenancy

In California, can a husband and wife be joint and several owners of real estate so that in case of the death of either party the property would belong to the survivor without legal process after said decease?—Subscriber, Valley Center.

The term joint and several is exactly contradictory. The property may be deeded to two parties to hold as joint tenants with right of survivorship. In the case of the death of either of the parties, the survivor succeeds to the whole interest in the property. In such case, in order to perfect the chain of title, a proceeding of the probate court is necessary so that the fact of the death of one of the tenants may be established of record. Such proceeding is however very inexpensive. The term several ownership of land simply means, as far as it means anything, that the person holds the whole title to the land without further interest.

Assessment on Water Stock

I bought a piece of unimproved land with 15 shares of water stock. The land is not as yet connected for the use of water but the company some time since voted to make assessments for the purpose of developing more water, which development is to be done on my land and of which I was not notified. Can I be held for this assessment?—Subscriber, Long Beach.

If the stock was issued to you at the time of the levy of the assessment unquestionably you would be subject to the process of law for the collection of the assessment. Such assessment is levied by the board of directors under the provisions of the by-laws You should, however, have been given notice of such action, but a complete answer could not be given on this question without a particular examination of the by-laws and organization of the company in question, as different concerns have different means of notifying stockholders and there are different by-laws in respect to matter of assessments on water stock.

Developing Water

Land which I purchased from a water company has located upon it a portion of the water supply of the company. Can I develop water for my own use upon this land?—Subscriber, Long Beach.

Whether or not you could develop water upon the land would be entirely determined on the question whether or not there were any restrictions or reservations contained in the deed or contract which was issued to you by the water company upon the sale of the land. If such deed or contract contained no such reservation and was a straight deed, then it would seem that there could be no objections to your developing the water.

Bar Examinations

Where would I obtain information as to the entrance examination for the bar of the state of California?—Subscriber, Escondido.

Under the last legislature a board of examiners was appointed to conduct examinations for aspiring lawyers. They from time to time issue the requirements as to reading and time of taking examinations at Los Angeles, San Francisco, and Sacramento. In order to obtain detailed information you should write to Clerk of the District Court of Appeals, Los Angeles, California, and you will undoubtedly be furnished with the complete information which you request.

Age of Majority

Under the law of Kansas a girl reaches majority at the age of 21. In California she attains her majority at 18. Can a girl 18 years of age residing in California give a binding deed to real estate located in Kansas?—Subscriber.

This question is one wherein the authorities are more or less conflicting. In the early stage of the law it was held that the law of the domicile of the infant at birth governs the state and condition of the person as to minority or majority into whatever state or county he may remove. But the better rule and that supported by the great weight of authority is that the law of the place where the contract is made or the act done governs in determining whether a party is or is not an infant. Under such latter rule, if the deed is fully executed and delivered in the state of California by a girl past 18 and not yet 21 who resides in the state of California, it would be a legal and binding contract and not subject to disaffirmance.

Queries

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Trapping Mole

What is the best way to get rid of moles? Have tried to trap but it is not a success. What do they eat mostly, and would there be a chance to poison them? — Subscriber, Anaheim.

It is a most impossible to poison moles. They live on insects or worms infesting the ground and to that extent are beneficial. On the other hand their injury in lifting young plants and disturbing the ground compells us to eradicate them. The trap is usually very successful. The kind we have used we do not know the name of but it is the ordinary mole trap with a pair of jaws on either side of the trap or trigger. With the foot one presses down the soil which has been raised by the mole and the trap is set so that the trigger comes directly above this pressed down soil. No matter which way the mole comes if the trigger is sprung the jaws are released on either side. The kind of trap with sharp

blades or prongs driving straight down from above has not been as satisfactory.

Trees on Line

How close to the property line is it lawful to set trees for a windbreak?—Subscriber, Owensmouth.

There is no law directly touching upon this subject. One may set the trees as close as he pleases to the line but of course if it damages adjoining property the amount of the damage may be collected. If the trees are set close enough so that they ultimately cross over the line then they become the property of both real estate owners and we believe may not be cut without the consent of both parties.

Nematodes on Citrus

Is it safe to plant citrus nursery or orchard trees on land so infested with nematodes that it is impossible to grow tomatoes or most vegetables?—Subscriber, Glendora.

Nematodes infest citrus trees. But whether they are the same pests which infest vegetables we could not answer, so referred this question to D. C. Milbrath, of crop disease investigations, U. S. D. A., located at Alhambra, and Mr. Milbrath answers:

"The nematode causing destruction in vegetables and some fruits is Heterodera radicicola. The nematode which has been associated with root infestation of citrus trees is Tylenchulus semipenetrans, an organism differing morphologically from Heterodera, the root knot nematode. In 1889 Dr. J. C. Neal reported Heterodera as occurring on lemon, orange and bitter-sweet orange, while a similar report is made by Tavergne from Chile in 1901. Dr. E. A. Bessey spent three years investigating nematodes in Florida and failed to find Heterodera on citrus species in sections where that organism attacked severely other plants. My own experience in Florida confirms Bessey's. In all recent researches, citrus species have been considered not susceptible to the attacks of Heterodera radicicola. There is a possibility of error in Neal's and Lavergne's diagnosis. It is highly probable that Tylenchulus semipenetrans is not in the soil which you have in mind to plant to citrus stock."

Weeping Mulberry

Please tell me if a weeping mulberry tree should be cut back to two buds of last year's growth or allowed to remain as it is.—W. P. S.

You may prune the tree to suit yourself; you cannot injure it. But if pruned at all it should be with purpose. What you wish to do with it ultimately is the question. If you simply wish a weeping shrub, leave it alone; do not prune at all. I once set an inch pipe in the soil next the trunk of one, had a giant wheel built on top and tied the many branches, equally distributed, around the edge of this wheel. In summer it made a fine small arbor to sit under and each year grew more beautiful.—E. B.

TRUCK SHOW

Beginning Saturday this week and continuing until April 3, there will be staged in Los Angeles at Praeger Park the first exclusive truck and trailer show in the Southwest. A large tent has been erected and an extensive exhibit of nearly every type of motor truck has been installed. President Power of the association states that interest of San Francisco dealers is shown by a very liberal exhibit which has been sent down from that city. There will be several models not heretofore shown in the Southwest.

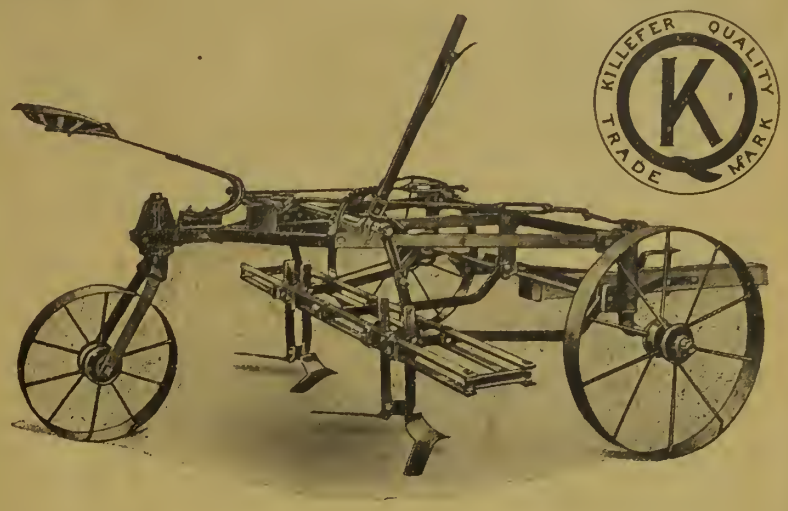
The most complete accessory exhibit yet made is arranged, and power is supplied for keeping many of the exhibits in operation. All space was engaged nearly two weeks ago. Parking space for visiting autos has been arranged.

Two Row Bean Cultivator

Catalog No. 262

KILLEFER QUALITY

KILLEFER EFFICIENCY



This Cultivator has been developed like most of our implements, at the suggestion of ranchers, for a strong, simply controlled cultivator, capable of doing their work better than with a lighter made tool.

The frame is made from one piece high carbon steel without joints to work loose or sag and holds the wheels always true and in line with the rest of the machine.

The double frame bar gives ample clearance between the standards and eliminates the tendency to clog in trashy ground. This frame bar has a double lifting device which holds it rigidly on both sides. A man's weight on extreme end of frame bar will not spring it out of line.

The seat is set far enough back to give an unobstructed view of the rows and the foot control is very easy to operate.

An important item for the ranchers' consideration, is that all parts and repairs are quickly obtained as we carry a supply on hand.

Owing to the shortage of steel products you should place your order as soon as possible. Write for catalog and price list.

The Killefer Manufacturing Co.

2209-21 Santa Fe Ave. **Los Angeles, Cal.**

Perforated Tree Protector

that will keep Squirrels, Rabbits and Gophers from barking your trees and give perfect protection from hot sun, sandstorms, barking in cultivation, etc. Tell us your pest and we will tell you what kind of a wrap to use. We make a number of kinds and can save every tree for you from pests.

Collapsible Planting Pots

These pots are bottomless. This allows you to plant pot and plant, never disturbing your plant nor stopping its growth in transplanting a single hour.

For starting early vegetables, such as Tomatoes, Cabbage, Eggplant, Cauliflower, Cucumbers, Cantaloupes and Squash; also for propagating Rose Cuttings, Geraniums, Eucalyptus, Olive Cuttings. It's the only practical pot on the market today for propagating work. Write us for samples of either Pots or Protectors. Tell us which you are interested in.

What's A About DE

"Somebody" said four years—when Delco-L find of the age. "Somebody" was the first farme home and outbuilings and furnish power for labor de accomplished in his own household. Soon, a thous They joined in the talk and started this story that and to-day there are more than 100,000 satisfied us advocates of this time-tested light and power plant

Delco-Light Distributors have strived faithfully to analy Delco-talk—to find what features of this light and power unit for country homes, pleased owners most. Frankly, the task has prov ficult—except that talks of "savings and new profits" is always Here are some of the samples:

James J. Brennan, Loomis Place, Calif., says that "next to Liberty Bonds, Delc is the best investment a farmer can make. It saves me forty hours a week."

Joseph Black, Oroville, Calif., writes: "I would as soon give up my water suppl be without my Delco-Light."

Leland F. Forbes, Loomis, Calif., says: "By installing the Delco-system, we are about 700 more eggs daily."

From Fred G. Anderson: "My Delco plant has been in use for about 18 months, date not even an adjustment has had to be made."

Mrs. W. J. Hawkins, Vacaville, Calif., says: "To say that I am pleased with our Light is just putting it mildly. I would not be without if for double its cost."

And that's the way it goes—the many trends of Delco-talk.

The ease with which DELCO-LIGHT is installed in any home—its l life—its use of kerosene for fuel at a cost of a few cents a day—its simpli of operation (any member of the family can run the plant)—are among features that furnish talking points for satisfied users.

It's a fact that housewives contribute as much to Delco-talk as their h bands—or more. They delight in the Delco-way of washing, ironing, vacu sweeping, churning, separating, milking, etc., with power furnished by t Delco plant. They take a new pride in the home FILLED WITH BRIGH NESS; the home INSURED AGAINST FIRE hazards that were pres with open flame lights; the home FREED FROM DRUDGERY form imposed by so much hand-labor.

Farm bred men who designed Delco-Light began with the det ation to hitch up electricity in a simple, practical harness. They convinced it could be made to lighten and brighten labor on far moved from power-supply sources. Electricity had proved invalu city homes for years. How could it be installed on any farm? spent five years on the problem.

Then they introduced the Delco-Light plant.

They backed it with a guarantee of efficiency. That guaran emphasized today. That guarantee is as follows:

You can have a Delco-Light plant installed in your home at put it to a 30-day test and if it isn't ALL-satisfying, it will be tak without expense to yourself and your money will be refunded chec

$332.40 Per Year

The Actual Saving on the Average Farm in Time and Money

Above is illustrated the actual saving on the average farm in time and money made by employing Delco-Light and power for six jobs—only six, mind you, of the 50-odd devices for which Delco plants are adapted. Satisfied users furnished these records—made by themselves on their little or large farms equipped with Delco-Light.

Figure out for yourself the savings you can make by putting a Delco-Light plant to work on your farm—and consider the joy it will bring by flooding your farm with brightness; filling it with power. Figure your operating costs on a cent-a-day basis.

Delco-Light is so simple that anyone can operate it. Starts itself on the turning of a switch—stops automatically when batteries are full. Gas engine and dynamo for generating the current are combined in one compact unit.

Delco-Light has been developed by the same engineering and manufacturing ability that has made Delco cranking, lighting and ignition for automobiles the standard of the world. Within its four years of tested merit, Delco-Light has become the world's standard for farm use.

Ormondale Ranch Gets Imported Bull

California Shorthorn Interests have been greatly strengthened through the purchase by Ormondale Ranch, Redwood City, of the imported bull, Boquhan Guinea Stamp. This bull, a roan two year old, was secured from the select importation recently made by William Hartnett and is counted one of the best in that notable collection.

The blood lines back of Boquhan Guinea Stamp leave little to be desired and his individuality is indicated by the fact that he was second in class at the Highland Show to the Prince of Wales' entry that was first at the Royal Show at Cardiff. He was third in class at the Perth Show and the statement has been made that many good judges thought him the best stock bull at Perth.

The Ormondale herd is generally conceded to be among the better herds of this state and has been responsible for many high class Shorthorns, the most notable of which is Little Sweetheart owned by T. S. Glide, Davis, and grand champion at the 1919 International. California breeders will await with interest an opportunity to see Boquhan Guinea Stamp.

The price paid for the new Ormondale herd bull is said to have been $12,000.

J. M. MacDonough is the owner and James McDonnell manager of the Ormondale herd.

Boquhan Guinea Stamp

Recently added to the Ormondale Herd. Boquhan Guinea Stamp was shown successfully at a number of the leading British shows and is regarded as one of the good bulls imported in recent years.

Livestock Auctioneers---Hammond, Bradley and Johnson

Our big 2 days sale at the Fuller Bros.' Ranch (cattle, mules and implements), Imperial Valley, March 5-6, was the biggest and most successful sale of its kind ever pulled off on the Pacific Coast.

At the R. L. Vorhles sale of 82 dairy cows at Artesia, March 17, we broke the Pacific Coast record on prices for grade cows—$530 being the top price for the day. Write or wire for dates, terms, etc.

CALIFORNIA CATTLEMEN'S ASSOCIATION NOTES

Fred H. Bixby, president of the California Cattlemen's Association, has issued the following statement to define the association's attitude toward cattle loan companies:

"While I am president of the California Cattlemen's Association, the association will never ally itself in any way with any one cattle loan company. We want as many cattle loan companies and as many banks loaning money to catflemen as we can possibly get; competition means a reasonable rate of interest for stock raisers. The California Cattlemen's Association is keeping its ship in the middle of the stream as far as cattle loan companies are concerned."

* * *

The California Cattlemen's Association wired to Attorney General Palmer offering him the association's cooperation in the save on meat campaign which the attorney general has launched all over the United States and which is to have a week in each state. In California this starts March 29.

The association has suggested to the attorney general that he change the slogan of this campaign to eat meat intelligently, as it is feared the present slogan may be misinterpreted to mean curtailment of meat consumed.

The attorney general's idea was to popularize the cheaper cuts of beef, and as this fits in with the interest of all those concerned in beef production and marketing it is expected to lead to a joint campaign by cattlemen, packers, wholesalers and retailers of meat. This will take the form of recipe contests for housewives, moving picture demonstrations, carcass cutting exhibits in the large cities and the service of dishes made from the cheaper cuts in restaurants and hotels throughout the state.

* * *

Successful meetings of cattlemen have been held within the last few weeks at Mariposa, Oakhurst, Hat Creek, Merced, Nevada City and Santa Ynez. Everywhere the cattlemen are showing enthusiasm for the work of the association, and the association membership is increasing at a satisfactory rate.

UNIVERSITY SECURES CATTLE RANGE

The college of agriculture of the University of California has just taken over on a long lease 2,000 acres of winter range in El Dorado County, together with 1,800 acres of summer range. The range will be utilized in conducting extensive beef cattle experiments. Breeding, feeding and management problems will be given attention. Supplementing the range operations the college is arranging to construct at the university farm, Davis, one of the most modern cattle feeding plants in the country. To date little or no work has been undertaken to investigate beef cattle problems in this state, but the time has come when this important branch of the livestock business must be accorded the same effort that has been given other branches of livestock production.

Several hundred head of cows are now on the range and the institution has recently purchased a number of high class bulls to be used in the grading up process.

JAMES' TASK

"Now, I want all the children to look at James' hands and observe how clean they are, and see if you cannot all come to school with cleaner hands. James, perhaps, will tell us how he keeps them so nice."

"Yes'm, ma makes me wash the breakfast dishes every morning."—Life.

The Whole Story

of silos is contained in a single sentence taken from Circular 138, Agricultural Experiment Station, University of California:—

"Silos with thin, flimsy walls, or built of plain staves admit considerable air to the siloed mass, and although cheap in first cost are the most expensive silos, owing to the excessive fermentative losses that occur therein."

The staves of the "Simplex" Silo are cut from Clear Oregon Pine (Douglas Fir) in one piece lengths the entire height of the silo, with heavy tongues and deep grooves, eliminating end joints and leakage of air—giving smoothness to the inner surface.

Steel hoops and the patented Interlocking Anchorage System bind the staves and base together so rigidly that nothing short of a cyclone can wrench them apart.

The Crisell Tangent Top automatically keeps the "Simplex" in a true circle no matter how often it may be necessary to tighten or loosen the hoops.

These are features designed to comply with scientific requirements. They make the "Simplex" Silo scientifically correct; they insure the greatest economy. Are not these two facts alone worth your consideration?

Built of Clear Oregon Pine
"Scientifically Correct"

Let George Do It

is a poor principle to follow if you want a job done right.

It is just as necessary to fill your own silo as it is to do your own plowing, planting and spraying.

Because of its sturdy construction, low up-keep, and mechanical perfection of its working parts, the Papec Ensilage Cutter is the right cutter to do the job right.

Before buying an ensilage cutter compare the Papec with any other cutter made, part for part, feature for feature. It is because the Papec has proved its capabilities by actual performance that we invite this comparison.

BETTER silage--at lower cost! That's what you get with the Ross Ensilage Cutter. *Clean-cut silage*--from the first hour's operation right straight through the heaviest silo-filling job, and year after year of the same high-class low-cost service.

Better Silage--at lower cost. Do you want to know why? Walk into the store of the dealer who sells

Ross Ensilage Cutters

and ask him to show you the special *Ross Ball-Bearing End Thrust* and *Extra Knife Adjustment* which forces the knives right up against the shear bar *and holds them there*--absolutely preventing shredded silage or "chewed" silage--and keeping the rich juices in the corn, where they belong--*by cutting every piece slick and clean.*

Rockwood Fibre Pulley

Note that Ross Flywheel Cutters are equipped with genuine Rockwood Drive Pulleys. These pulleys *grip* the belt perfectly and *absolutely prevent slippage.* No wasted power and no jerking--no matter how heavy the load.

Low Speed — Light Draft

The staunch, sturdy Ross is built for hard work and lots of it. Requires minimum power--and hums right through the toughest job at a steady, low speed. *No straining or racking.*

Six-Fan Blower--Wish Bone Steel Mounting. Babbited, Self-Conforming Bearings on Main Shaft. Angle Steel Frame

Study the Ross carefully. Compare it--part by part--with any other cutter on the market, selling at any price. Ask about the Ross Warranty which *guarantees absolutely satisfactory service.*

We Match Your Power

Ross Ensilage Cutters are especially designed for use with gasoline and kerosene engines. You don't need a special engine. *There is a Ross to match your present power*--from four horse-power up.

"FEEDFINE" FEEDS

	are scientifically compounded in proper proportions for dairy and all livestock feeding, of the following ingredients with the most economical results always in view.
YEAST	A concentrate high in PROTEIN and FAT content, sterilized and predigested.
CANE MOLASSES	The richest of feeds in carbohydrates—produces increased appetite on account of its palatableness. Its consumption results in increased energy and it is the best tonic known for animals.
ALFALFA MEAL	Gives body to the ration and supplies the mineral matter which is absolutely essential to all animals.
	The greatest known combination for health, strength and productiveness.

Rice Bran for Stock Feed

W. B. WISE, secretary of the Rice Millers Association, speaks a few good words for rice bran in the Rice Journal of Texas. He says:

"Before going into a discussion of the merits of rice bran as a stock feed it is important to know just what it is and how it is secured. Rice bran has been properly defined by the Association of Feed Control Officials of the United States as 'The cuticle of the rice grain with only such quantity of hull fragments as is unavoidable in the regular milling of rice.'

"The rice grain is covered with seven rather distinct layers of bran cells, with the oily germ near one end. Commercial rice bran is a by-product of rice milling which is composed primarily of the outer three of these bran layers and the germ, which constitutes the richest part of the kernel. When rice is milled harshly the bran may also include the fourth and even a part of the fifth bran layer. This by-product is secured by a process exactly the opposite of that by which wheat bran is made in the manufacture of flour. Instead of crushing the entire kernel and separating the bran by sieving or bolting, as in wheat milling, the rice grain is exposed to a more or less severe scouring. In practically all of the rice mills this scouring off of the bran is done in two and sometimes in three steps, so as to lessen the breakage of the grain. The cleaned threshed rice is hulled between heavy stones, the hulls removed by fans and the hulled grain is conducted into the series of scouring machines for the removal of the bran. Rice kernels are never uniform in size and in commercial practice the stones are adjusted to hull the average sized kernels, so some of the largest and plumpest are broken and degerminated and many of them also lose a part of the bran in the hulling operation. Such bran and germs are separated from the partially milled rice by means of a fine meshed bran reel. This material is known in the mills as 'stone reel' bran, and constitutes the first part (about 26 per cent) of mill run bran. Rice bran found on the market is composed of 26 per cent stone reel bran, 35 per cent from the first scouring machine and 39 per cent from the second scouring machine. These three parts are blended as they are produced, and the final product is brown in color, mealy in texture, full of invigorating vitamines, and with a fresh sweet odor of bran bread.

Composition

"Considered chemically the stone reel bran shows a relatively high percentage of total ash and ash insoluble in hydrochloric acid, and also contains a relatively high percentage of crude fiber. There are present correspondingly low percentages of protein, fat and nitrogen free extract. This composition is caused by the presence of a trace of finely divided hulls which can not be separated in commercial milling. The writer wishes to emphasize the fact that, contrary to some expressed opinions, the stone reel bran if fed alone is a perfectly safe stock feed, and when mixed in the proportion of one to three with the rich scouring machine products the infinitesimally small percentage of hulls present is of no importance. The rice bran from the first and second scouring machines contains a relatively low ash and crude fiber content, and a high percentage of protein, fat and nitrogen free extract. Since these three parts of commercial bran are not marketed separately, we are interested primarily in the composition of their mitxure as it comes from the mill. This is found to vary considerably, because rice milled under different conditions of moisture, in different mills, and even in the same mill, but with different adjustments of the machinery, will yield bran of varying compositions, and the same is true to a greater extent when different varieties of rice are milled. The United States department of agriculture Bulletin No. 570 is authority for the following average composition of commercial rice bran, in which the figures for only the important feeding factors are quoted here: 'Protein, 13.70 per cent, fat 14.75 per cent, crude fiber 11.28 per cent. The Louisiana state experiment station Bulletin No. 191 gives the composition of rice bran as: 'Protein 13 per cent, fat 13.1 per cent, crude fiber 12 per cent,' and the Texas agricultural experiment station Bulletin No. 191 gives on this subject the following figures: 'Protein 13.63 per cent, fat 14.78 per cent, crude fiber 11.69 per cent.' A majority of the states in which this feedstuff is used extensively require for registration minimums of not less than 12 per cent for protein and for fat, and a maximum of not more than 12 per cent for crude fiber. Pure commercial rice bran will in practically all cases come within these requirements, and in most cases will show on analysis a composition considerably above these limits in food value.

Digestibility

"In considering a stock feed, the average chemical composition is of importance only as indicating, but not as proving, the real value of the feed considered. Its food value and fattening qualities depend upon its palatability and digestibility. Rice bran is eaten greedily by livestock when fed alone or in any combination. It contains approximately eight per cent digestible protein and 65.8 per cent total digestible nutrient, as compared with 12.5 per cent digestible protein and 60.9 per cent total digestible nutrient in wheat bran. The most modern method of judging a feed is to consider it on the basis of its productive value. The productive values of various stock feeds have been worked out by the Texas agricultural experiment station, and the figures given not only indicate the quantity of fat which a feed will produce upon a fattening animal, but also indicate the relative value of a feed for work, milk production, energy, etc. Rice bran with a digestible protein content, according to the above authority, of 7.88 per cent, has a productive value of 17.2 per cent, while wheat bran, containing an average of 12.5 per cent digestible protein, has a productive value of only 12. Wheat gray shorts, which is a very expensive and concentrated feedstuff, has a productive value of 18.9, or only 1.7 greater than rice bran.

Feeding Experiments

Many experiments have been conducted with both cattle and swine in which rice bran was used alone and in combination with other feeds. It was found to be not only very palatable when fed alone, but its mealy texture and palatability caused it to be well adapted for mixing with corn chops or with coarser feedstuffs for cattle, or with raw or cooked mash for swine. The Texas agricultural experiment station Bulletin No. 151 gives the result of a 91 day test in which three pens of six hogs each were fed respectively 1,535 pounds of rice bran, 1,082 pounds of peanuts and 111 pounds of corn chops. According to the gains made in this experiment by the animals fed on rice bran, hogs may be fattened on it at the present price at a cost of 6.2 cents per pound gained, which is considerably less than the cost if either of the other two feeds were used. As a feed it is considered a concentrate, and in the production of fat, milk or energy yields the best returns when fed in combination with such feed as corn chops, in which the ash and fat content is too low for a maximum profit. Because of its palatability it is often used with less palatable feeds to insure the consumption of the mixture by the animal.

ANNUAL HEREFORD ROUND-UP SALE

The third annual Hereford Round-up Sale held at the Kansas City Stock Yards, Kansas City, Missouri, March 1, 2 and 3, was one of the largest and most important events in Hereford af fairs. More animals were sold than were ever before offered in one sale. The 600 cattle were consigned by 115 breeders from 11 different states. They were bought by 127 buyers from all parts of this country and from South America. South American buyers bought 18 bulls and four females, 22 in all.

The sale was conducted under the auspices of the American Hereford Cattle Breeders Association and was especially designed to furnish a me-

dium in which the smaller breeders could place their sale cattle before a large group of buyers. That the sale supplied this want is evidenced by the fact that more than 1,000 breeders attended the sale and many buyers who were in the market for bulls in carlot quantities were able to fill their orders.

The sale served as an educational factor in that it demonstrated the advantage of having cattle well grown and in fair sale condition. Animals consigned to this sale that were undersized and in thin condition sold at prices less than they would bave commanded had they been sold for beef on tbe open market, while cattle that were well grown and were presented in good condition sold for long prices that paid a good premium for the work and expense involved in the preparation of those cattle for the sale. The following summary clearly illustrates the point in question:

370 bulls, $111,740; average, $302. 230 females, $84.525; average, $367. 600 head, $196.265; average, $327. 50 top head, $65.625; average, $1312.50. 100 top head, $89,190; average $892.

FATTENING ON SILAGE

I know a feeder near Tucson wbo recently marketed 21 head of steers that had been fattened on a ration consisting chiefly of silage. These 21 head weighed 13,400 pounds, or an average of 638 pounds per head, when they came off the range. They were started off on the following ration: 15 pounds silage, one pound cottonseed meal per head per day with all the alfalfa hay they could eat. The silage ration was gradually increased to 30 pounds per head per day and during the last two weeks two pounds of cottonseed meal per head was fed daily.

The alfalfa hay had been damaged by rain and was not first class; the steers consumed probably eight to ten pounds of hay per head daily.

At the end of 60 days of feeding the entire lot of 21 head were marketed and weighed 15,890 pounds, or an average of 756 pounds per head, after a four per cent shrinkage had been deducted. The average daily gain per head was slightly under two pounds at an average cost per head per day of 25 cents. The steers cost $48 per head which was a good price according to tbe market at that time. With the steers selling for 11 cents per pound, cbarging the cottonseed meal to them at $70 per ton and the alfalfa hay at $20 per ton, it is not hard to see that silage is a valuable feed as a base for fattening cattle, to say nothing of its value as a maintenance ration for range cattle during a dry season.

If the steers had been from good stock a higher return on tbe feed would bave been made.—C. U. Pickerell, University of Arizona.

GARLIC FLAVOR IN MILK—HOW TO PREVENT IT

Dairymen and creamerymen in many states are troubled every spring by garlic or onion flavor in tbe milk. Tbis is due to the cows feeding on garlic or wild onion, one of the first plants to start in the pasture in the spring. The trouble from garlic is not likely to last very long, as this weed is soon cropped off and the grass becomes plentiful enough for the cattle to feed on it in preference to the onion.

Garlic flavor in milk can be removed by heating the milk to 145 degrees Fahrenheit and forcing air through it at this temperature for 30 to 60 minutes, according to Farmers' Bulletin 608 of the United States department of agriculture. As this metbod requires a certain amount of equipment it is much more satisfactory for the average dairyman to keep the odor out of milk by a few simple precautions in herd management.

Tbere are two ways of protecting the milk from garlic flavor. First, prevent the cows from obtaining garlic, and second, manage the herd on garlic pasture so that there will be the least possible chance of getting the flavor in the milk. Often the garlic is found only in one patch in the pasture, and this can be temporarily fenced off and pastured with other animals not producing milk. Where garlic is scattered all over the field it will be impossible to keep the cows away from it, but by removing them to some other field three or four hours before each milking the flavor will be reduced to a minimum. The odor in milk is strongest from cows whicb have just eaten garlic, and the odor is reduced as the time between the eating of garlic and milking is increased.

In case no garlic free pasture is available it would be advisable to drive the cattle to the barnyard tbree or four bours before milking and feed them on hay and silage. As the season for garlic trouble is short, tbis should not cause much inconvenience. The best plan for avoiding trouble from this weed on the dairy farm is to kill it out completely.

THE FARMER'S PART IN THE TUBERCULOSIS ERADICATION CAMPAIGN

It is a well known fact that the large meat packing concerns make a practice of paying prices lower than tbe prevailing market quotations to owners of hogs in certain districts. The packers have found that from these districts they get a higher percentage of tubercular swine witb greater loss by condemnation. In some of these cases tubercular swine have been raised on tbe same ranch with cattle that are known to be tubercular.

The use of unpasteurized skim milk probably may be largely accountable for this condition, but more so is tbe fact that frequently pigs are allowed to run in the same corrals with cattle. The droppings from tubercular cattle are generally very infective.

Where pasteurization of milk is required by law or the cows tuberculin tested the disease sbould be rare in hogs. This, however, is not true, due to the fact that many large hog raisers ship only the cream, tbe skim milk being kept on tbe ranch and fed raw. This milk should be pasteurized on the farm before use. To the average man this sounds like a formidable performance, but in reality it can be done quite easily, especially since most large dairies now have a steam boiler in operation for general sterilization purposes. A can of milk may be brought to 160 degrees Fahrenheit in a very few minutes by inserting a hose from the boiler. By then cutting down the steam to but a few bubbles a minute, the temperature can be held nicely for the proper length of time, 20 to 30 minutes.

It should also be remembered that many breeding boars and sows are tubercular and that such animals can undoubtedly spread the disease in an otherwise clean drove.

Briefly, the following points should be emphasized:

Pasteurize skim milk before feeding to calves, hogs or chickens.

Keep tubercular cows or cows not tuberculin tested separated from hogs.

When purchasing hogs for breeding purposes ascertain if they have been in contact with tubercular cattle or if hogs have died occasionally in a suspicious manner or from an unknown cause.—J. G. J.

RICE BRAN

The American Miller says:

"Both rice bran and rice polish make excellent finish feed for hogs, though continued feeding of them is not to be considered; rather, they should be alternated with corn and oats.

"The rice bran excels the polish in protein and fat content. The polish is high in carbohydrates and is fed as a mash, mixed with bran, to secure the best balance. The darker varieties of the rice bran have been found to be the most nutritious.

PROVIDE FOR SEWAGE DISPOSAL

The two greatest conveniences of the home are a system of running water and a sanitary method for disposing of sewage. A sewage disposal system changes the farm from an unhealthy to a healthy and pleasant place to live—a place where the disease breeding fly will cease to flourish because its food supply will have been taken away.

A Boar to be Great

must stamp his individuality upon his offspring and they must measure up to a high standard of excellence.

The get of Vaughn's Jones court comparison with the get of any boar in the state. Come and see them, they will please you.

A. J. Van Cleef Riverdale, Cal.

Lendorris Liberty Bond and Young Jumbo

assisted by BUSTER LEN comprise our battery of herd boars

From the standpoint of popular bloodlines and individual excellence they are unexcelled.

Our sow herd is worthy of mating with our three good boars. The young stock for sale have the size and feeding qualities so much desired.

We solicit your correspondence.

W. L. Haag and Son Hanford, Cal.

Giant Bob, Grand Champion

and the son of a champion, assisted by Golden West King and Blue Valley King are three reasons for the popularity of our herd and indicate why you should join our rapidly growing list of customers.

These three boars are siring the class of pigs the public demand. Write us regarding your wants. We feel confident we can please you.

A. Buckland & Son, R.F.D., Fresno, Cal.

The Grand Champion Giant Bob

highest priced boar in the West heads my herd.

He is ably assisted by The Sequoian, a young herd boar of great promise. These two boars are siring a fine lot of big growthy pigs. They are the right type. Spring pigs, both sexes, $25 and up.

Z. M. Dickey Dinuba, Cal.

Aviator A boar of outstanding individuality and one that is proving to be a sire of unusual merit. His pigs find a ready market. Order yours today. Satisfaction assured.

CROSS BROS MERCED, CAL.

King's Big Bone Leader

is siring the big stretchy kind of Poland Chinas so much in demand. Giant Bob 2nd is justifying our expectations as a young boar of great possibilities.

These boars and their get will meet with your approval.

Les McCracken Ripon, Cal.

Trewhitt's Big Type Poland Chinas

are found in many of the leading herds on the Coast where size and quality predominate. Select your Poland Chinas where the big type ONLY are bred. When you secure a Trewhitt bred Poland China you get something better—not just ordinary.

W. D. Trewhitt Hanford, Cal.

I AM OFFERING

exceptional values at present. A few bred gilts left. Some choice pigs ready for shipment. Write for prices, they are reasonable. Full description sent on request.

Eugene Miner Lodi, Cal.

Satisfied Customers

are my specialty. Recent sales to old customers prove to me that Forrestview Bob, a son of Caldwell's Big Bob, is siring the class of pigs that have made this great family of hogs famous.

Write me your wants. I strive to please.

J. H. Cook Paradise, Cal.

For easy feeding, early maturing Poland Chinas,

Secure the Get of Model Big Fellow

He was Reserve Grand Champion

at the last state fair and is a sire of remarkable worth. I solicit your patronage.

J. F. McSwain Merced, Cal.

McCune's Quality Herd

of BIG TYPE POLAND CHINAS

attained their prominence only by constructive breeding and careful selection as to type, size and quality. This should be the deciding factor in seeing that your next Poland China comes from this herd.

H. D. McCUNE, Lemoore, Calif.

Facts in BLACK & WHITE

Purebred Holstein Cows Lead

After a 6-year study of dairy operations on over 20 farms in three different parts of Minnesota, Prof. Cooper of the State Experiment Station finds that dairying is most profitable in the "Holstein Section" of the state.

In 1905 the average profit per cow was only $10.10. In 1909, it had increased to $38.45 per cow, or 43 per cent. on capital invested. Increase was due to improved herds, purebred Holsteins having been substituted for grade beef breeds. As soon as dairying is put on a systematic basis, the Holstein cow comes to the front. If facts and figures mean anything to you, send for our illustrated literature.

April 24, W. T. Dice and Harrold Waltz, Hanford.

Holstein interests will be interested in the following information contained in a letter from Stalder Bros., proprietors of the Rosamaines Rancho, Riverside, concerning the performance of the daughters of their herd bull, King Pontiac Netherland Segis 3d: "We now have on test the twentieth daughter to freshen of this great young sire, Aralia Netherland Segis, who calved at the age of two years and one month. She has just made a record of 18.15 pounds of butter in seven days and a seven day milk record of 441.7, or an average of 63.1 pounds per day; best day, 64.9 pounds. This milk record is the best by a small margin of any of these daughters, several of whom have beaten 60 pounds per day. She has six sisters, however, who have surpassed her in butter, the highest producer, Minita Segis Pontiac, having a seven day record of 22.47 pounds butter. The average production of these 20 daughters at an average age of two years and two months is 17.70 pounds butter in seven days, showing the wonderful consistency, as a sire of producing cows, of this young sire, himself still under six years of age. This fact is still further exemplified by the performance of the only five of these daughters to come in with a second calf. The highest of these, Mamie Pontiac, made 25.37 pounds butter in seven days at the age of three years and two days, with an average for four heifers of nearly 23 pounds, while the fifth, only four days on test, is going at the rate of 24 pounds in seven days, at the age of three years and one day."

Alex M. Wilson, superintendent of the swine department for the Italian Vineyard Company of Guasti, reports business excellent and that it is hard for them to produce enough Berkshires to fill the demand. Several choice sows bought in the East have excellent litters by some of the best boars in the country, those sired by Real Type showing especially well. If Mr. Wilson carries out his present plans, he will have quite a show herd at the fairs the coming season.

Announcement has just been made that the senior three year old Holstein heifer, Hollywood Lilith Pontiac, owned by W. J. Higdon, Tulare, has made a seven day record of 36.207 pounds butter from 514.4 pounds milk. She is still on test and it is more than likely that the above record will be increased although the above butter production places her at the front of her class in this state. She was sired by Hollywood Lilith Palmyra, the sire of Lilith Marcena, with a recent record of 38.88 pounds butter in seven days. Her dam is a 21 pound granddaughter of Pontiac Korndyke. Hollywood Lilith Pontiac will be sold in the Higdon sale to be held May 5.

The Winsor Ranch Duroc-Jersey herd at Bonita, San Diego County, is in excellent condition. The spring litters by Winsor Giant Orion and Great Sensation 3rd are showing up in great shape. Most of the litters are ten to 12 pigs each. A good bunch of yearling gilts of Orion, Pathfinder and Sensation breeding are grazing on the alfalfa and will be in fine condition for the big sale in July. The Winsor Ranch is one of the best equipped hog plants in the state and has every facility for producing high class breeding animals on a large scale.

George Stingle of Lark Meadow Ranch, El Monte, is steadily improving his herd of Berkshires and has some outstanding spring litters. In addition to booking orders for spring pigs, Mr. Stingle has a few bred sows and gilts and two boars of serviceable age that are priced at very reasonable figures.

Fred Hall of Perris reports the best business he has ever had with his Shorthorns and Berkshires. His trade has taken all his bulls of serviceable age and he could sell many more if he had them. He has also sold all the Berkshire gilts he can spare at present. His young herd boar, Model Leader 3rd, is one of the best candidates for the senior yearling class at the state fair we have seen. He is siring the right sort of pigs, which is the real test of any herd header.

Thos. Harrison, proprietor of the Santa Rosa Stock Farm, Santa Rosa, writes that owing to the fact that he is forced to relinquish his lease of the Santa Rosa fair grounds he finds it necessary to dispose of a large part of his herd of milking Shorthorns and that he contemplates holding a public auction when he will offer between 40 and 50 head, including a number of prize winners. The Harrison milking Shorthorns are known throughout the Pacific Coast section, having been prominent in Western show rings.

W. T. Hollingshead and son, Orland, have recently sold Durocs to the following purchasers: A bred gilt to C. B. Cunningham, Orland; a bred gilt and a service boar to B. J. Bills, Orland; a bred gilt to Arthur Erickson, Orland; bred gilts to J. M. Ashley, W. E. Beason and Smith and Hurni of Orland. T. W. Mayhew and C. Judges of Willows have each taken two bred gilts. Messrs. Hollingshead report that one sow in their herd has farrowed 16 pigs.

Miss Konigen Pontiac, a senior three year old daughter of King Pontiac Konigen, owned by the Bridgford Holstein Company, Patterson, has just been given a seven day record of 31.47 pounds butter and 772.3 pounds milk, and a 30 day record of 125 pounds butter and 3,235.5 pounds milk. The 30 day milk record is claimed to be the world's record.

Plans are being made to organize an association to hold an annual county fair in Stanislaus County. The movement has the backing of the city of Modesto and Stanislaus County as well as the support of all the livestock interests. Modesto plans to purchase a tract of 70 acres for the site the county expects to erect the buildings on and the livestock breeders will build a show and sales pavilion.

J. F. Simmonds of New South Wales, Australia, recently visited a number of the leading Holstein herds of Sacramento Valley. Mr. Simmonds expects to return to this state later and will probably make selections of breeding stock for shipment to Australia. Simmonds says that there is a growing field in the South Pacific and it is his opinion that California is the logical source of supply.

The American Polled Hereford Breeders' Association announces that a breed promotion sale will be held at Fresno, May 5. It will be remembered that the association held a promotion sale at Sacramento last year. It is planned to sell about 30 head and the association states that the quality will be much better than last year.

H. E. Spires of Hilcrest Farms, writes: "Some seven day records made lately in the Victory herd are: Dora Hamilton Korndyke, three years, milk 515.0 pounds, butter 20.048. Liela Korndyke Hengerveld, three years, milk 576.6, butter 27.015. Victory Pietertje Pontiac, two years, junior, milk 394.6, butter 18.73. Victory De Kol Mary Pontiac, two year junior, milk 282.2, butter 13.112.

THE REASON WHY

Diner—That man at the round table gets much better food and attention than I do. I shall complain to the manager. Where is he?

Waiter—He's the man at the round table, sir.—London Opinion.

Modesto Holsteins to New Men

One of the largest crowds ever seen at a California auction attended the first sale held under the auspices of the Stanislaus County Holstein Breeders Association. It was estimated that over 1,000 men and women were about the sale ring at one time. Indeed, the parking space for cars reminded one of the state fair.

The sale consisted of 39 females and eight bulls selected from eight of the leading herds of that banner dairy county and, with few exceptions, all were taken by new men who are turning from grades to pure breds. The sale furnished abundant proof that California buyers of pure bred dairy cattle are no longer satisfied with animals that have not been tested. The buyer now insists that his purchases must be backed by official records or come from herds where the producing qualities of the cattle have been established by testing. Prices for untested stuff rule but slightly higher than grade values.

Bridgford Holstein Company, Patterson, topped both the female and bull divisions. Pansje Hengerveld Buttergirl, a three year old daughter of Segis Bergsma Butter Boy, that is by the same sire as Miss Aaggie Acme Burke, and out of Pansje Hengerveld De Kol with a record of 27.54 pounds butter in seven days, topped the females. She was taken by R. L. Holmes of Modesto for $775. Agawam 2d, a 25.45 pound daughter of Dutchland Colantha Sir Ormsby, consigned by Bridgford, sold to C. L. Morse of Modesto for $625. Hermana Mechtilde Ciruela 4th, with a record of 18.88 pounds butter, went to W. M. Way of Modesto for $530. Mr. Way was one of the heaviest buyers of the better lots. A. B. Sayers of Manteca, another good buyer, secured Lady Ulrika Bonnie De Kol from the Peterposten consignment at $500 and Hermana Mecthilde Ciruela 3d from the R. L. Holmes consignment at $435. H. A. Stammerjohn of Turlock made a number of very excellent selections from among the tops.

A. B. Sayers took the top bull, Valdessa Pontiac Alcartra Prilly, for $650.

The 39 females averaged $325 and the eight bulls averaged $243—satisfactory prices in view of the number of untested things and the age of many.

A number of buyers from a distance were present, but did not succeed in securing many.

A feature of the sale was the barbecue lunch provided by the Modesto Business Men's Association and the contributors to the sale. The event was managed by C. L. Hughes of the California Breeders' Sales and Pedigree Company, Sacramento. Col. Ben A. Rhoades of Los Angeles was the auctioneer and was assisted by Col. Cy N. Clark of Modesto.

The detailed list of sales follow:

Consigned by E. E. Freeman, Modesto

Use Hercules Dynamite

"It's common sense to do your work the best way —*when that way is easiest and cheapest.* That's the reason I'm advising every rancher and orchardist I know to buy and use

HERCULES DYNAMITE

"It's done many a good day's work for me and put many a hard dollar on the right side of my bank account.

"I figure that Hercules Dynamite does more work on my place than any three men I've ever hired. *And it's always on the job.*

"I use it to plant trees, dig ditches, blast subsoil, clear land and do a hundred other things.

"It's a cinch to learn how to use explosives. Send to the Hercules Powder Co. for their 68-page illustrated book, 'Progressive Cultivation'. This book tells you all about the many ways in which you can use Hercules Dynamite on the ranch and in the orchard.

"You need this book—send for it today!"

Hercules Dynamite is for sale by leading Hardware and Implement dealers

Value of Swine Futurities

By V. F. Dolcini

THE Duroc futurity is on the mind of every Duroc breeder at present and the question now is whether or not he will make an entry for the national futurity. To that question there is but one answer and that is "Yes." Every breeder, large or small, should enter in the futurity by all means and show if possible.

Now the question arises, Is it a good thing to fit young pigs? That question has been definitely decided by proven facts. The fact that most all national associations are promoting futurities and that they have been constantly on the increase since their origin some ten years ago is proof enough of their value and benefit, but when we stop to consider what futurity pigs have done in the sale rings and breeding pens, there is no argument left as to what the advantages are. The highest priced sow in Kern's recent world record sale (and she sold for $5,600) was a first prize futurity winner at the Iowa state fair last fall. Her litter brother, Choice Wonder, was also first and junior champion and sold at public sale for $3,300 (the highest price for a boar of his age at that time). Another litter brother, Choice Wonder 3rd, sold in the same sale for over $1,000. These, with another gilt that went to make up the winning litter, were all sired by Wahaska Wonder, a son of Great Wonder. Then there was the first prize futurity gilt at the National that sold in Kern's sale for $3,400. Getting back to our own state, the gilt that topped the recent Tulare sale, selling of $1,125, was shown in the futurity and was well up in the money. The fact that the leading breeds will pay such prices is proof of what these youngsters will do for them.

Getting back to the breeding pen, I will say from my own experience and what I know of others, that I have never known a gilt to be injured in any way, because of fitting for a futurity. I have never had a winning gilt farrow and raise less than six pigs, and several have farrowed and raised as many as eleven.

Heretofore I have referred only to the under-six-months futurity, which is the only futurity we have had in California up to this time. This year the national Duroc Jersey Record Association, together with the state fair association and the Duroc-Jersey breeders, are planning to put on a senior pig futurity, which I believe will be of as much benefit to the breed as the one for younger pigs has proven, and any breeder having fall pigs that he did not care to force can go ahead and fit them for this senior pig class.

This special class is open to all breeders who comply with the rules and regulations of the futurity and is a class where all breeders, young and old, rich or otherwise, meet on practically the same footing.

The advantages of a futurity show are many: First, a breeder with one sow that farrows a litter after March 1, or between September 1, 1919, and March 1, 1920, can take the litter to the fair and meet the man with a herd of from 20 to 100 sows on practically an equal footing. One need not put a lot of money into his herd before feeling that he can go to the shows and make an exhibit. A start can be made with one good sow or gilt bred to a good boar. The reason I say all are more or less on an equal footing is because the rich man cannot buy a bunch of futurity winners, as the show these pigs will make will depend largely on the care they have since they were farrowed, and pigs that are changing hands will not do as well as those that are handled under the same conditions and on the same feed for the first six months.

Second: In fitting for a class of youngsters one is not wasting any feed, but is putting this feed into bone and muscle to make them worth more money than those that are not grown out so well. There is absolutely no feed wasted in feeding young pigs, as there is in the case of fitting mature animals.

In the third place, the more animals of one breed that are shown, the more value it is for the breed, because it attracts and impresses those interested and encourages more men to make a start with the breed.

In the fourth place it is a big educational factor, as it helps those interested by showing and having a competent judge place their animals as he thinks they will mature. That means that if a man is not thoroughly familiar with the way hogs will grow out, he can get the benefit of the expert's judgment without waiting a year or more to see how his pigs will develop.

And last, but not least, there is the premium money which all are interested in. There are more liberal premiums paid in the futurities than in any other class, and there are eight places in each one of three classes, which means there is a good chance for anyone who has anything that is at all worth while.

The time is at hand and one will have until April 1 to nominate his herd, which will make it eligible for this great show.

If one is going to show, now is the time to start in with the pigs. First see that the sows are getting enough feed to supply the pigs with plenty of milk. As soon as the pigs are old enough to eat, which is usually about three weeks, build a little creep for them and feed them a little slop to get them started eating.

This creep should be built in or adjoining the pens where the pigs are kept. Make a small trough and put in it thin slop of middlings, fine ground barley and oats. Coax the little pigs to eat just as early as possible. As the pigs get to eating well, gradually increase their feed and feed at least twice a day and if possible three times a day. In addition, a self feeder of tankage and bone meal should be kept before them. When the pigs are eating well, as they will be at eight to ten weeks of age, they can be weaned, and if they are getting plenty to eat there will not be much danger of a setback at weaning time. After weaning feed them in much the same way, and if possible allow them to run on an alfalfa pasture. This will give them exercise, keep them in good physical condition and they will make better and more economical use of the feeds fed.

TEST YOUR COWS

"It isn't always the man who is doing the most work that makes the real money with dairy cows," says E. M. Harmon of the college of agriculture, University of Missouri. "Too many men have among their herds cows which not only are not paying but which are actually eating up the profits made by the rest of the herd.

"We are continually finding examples of this over the entire state. One man said recently that when he joined the cow testing association last June he was milking 50 cows. With the aid of the association he eliminated 26 and is making more profit from the remaining 24 than he made on the whole 50. In addition to that he reduced his labor by one-half. A neighbor of his started in a year ago with a herd of 37 milkers. He has reduced that number by 14 with the same result—more profit from fewer cows.

"One man in a cow testing association recently sold a cow which he said was annually losing him more than it cost him to have his entire herd tested.

"After allowing a fair amount for labor and interest in addition to feed it was found that 36 per cent of the cows in the county association last year were losing their owners money. It is safe to say that the cows in this association were well above the average cow. But even using these figures as a basis and granting that only 36 per cent of the 800,000 cows in the state are losing money we find that over 330,000 of them are kept at a loss. In other words the farmers will feed and milk over 330,000 cows tonight and pay those cows for the happy privilege of doing so. There is one way to find out which ones are making the money. That is the use of milk scales and the Babcock test and a cow testing association."

Southern California Holstein Breeders Sale

100 Registered Holsteins

Rhoades & Rhoades Sale Pavilion, Clearwater, Cal.

April 27 and 28, 1920

Yearly record cows and sons and daughters of yearly record cows by yearly record sires.

The Most Sensational Offering

ever made by a single Holstein breeder in California

55—Outstanding Cows, Heifers and Bulls—55

Semi-Dispersal of the famous W. J. Higdon Herd, Tulare, Cal. Wednesday, May 5, 1920

Mr. Higdon is faced with the necessity of plowing up his present ranch and of securing additional land before even a herd of the present size can be maintained satisfactorily, and very reluctantly decided to offer at public sale his entire herd except the young daughters of King Korndyke Pontiac 20th, and possibly a very few of the youngest daughters of Prince Riverside Walker.

King Korndyke Pontiac 20th will be sold!

And no more promising sire has ever been led into a sale ring in the world. Here is the opportunity of the season to buy a herd sire of the very first class.

Five 30 to 34 Pound Cows will be in the sale, including the two that were selected to go to the St. Paul sale.

An Outstanding Lot of Heifers, out of high record dams and of the most popular breeding will be sold.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested and sold subject to retest by the buyer.

COOPERATIVE CITY MILK PLANTS

There is a growing interest in the movement to reduce the costs of marketing milk through cooperative city distribution. Increasing sanitary requirements of city milk inspection departments and mounting costs of market distribution have given a considerable impetus to this movement. Cooperative milk plants are now being operated in cities ranging in size from 15,000 to over 600,000 in population, but generally the cooperative idea applied to city milk distribution has gained adherents more readily in the smaller sized cities where private initiative had failed to develop a satisfactory system of milk marketing. Action has usually been initiated by local dairymen who sought to obviate unnecessary costs by erecting a pasteurizing and bottling plant. These plants furthered more economical city distribution, either through routes operated by the association itself or through sub-dealers to whom it might sell.

Reference to index pages of trade publications would indicate that probably one of the first successful efforts along this line in the United States was that of the Erie County Milk Association of Erie, Pennsylvania. In 1899 approximately 50 local dairymen retailing milk in Erie organized a stock company for the purpose of engaging in the cooperative distribution of the milk produced by its members. At the outset this association consolidated the deliveries made from 65 routes into 23. Although the original amount of stock issued ($30,000) had not been increased up to the year 1917, the current market value of this stock had increased to approximately $150,000.

Since the organization of that pioneer cooperative milk distributing company a considerable number of associations have been organized for a similar purpose in other cities.

MORE GOOD HORSES NEEDED

The thing most needed in the production of work horses for American farms is greater care in the selection of the stallion and the brood mare, say animal husbandry experts of the United States department of agriculture who have been studying the present situation with respect to horses. Not only was there a net decrease of approximately 373,000 in the number of horses on farms on January 1, compared with a year ago, but the experts are of the opinion that there has been an even more marked decrease in the number of mares bred during 1919. The extent of this decrease can not be accurately determined until the colt crop of 1920 is estimated. However, if the decline in breeding is as great as conditions now indicate, the country will be confronted with a seriously depleted supply of good horses within the next few years.

Many farmers are using up their work stock without making any provision for the future. Such a policy is short-sighted and will have serious results. The present need is to increase the percentage of efficient horses by careful selection of parents. One of the principal factors from which the market is suffering is the breeding of too many low grade work animals. There is a strong demand for high class horses at good prices.

WOOL PRICES ON DECLINE

Since November, 1918, the prices of wool have declined in comparison with the same month of the preceding year. The highest average price reached was 60 cents per pound in March and April, 1918, since which time the prices fell to as low a figure as 47.9 cents in April, 1919. In January, 1918, the average price was 58.1 cents; January, 1919, 55.2 cents; and in January, 1920, 53.3 cents. The producers' price of 16.7 cents per pound in 1913 advanced to 58 cents in 1918, and fell to 51 cents in 1919.

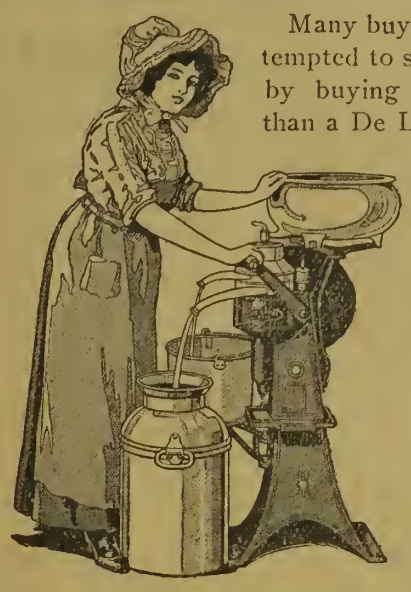
Penny Wise---Pound Foolish

Separator Buying



Many buyers of cream separators are tempted to save $10 or $15 in first cost by buying some "cheaper" machine than a De Laval.

In practically every case such buyers lose from 10 to 50 cents a day through the use of an inferior separator.

That means from $36.50 to $182.50 a year—and not only for the first year but for every year the separator continues in use.

Twice a Day---Every Day in the Year

It should always be remembered that the cream separator saves or wastes in quantity and quality of product, and in time and labor, twice-a-day every day in the year.

Moreover, a De Laval Separator lasts twice as long on the average as other separators. There are De Laval farm separators now 28 years in use.

The best may not be cheapest in everything but it surely is in cream separators.

The De Laval Separator Co.

Registered Holstein Bulls of various ages for sale. Millbrae Dairy, Millbrae, California.

Sunshine Farm Jerseys — No females for sale. Bulls from high testing cows for sale. E. E. Greenough, Merced.

To Make Room for Guernseys will sell 10 or more fine Jersey cows. Cox Ranch, San Marcos, San Diego Co., California.

Reg. Shorthorns—Fair Oaks Ranch, Willits California.

HE KNEW

The good man was shocked when the little boy asked him for a match.

"Do you know where little boys go when they smoke?" asked the good man.

"Yes, sir," replied the boy. "Back of Smith's lumber yard."

Beet Growers in National Convention

In reviewing the recent convention of beet growers of the United States, held in Denver, the magazine Sugar says:

"Beet growers of the United States in their first national convention voted to demand from all sugar manufacturers in the country a sliding scale of prices for beets ranging from a $12 minimum to $21 per ton, the exact figure depending upon tho price for which the season's sugar output sells at seaboard.

"The minimum of $12 is based on nine cent sugar, and for each advance of one cent in the sugar price the beet growers demand an additional $1.50 per ton of beets. The basis is now laid for negotiations with the Great Western and other companies throughout the country. The Great Western recently announced a $12 flat rate contract for 1920 beets. While the national organization will stand behind the higher demand, state organizations may compromise with the sugar companies on a lesser price in case a deadlock is reached, according to announcement from the convention.

"The demand of the Mountain States Beet Growers Association, a constituent member of the national association, was originally for $1 per ton more than the scale adopted in the convention, which in itself represented a compromise by representatives from every beet growing state on the price and contracts committee.

"Another decision reached was to increase tho wages of labor in the sugar beet fields 15 per cent during 1920. This means an advance of about $4 a month per acre cultivated. The percentage will be divided, five per cent on thinning and ten on pulling and topping.

"R. V. Clark, chairman of the price committee, declared in his report that the 'interests of the beet grower, manufacturer and the public must be considered in fixing a scale of prices for sugar beets.' He asserted that in demanding a scale which averages about $4 a ton more for beets than Colorado growers have ever received that it does not necessitate any advance in the price of sugar to the housewife.

"As stated above the scale adopted by the convention is based upon the selling price of sugar at seaboard. The scale is as follows:

Sugar Price	Beet Price
9 cents lb.	$12.00
10 cents lb.	13.50
11 cents lb.	15.00
12 cents lb.	16.50
13 cents lb.	18.00
14 cents lb.	19.50
15 cents lb.	21.00

"The beet growers do not anticipate sugar dropping below nine cents at the factory in 1920 and their minimum demand for beets is $12 per ton. The present factory price is 12 cents."

The magazine adds: "The claim of some beet growers that they have been losing money on their crops simply proves that they are unfit to raise beets, and probably would do much better hiring out by the day to more efficient neighbors," and gives instances wherein long returns have been made by growers in different states.

BUILDING DIKES AND DITCHES WITH A TRACTOR

By W. H. Goodwin

Dikes with a system of ditches for surface drainage purposes are very important on land which is flooded for rice or fields which are low and are covered by tidewater or river overflows.

Low dikes can be readily made by plowing a ridge or back furrows with a good gang plow so that the furrows overlap each other and are raised above the normal level of the field. By plowing a width of some ten to 15 feet on either side of this back furrow enough soil can be secured to form a dike. After the first plowing a ditcher or similar implement can be used for pushing the loosened soil towards the crest of the ridge. By pushing from opposite sides the dike can soon be raised from one to three feet above the normal level of the field. Sometimes it is necessary to plow a second set of furrows after the soil is pushed towards the crest of the dike, going eight to ten inches deeper than the land is normally plowed.

Where the land is very wet and soft, the crawler type tractor with its large tractive area will successfully operate under very adverse conditions and will also deliver close to its rated drawbar pull under these conditions and do the work in a surprisingly short time.

Where the rice fields are level, with not much more than six or eight inches difference in level between the opposite ends or edges of the field, these dikes with long, sloping banks enable the harvesters or binders to pass directly over the dikes without interference or trouble in crossing them.

Where large dikes of considerable width and height are necessary, they are more readily built by using the plow and a wheel scraper with the tractor as the motive power. With the crawler type tractor it is possible to handle the largest sized wheel scrapers and to build dikes very rapidly.

Dikes or embankments should be built in the fall, allowing the winter and spring rains to settle them, thus forming a much more effective and permanent embankment than when built shortly before they are used. Where the flood waters or the river currents affect the banks by washing, it is sometimes necessary to stake the brush with long, slender stakes, so that it will not be washed out of position. This is also very effective in confining small streams where the flow of water is not large except during flood periods.

IRRIGATION PUDDLING

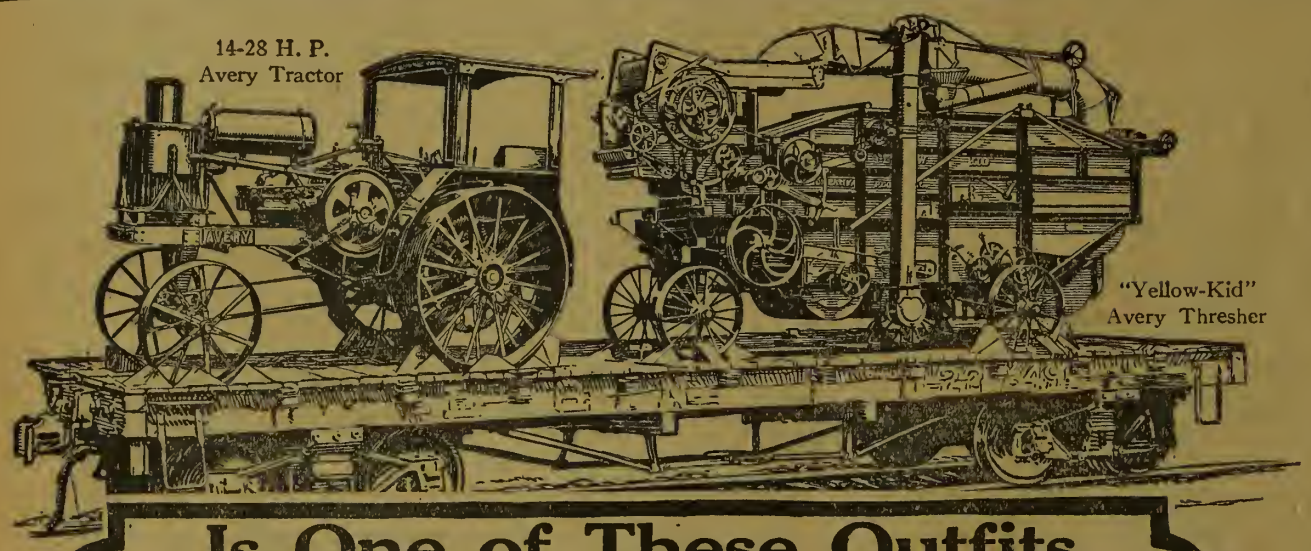
Wild flooding naturally is easier than check flooding, but the inevitable puddling due to the current of the water with the former method is bound to grow worse with each successive watering. Sand and other coarse soils naturally are not greatly affected, but the best of irrigated lands are fine textured and these suffer most.

The remedies and preventive treatments that may be used for puddling are, first, to keep in the ground as much organic matter as possible; and, second, to keep down the motion of the water. It is the decided flowing movement that runs the particles of soil together and not the mere floating of the particles which takes place during any proper saturation.

Check flooding is easily done on level areas, though the bother of throwing up the furrows is considerable. The same result can be secured with wild flooding and without levees by blasting the under soil. The condition created by this treatment is that three feet, four feet, or five feet of soil permits the rapid percolation and distribution of water, without permitting the setting up of any current. The soil particles are lifted, but not carried along.

In handling this system the blasting must be done when the ground is thoroughly dry, even at the depth the charges are to be placed. Charges must communicate, and if they are sufficiently close so there is no decided ridge of unbroken ground at the lower reach of the gases between blasts better results will be obtained. Just enough water should be let in to fill the soil to within six inches r a foot of the surface, but this supply should be fed as fast as the loosened ground takes it. It will filter through at a surprising rate.

In addition to eliminating puddling (and that without levees), this system keeps tho water definitely under control and does away entirely with washing. One blasting should serve for a number of seasons when tho crop rotation and surface cultivation is right



Is One of These Outfits On the Way to You?

DO you realize what this 14-28 H. P. Avery Tractor and Avery Thresher could do for you? With it you could Averyize all your farm work. With the tractor you could do your spring plowing *on time*—get your seed bed in condition for a bumper crop. You could use the tractor not only for plowing but also for pulling harrows, drills and similar tractor-drawn tools. Later you could use it for pulling the binder and operating the thresher. Also for filling the silo, sawing wood, grinding feed, pulling road graders, etc. You could use this Avery Tractor profitably *every month* in the year.

This is one of the six sizes of Avery Tractors built with "Draft-Horse" Motors, renewable inner cylinder walls, adjustable crankshaft bearings, kerosene gasifier, etc., and "Direct-Drive" Transmission which gives you the greatest percentage of the power at the drawbar and *all* of it in the belt, and which is always in direct-drive in high, low, reverse or in the belt.

With this Avery Thresher you could do your own threshing. Not only thresh when you are ready and at a lower cost, but you can also be sure of saving your grain with this thresher, for it made the champion grain-saving record of 99 9-10%, which beat even the government tests.

All Avery Threshers are equipped with "Guaranteed-for-Life" Cylinder Teeth, Avery I. X. L. Grain-Saving Device and Roller Bearings which mean an extra light-running, steady, long-lived machine. And they are backed by the strongest definite grain-saving guarantee given with any make of separator.

This motor farming outfit is exactly what you need to hold down your farming expenses. Replace hired help and animal power with motor power this year and raise bigger crops at lower costs. See these and other Avery machines at your nearest Avery dealer's.

The Avery Line

includes tractors for every size farm. Six sizes, 8-16 to 40-80 H. P. with "Draft-Horse" Motors and "Direct-Drive" Transmissions. Two small tractors, Six-Cylinder Model "C" and 5-10 H. P. Model "B." "Self-Lift" Moldboard and Disc Plows, Listers and Grain Drills, "Self-Adjusting" Tractor Disc Harrows. Also roller bearing Threshers, Silo Fillers, etc.

Write for the Avery Catalog and interesting Tractor "Hitch Book." Both Books Free.

Motor Farming, Threshing and Road Building Machinery

Advantages of Grading Farm Products

By H. A. Lyon, Idaho Bureau of Markets, at Northwest Potato Growers Conference, Spokane

THE two most important factors in the future of agriculture are farm management and better marketing of farm products. Handling the farm business and knowing the cost of production are vital, but nothing interests the farmer so much as marketing his products at a maximum price. For years we have been advised and instructed how to raise more and better crops. We have also been advised how to combat diseases and pests, but very little help has been given the producer in obtaining the top price for what he has raised. The middleman has been the marketing agency. He has given the producer his market information. And it has been the shipper or middleman who has graded our farm products.

In speaking on "The Advantage of Grading Farm Products," I do not present a new subject. Your products have always been graded by someone. When you have sold your wheat, pigs, hay, etc., the buyer has told you that they were good, fair, or poor and paid you accordingly. The people of Idaho have felt that it would be preferable to have an impartial state official grade their product and for some months a rigid inspection service has been maintained. Practically every car of hay, potatoes or fruit shipped from Idaho has been inspected and a certificate of grade issued. The increased returns to Idaho, because of its well-graded products, must be measured in thousands of dollars.

Our inspection service is only a few months old. It is so new that we from Idaho are sometimes startled at its growth and the benefits are so decided that they surprise even us. A very few years ago, California oranges—then ungraded—arrived on the Chicago market, showing 30 per cent to 40 per cent decay. And now the quality of an orange is never considered only by grade.

I'll take you into a secret—Idaho has had the poorest potatoes to market in her history and yet they have topped the markets of the country in 1919. Our apples were badly diseased and we hate to think of the reputation which would have been sure to come without a rigid inspection. There is no argument against grading farm products and it has taken but a short time to convince us in Idaho.

And now let us summarize the benefits to be derived from grading the products of the farm. In the first place, quality always sells and official grades and grading place the quality beyond dispute. A satisfied customer is the best asset any business man can have and when the consumer gets a box of Washington or Idaho apples and is pleased, the label on the box impresses him.

Official Grades Beyond Dispute

The middleman has a sound business when he can buy your product on an official grade for the contract is made on that grade and it is left to an impartial official to decide that grade which tends to eliminate the friction between buyers and sellers, that dispute which we are all so familiar with. And then, too, the producer can ship his crop to a far-off market with considerable security because of the certificate of grade which accompanies the bill of lading and the car. And just here, let me say that the Idaho department of agriculture will fight to protect its certificates.

In times past the shipper has bought the commodities of the farm and often knew little about the contents of the car only that it contained apples, spuds, etc. He has been a gambler and has awaited returns with anxiety. Thousands upon thousands of tons of products which should never have left the farm have been shipped over the country, the freight has been paid by someone and much needed freight cars have been wasted by the shipment of junk. You may say that you are not interested in the middleman, but until you have some better method of marketing you must accept his service. And to the middleman you carry life insurance against unexpected death, fire insurance against the unexpected fire, but is there a more practical insurance against the purchase of a poor product and the shipment of the same to market where it brings you financial loss and the loss of your reputation?

The establishment of official grades and an efficient inspection service is the biggest factor in better marketing. It tends to stabilize the farming industry. Let us remember that the product which we sell, the product which reaches the market bearing the name of our state tells to the world the character of our people and the character of our state's agriculture.

A REAL ELEVATOR

Visitors to the Yosemite national park in the near future will not be compelled to remain on the floor of Yosemite Valley because of the dangerous roundabout trip to the summits of the cliffs above. Instead they will enter an elevator, to be quickly hoisted through 3,164 feet of solid granite and step out on Glacier Point at an elevation of 7,214 feet above sea level, according to the April Popular Mechanics Magazine, where the undertaking is fully described and illustrated.

This elevator was planned several years ago, but the actual construction was regarded as an almost impossible feat of engineering. Work is to begin at once, and it is expected that the elevator will be in actual operation within a year. The plan also calls for the erection of a power house near the foot of the shaft, where hydro-electric power will be developed from the Merced River for the operation of the lifts.

A SPECIAL plug for YOUR engine

THERE is a Splitdorf Green Jacket Spark Plug best suited for every type of engine—one cylinder or many cylinders—two or four cycle—"T", "I", or "L" heads—deep or shallow plug recess—with or without water-jacketed spark plug hole—truck, tractor, stationary, motorcycle, passenger car or marine.

And the Splitdorf Spark Plug—"The Plug with the Green Jacket"—is leak-proof and break-proof. Insulated entirely with East India Ruby Mica, it cannot chip, break or crack. There's no porcelain to break to put your plug out of commission.

Splitdorf Green Jacket Spark Plugs cost no more than porcelain plugs. A set simply means "no more plug trouble." Splitdorf Green Jacket Spark Plugs are absolutely guaranteed against breakage.

Send for booklet which designates the right type of plug for *your* car, truck or tractor engine.

RICE

The California market generally remains practically level, although there are a few lots available slighty under the market. Export inquiries continue to come into the market. The trade firmly believes that the next two weeks will see large orders being consummated.

BEANS

Jobbing price per cwt.: Small white, 6.20@6.25; large white, 6.00@6.35; cranberry, 6.90@7.00; red Mexican, 8.00@8.25; pink, 6.20@6.35; California Bayo, 9.00@ 9.25; blackeye, 7.10@7.25; red kidney, 13.00 @13.35; lima, 11.00@11.25; Garvanza, 9.00 @9.75; Kotenashis (in bond), old crop, 5.25; new crop, 5.75.
Dried Peas—California, 5.25@5.40 per cental for green, recleaned.

HAY

Under date of March 20, Scott-Magner & Miller says:
Receipts past week 840 tons. Most of these receipts were cheat from Oregon and alfalfa from Nevada. Very little California hay is moving this way owing to the fact that stocks are fast becoming exhausted and dealers are turning their attention to outside points for supplies. Choice wheat hay and especially choice red oat hay are very scarce and demand top prices. As the Oregon product from the Willamette Valley is selling at about $10 per ton less than our California hay, many consumers are taking to it.
The recent gentle rains have had a most beneficial effect on growing crops, especially in the Bay sections and grass is growing very rapidly. As the grass feed improves the demand for hay is becoming less. The entire market can be reported as easier.
We quote today wholesale prices in carload lots as appear from dealer's transfers upon the hay market in San Francisco, for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat Hay (light 5 wire bales)	38.00@40.00
No. 1 Wheat or Wheat and Oat Hay	35.00@38.00
No. 2 Wheat or Wheat and Oat Hay	33.00@35.00
Choice Tame Oat Hay	37.00@40.00
Other Tame Oat Hay	37.00@40.00
Wild Oat Hay	Nominal
Barley Hay	Nominal
Alfalfa Hay	32.00@37.00
Stock Hay	29.00@32.00
Oregon Chea. and Oat Mixed	27.00@29.00
No. 1 Barley Straw, per bale.	.70@ 1.00

Citrus Markets

Los Angeles, March 24, 1920.
The orange market has been a bit shaded. There has been some little difficulty with puffs, more with the excessive proportion of large offs. Sweets and Mikes, partly because of sizes, have been favorites.
On the other hand lemons are looking up a bit. There are 130,000 foreign lemons in port. This is a much greater supply than last year but not as great as two years ago same date.

Shipments

Shipments of citrus fruit to date from Southern California since November 1, 1919: Oranges, 11,881 cars; lemons, 2,303; total, 14,184. To same date last season: Oranges, 11,617; lemons, 2,959; total, 14,576. From Central California this season: Oranges, 2,528; lemons, 292; total, 3,800. To same date last season: Oranges, 2,265; lemons, 249; total, 2,514. From Northern California this season: Oranges, 260; lemons, 20; total, 280. To same date last season: Oranges, 234.

Big Hatches of Hardy Chicks

YOU can hatch that sort from your own hens. Just keep them healthy and vigorous. And you know that's mostly a matter of making their feed digest.

Pratts Poultry Regulator

makes the feed do its work. Makes your flock hardier so that the chicks you hatch will be stronger and easier to raise.

When your hatches come off, start your chicks on

Pratts Buttermilk Baby Chick Food

You'll find it puts vigor into your youngsters when they need it most—in the first three weeks.

Samoset Farm, Augusta, Maine, used it last season. The proprietor, H. J. O'Hear, says:

"In feeding Pratts Baby Chick Food I find that it has eliminated the so-called baby chick diseases that we have had so much trouble with in days gone bye. It has proven a bone and muscle maker, and a developer of chicks in the shortest possible time."

"Your Money Back if YOU Are Not Satisfied"

Sold by 60,000 dealers. There's one near you.

Poultry Producers' Business Under Full Steam

By J. H. Barber, General Manager

ASSOCIATION egg receipts made a big jump in January, averaging 5,136 cases a week as compared with 3,310 in December, an increase of 55 per cent. Operating expense per case consequently decreased considerably, being 44 per cent less. The expense for January exceeded the one per cent per dozen allowance, but this will be offset by the larger volume of business in the spring months.

Total receipts of eggs at San Francisco for January were six per cent less than last year, but the direct shipments from Petaluma were very much heavier. As there is no record of last January's shipments, an exact comparison is impossible.

Members will be interested to note that during January and February we have shipped to New York just 60 carloads of eggs containing about 30,000 cases, or 360,000 dozen. This is not far from half the total New York shipments from Petaluma and San Francisco during the two months. With the exception of two cars, every car sold to date has made a profit. In other words, the eggs sold for more in New York (after deducting the expenses) than they would have brought if sold here instead of being shipped. We stated in our letter of February 14 that the additional amount realized by selling in New York, after establishing a reserve fund to provide for possible losses on future shipments, will be distributed to the members quarterly on the basis of their deliveries. The directors set aside $20,000 for the reserve, as appears on the January 31 statement, and from present indications when all the returns are in there will also be a good sum to distribute on March 31.

Checks for the dividend of six per cent on stock are being mailed to the stockholders. Fractional stock balances are also being refunded to members desiring it. Quite a number have preferred to pay in the difference and get another share of stock. This is very gratifying, as it shows confidence in the stability and permanence of our organization.

With the packing season opening on March 1 the question of the price of eggs for storage becomes a matter of immediate concern. The poultryman who is paying more for feed and for everything else than he was last year, naturally feels that he should get more for his eggs. The question is, can he get it? If the matter began and ended right here in California we wouldn't bother to ask the question, but we are all well aware that it is the price in the great egg producing Middle West that will determine our price, as well as that of every other section of the country. What we can do, however, to a considerable extent, is to see that our price represents the full value of our eggs in relation to the Eastern markets.

The difficulty is that our packing season in California begins a month ahead of the East and Middle West, so that both dealers and producers here have to rely on their judgment at the opening of the season. There is some guidance to be had in the prices at which contracts for April delivery have been and are being made in Chicago. Such prices represent the judgment of operators as to what the actual price will be in April. Contracts have been made, we are told, at prices varying from 44½ cents down to 40 cents for Chicago firsts, April delivery. One of the largest handlers of eggs in Chicago told us recently that he believed that Western firsts ought to go into storage at 35 cents. This gentleman cheerfully admits that he is a bear on the market, and also says that he hasn't sold any futures for less than 41 cents.

If the export situation could be cleared up by some adjustment of foreign exchange rates we would cease to worry. There would be nothing to worry about. Without that adjustment it seems likely that we Americans will have to eat more of our own eggs this year. Even a return to normal exchange would not now absolutely insure us the export business we want. There has lately developed a possibility of Russia opening up, and Russia has always supplied a large proportion of the eggs used in England and other countries of Western Europe.

So the situation is full of possibilities, the best of which is that there is still a profitable demand in New York which seems likely to continue well into March. Taking this into account, with the sales of April futures in Chicago, makes us feel quite hopeful of storage prices at least as high as last year, if not higher. We ourselves feel that we can well afford to store our eggs at last year's prices with a reasonable certainty of not losing anything on them.

POULTRY PRODUCERS SECURE CLAIREMONT EGG PRESERVING PROCESS

Those who read the market reports will remember frequent and favorable mention of "processed eggs," especially during the last year. The process referred to is the Clairemont process for sterilizing eggs, which has been found to stand the test of time and to be all that was hoped for it. And now, of a piece with the usual enterprising and progressive methods of that corporation, the announcement is made that the Poultry Producers of Central California, Inc., the big growers' organization which handles about half of the eggs produced in the central portion of the state, has just acquired the patent rights for California to the Clairemont process.

The process was invented some years ago by Victor Clairemont, a well known figure in the egg world, and after a long and exhaustive series of experiments was patented by him in its present form. Its use on a large scale by the poultry producers association will mark an epoch in the conservation of one of our most important foods—fresh eggs.

Like all great discoveries, the process itself is quite simple but thoroughly effective. It preserves unaltered for an indefinite period the pristine freshness of the new laid egg The process consists essentialy in subjecting the fresh egg to a high degree of heat for a few seconds only. This rapid application of intense heat completely sterilizes not only the outside of the egg but also the small amount of air that exists inside the shell of a fresh egg. Simultaneously the outside of the egg is coated with an absolutely neutral preservative substance which seals up the pores of the shell, preventing the access of other air and also preventing evaporation of the contents of the egg. The entire process is accomplished in a few seconds by an electrically operated, automatic machine, and takes place so rapidly that the delicate contents of the fresh egg are not in the least affected. Both the white and the yolk remain absolutely unchanged and, best of all, their freshness and their unrivaled nutritive qualities are conserved indefinitely by this remarkable sterilizing process.

In the use of this process by the Poultry Producers of Central California, Inc., even the heat will be applied electrically and controlled by delicate thermostats to a fraction of a degree. Only absolutely fresh eggs of the highest quality will be used, delivered daily by the producers at the association's packing plant at Petaluma—the biggest egg packing plant in the world. Specially made cases will be used for the delivery of these eggs and the process will be conducted throughout with perfect sanitation so as to secure an absolutely pure product.

The Clairemont process is not a new thing. It is long past the experimental stage. Eggs conserved by this process have been marketed for several years by two of the most fastidious egg dealers in San Francisco, but only in a small way for the simple reason that they were not able to obtain a large supply of the high quality eggs which are necessary for the perfect sterilized product.—Petaluma Poultry Journal.

Poultry Queries

Conducted by J. A. Koethen

White Pekins

Does it pay to raise green ducks? If so, how are they raised, that is, as to most economical feeding methods and care?—Subscriber, Los Angeles.

This question was referred to J. W. Deyoe and he answers:

"The best breed for production of young ducks for table use I consider the White Pekin. You will note they bring from three to five cents more a pound than any other breed. Age for marketing depends uopn the manner in which they are fed. If properly fed and cared for they will market in from eight to ten weeks. However, they will continue to grow until about three months, at which time they should be nearly full grown. As to best method of feeding, baby ducks should be fed hard boiled eggs for the first two days, third day hard boiled eggs with an equal amount of bran and about 25 per cent of sand, fourth day and up to two weeks, bran 50 per cent, corn meal 25 per cent, sand 25 per cent. After two weeks reduce the amount of sand to about 15 per cent and continue this feed until they are ready for market, with all of the green they will use from the time they are first put in the brooder house.

Bloody Droppings

Can you tell me what makes my growing chicks eat their droppings? Sometimes the droppings are pure blood and the chicks soon prefer them to other feed. Sometimes the chicks that have blood in their droppings get thin, otherwise the flock seems perfectly healthy.—Subscriber, Wasco.

Those bloody droppings are an almost certain indication of coccidiosis. Pick out the affected chicks if you can and give them the following treatment: If you cannot segregate the sick ones give the treatment, which is recommended by our own experiment station, to the whole flock. Sour milk or buttermilk is the only cure that has been found for coccidiosis, but it must be made a very large part of the ration in order to be effective. Feed a small ration of grain morning and night, and keep mash before the birds for an hour or so in the middle of the day only. Keep the milk before them in fountains all the time. The droppings will be thin after they are on this milk ration, but the blood will disappear gradually, and a cure may be looked for in about three weeks. The well chicks must not be permitted to eat the bloody droppings. Clean out brooders and coops thoroughly in the morning, and put all the chicks on range if you can manage it in any way. If you cannot, you will have to keep cleaning up the droppings and spading the ground in their run.

Moving Sitting Hens

This has been considered a difficult matter, but Mrs. B. P. M. writes as follows: "I had a hen due to hatch on the 8th of February and we moved her the 6th of February a distance of 163 miles. All the eggs hatched and nine chickens are alive and doing well."

That was a good hen, Mrs. M.; some hens would have given up the job. Doubtless she was tactfully managed, as well.

Making a Start

I am a novice, having just decided last winter to make a start with chickens, and shall be grateful for a little information. (1) We are planning a double laying house, each section 10 by 20. How many mature birds will such a house accommodate? (2) A setting of bantam eggs, which the hen had taken 24 days to lay, has just come off two days late. Only three good lively chicks were hatched from the eight eggs, though all the eggs were fertile, and all the chicks lived till hatching time, but could not break the shell. What was the matter? (3) I plan to plant seven or eight fruit trees in the chicken yard. What kind are best? (4) Would fruit trees do well in the alfalfa patch? (5) What does "Hoganize" mean? (6) Do you think trap nests would be practical for a woman with a house and little children to look after as well as her chickens?—Subscriber, Madera.

1. Allowing four square feet of floor space to each hen, you could keep 50 hens in each section of the house. Many poultrymen keep more than this when the hens have yards to run in, but as you are a novice I think you will find 50 hens better than more. If I were you I would not try to fill them both this year. Fifty hens are a lot of work and if you make them do their best, keeping them and their house clean, and feeding them with care, they will keep you busy.

2. Yes, the age of those bantam eggs was largely to blame for the poor hatch, but not altogether, probably, for the fact that the hatch came off two days late shows that the temperature was too low. Some hens have not the requisite amount of heat in their bodies to be good hatchers, and I suspect the bantam is one. But hatching eggs should not be more than ten days old, and two weeks is the very limit. Next time mark each egg with the date when you bring it into the house, and do not set an egg that is more than two weeks old.

3. Peaches, plums and apricots are all good in the chicken yard. Figs are perhaps a little better than either if you can pick the fruit before it falls. Oranges are better still if you keep them cultivated and watered.

4. You can plant trees in the alfalfa if you leave room around them for cultivation, but I believe the walnut is the only tree that really thrives under such conditions. Walnuts should be planted 50 feet apart, they say, so there is a good deal of room for other things.

5. "Hoganize" means to measure the hens' capacity according to the Hogan system. If you can put a certain number of fingers between her keel and her pelvic bones, and the pelvic bones themselves are sufficiently thin and elastic, you may expect that the hen, if she is properly fed, will lay a certain number of eggs in a year. The Hogan system picks out, in a general way, the better layers in a flock, but it does not select the best nor tell you how many egsg they have laid.

6. I think you could put eight or ten of your earliest layers in a house by themselves and trap nest them without much trouble, and you would get a good deal of fun out of the work. It is not necessary to trap nest all the flock nor to trap nest all the year. The only difficulty is, that some one must always be at home to let the hens out, that is, in the forenoon. Very few hens lay in the afternon.

Sick Baby Chicks?

There is only one way to deal with baby chicks and that is to keep them well. Doctoring a hundred or more chicks is mighty discouraging work.

It's pure carelessness to lose more than 10 per cent of chicks, from hatching to full growth. Many lose 40 per cent to 60 per cent, and even more. No profit in that.

Our book, "Care of Baby Chicks" (free) and a package of Germozone is the best chick insurance. WITH BABY CHICKS YOU MUST PREVENT SICKNESS—NOT ATTEMPT TO CURE. "I never had a sick chick all last season"—C. O. Petrain, Moline, Ill. "Not a case of white diarrhoea in three years"—Ralph Wurst, Erie, Pa. "Have 800 chicks now 5 weeks old and not a single case of bowel trouble"—Mrs. Wm. Christiana, Olive Ridge, New York. "Two weeks after we started last spring we were a mighty discouraged pair. Every day from three to six chicks dead. A neighbor put us next to Germozone and we are now sure if we had had it at the start we would not have lost a single chick"—Wm. E. Shepherd, Scranton, Pa.

GERMOZONE is a wonder worker for chicks, chickens, pigeons, cats, dogs, rabbits or other pet or domestic stock. It is preventive as well as curative, which is ten times better. It is used most extensively for roup, bowel trouble, snuffles, gleet, canker, swelled head, sore head, sores, wounds, loss of fur or feathers. **25c, 75c, $1.50 pkgs. at dealers or postpaid.**

Milkoline **will help make your hens lay more eggs.**

Feeding Milkoline

will make you more money —reduce mortality of your flock— keep flock healthy and less liable to disease.

Increase Poultry Profits

Any poultry raiser can easily double his profits by doubling his egg production. Feeding **Milkoline** with other feed greatly assists assimilation, keeps digestive organs vigorous and is a wonderful appetizer, tonic and bowel regulator. **Milkoline** contains nutritive elements vital to egg production and not found in grain rations.

13,000 More Eggs

Jas. E. Keyes, Petaluma, Calif., says: "After feeding **Milkoline** for eighteen months to 2,500 hens, I find that worms cannot exist in poultry where **Milkoline** is used. I reduced mortality with laying hens 10 per cent. I increased the egg production of my flock **thirteen thousand eggs** in one year. Feeding **Milkoline** to laying hens keeps them in splendid health thereby preventing disease and derangements of all kinds."

Lowers Feeding Cost

Many feeders say **Milkoline** lowers feeding cost one-third, because their hens assimilate all feed they eat. Our liberal **Guaranteed 30 Day Trial Offer** enables you to try **Milkoline** at our risk—to prove that it will make you mighty good money.

Milkoline

has a base of modified buttermilk with essential fats and acids added. **Milkoline** comes in condensed form. Will not mould, rot or sour. Keeps indefinitely in any climate. **Milkoline** is simply **"Good Buttermilk Made Better for Feeding."** Flies don't bother it.

Prevents Disease

Milkoline is not featured as a cure for anything or a preventative, but due to the acidity in the buttermilk it is a germ destroyer and helps keep poultry healthy, which is the best preventative against disease. **Milkoline** is invaluable as a life saver for baby chicks.

PRICES

These prices are F.O.B. Kansas City or the address of our nearest dealer. Dealers in all parts of the United States.

5 Gal. Keg	$7.50
10 Gal. Keg	12.50
15 Gal. Keg	16.50
32 Gal. Barrel	32.00
55 Gal. Barrel	49.50

Prices on smaller packages given in booklet. Buy in barrel lots—it saves you money.

Only 2c a Gallon

For feeding mix one part of **Milkoline** to 50 parts of water (small feeding 5 tablespoons to gallon of water). Feed either with water or mash feed. **Milkoline** keeps their appetite keen and its action is highly essential to normal egg production. When fed as directed **Milkoline costs only 2c a gallon** or less. Trauhaft & Newman, Lankershim, Calif., say: "We would not go back feeding straight buttermilk at any price."

Guaranteed Trial Offer

Milkoline has been producing so many amazing results and we are so certain of what it will do for you that we will ship you 1 Gallon for $2.25, **express prepaid.** Take 30 days—feed half to your poultry. If not entirely satisfied simply return unused portion and we will refund every cent you paid us. No charge for portion you have used. **Milkoline** is legally guaranteed to be satisfactory. You are always the judge. We suggest ordering larger quantity—you get the benefit of lower price—you risk nothing—you must be satisfied or we refund every cent you paid us. **Make this test now.** The sooner you begin using **Milkoline** the quicker you will be making money.

The Reliable Blue Flame Wickless Oil Heated Hover

This Hover Represents Our 30-Inch 42-Inch and 52-Inch Sizes.

THE MODERN HOVER

This hover has the same chick capacity as the coal burning brooder. They are made in four sizes, 18 inch, 30 inch, 42 inch and 52 inch hover. A few of the special points on this oil heated hover are as follows:

- Burns Coal Oil
- Steady Blue Flame
- Comfortable and Easy to Operate
- Economy of Operation
- No Wick to Trim
- No Oil Fumes
- Visible Oil Feed
- Convenient and Safe
- No Coal, Smoke or Gas
- The Flow of Oil is Regulated Automatically.
- Abundance of Heat

AN EASTER SONG

Sing a song of Easter,
A song of happy hours,
Of dashing spray and shadow play
And lovely spring time flowers.
Of birds come home again to build
Beside the cottage eaves,
Of waking buds and rushing floods
And dance of rustling leaves.

Sing a song of Easter,
A song that means a prayer,
Of want and love to One above
Who keeps His world in care;
A song for all on this green earth,
For dear ones passed away.
Sing clear and strong the joyful song,
The song of Easter day.

Sing a song of Easter,
A song of pure delight,
A song that starts in merry hearts
And swells from morn till night.
An Easter song that children lift
Without a jarring chord,
That thrills afar from star to star,
To praise the children's Lord.
—Harper's Young People.

THE MESSAGE OF THE BULBS

SHE had planted the bed on the sunny side of the house, beneath the sitting room windows, thinking to please the child himself. But, alas, how much may happen between the planting and the springing of a flower!

It was in the last days of mild September when Margaret Quimby set the crocuses in lettered lines that she hoped the sturdy five year old would be able to read when they emerged. It was early December when the boy died from the swiftest and most terrible of children's diseases.

After that Margaret gave herself up to hopeless grief and George Quimby, her husband, began to go often to the village. They avoided looking into each other's eyes lest either betray to the other the weight of sorrow that rested upon both their hearts.

Long ago they had drifted somewhat apart, though it was hard to tell why, for they had started out with as much love for each other as is possessed by the average untried young couple. But Margaret had been under 19 when they were married and had found the duties of a farmer's wife none too easy, and perhaps George had not been as considerate as he might. There was considerable debt on the farm and he found it required a struggle to make both ends meet. Possibly neither had managed very well, but while the baby lived he had been an effective bond and a perpetual inspiration.

It was for him that they had rebuilt the house—that Margaret had raised more chickens yearly that she might furnish it neatly and clothe him well—for him she had planted shrubs and flowers, and for him George tilled the ground with unusual care and tried to improve his stock.

They knew, of course, that the boy could not possibly appreciate these things, yet his presence with them urged them constantly to do their best in every particular. Unconsciously they realized his future judgment of them and governed themselves accordingly, and as the child grew older, more observant and able to express himself, he controlled their actions to an even greater degree.

They gave up the habit they had formed of nagging each other, because when such conversation occurred before Charlie he was sure to turn to his father with a puzzled look and the inquiry:

"Mamma c'oss, Poppie?" Or to his mother with the question:

"Poppie mad, mamma?"

Margaret donned a fresh afternoon dress of cheery color as often as possible because Charlie always greeted it with a clapping of hands and the cry of—

"Pity co'es, pitty co'es," and George gave up his pipe because the youngster had once made himself sick sucking a rank old stem. Once, too, when he had dropped an ugly word in the child's hearing the baby's clear voiced query:

"What you say, Poppie?" had made him turn aside with an embarrassed laugh and vow inwardly never to use such language again.

He "hitched up" weekly and took his family to church because the boy seemed to enjoy it and displayed great pride at being allowed to join the infant class at Sunday school.

Other children had been denied them, but they were well content with their treasure until, between two days, the dear form stiffened and the baby spirit ventured alone behind the darksome curtain that enshrouds so much of hope and happiness, when existence became purposeless for them and utterly unprofitable.

Each believed the other the least afflicted by their mutual trouble.

"If she felt as I do she couldn't put everything belonging to the child out of sight and keep on as she does," George thought.

For Margaret toiled harder than ever with a feverish activity that secured her sound sleep at night, while he lay awake for hours tossing in nervous despondency. He would have liked to talk of the child, but at the first word Margaret always stopped him with a forbidding gesture. She dared not give way to the storm of emotion she knew such mention would bring upon her.

He chanced to find a paintless jumping jack, over whose loss the boy had grieved a few days before his death, and hid it away behind a beam. Sometimes when his loneliness grew unbearable he touched the foolish thing and it seemed to comfort him. When this failed he fled to the genial society of the hotel bar-room.

He was not a loafer by nature, but any place was better than the one where every nook of field or barn, house or shed, cried out its emptiness of the chief thing that had made life bright, and the ready, cheerful chatter of the hotel group, composed largely of traveling men, drummers and agents from the bigger cities filled his mind to the exclusion of other thoughts, while their liquor "treats," in which he shamefacedly shared, occasionally took the place of the heartless seeming meals that Margaret prepared so regularly at home.

"If he had any feelings he couldn't hang 'round with that drinking gang down there," she judged.

Once or twice when he had come back with unsteady footsteps and loosened tongue she had turned upon him a look of withering disgust from which he shrank even in his befuddled state, and so the breach between them widened daily.

When spring came she had put the house in order and raked the yard long before he had set a plow in his fields. But the farmer's instinct is hard to kill and the springtime wakens it as surely as it does the northward impulse of the birds. One Saturday morning Margaret saw George harness his team and start his "pulverizing." The sight encouraged her a little, for food must be eaten and interest paid whatever happens, and if George's idleness became confirmed the out-

The costs of bringing tea from the tea-plant to your kitchen are almost as much for poor tea as for fine tea; and, in both cases, these costs are more than twice the tea-garden cost of the teas themselves.

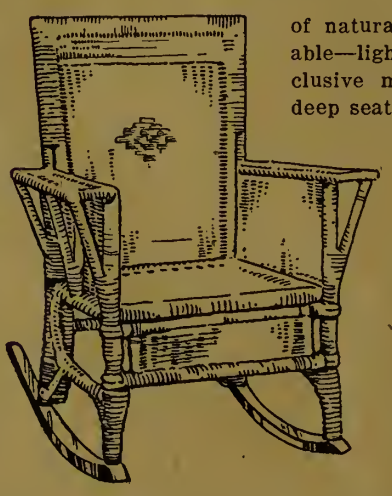
So why pay all that good money to bring over tea that isn't half so good?

Schilling Tea is your fine economical practical tea, full of the real tea-flavor.

There are four flavors of Schilling Tea — Japan, Ceylon - India, Oolong, English Breakfast. All one quality. In parchmyn-lined moisture-proof packages. At grocers everywhere.

A Schilling & Co San Francisco

This Big Easy Rocker



of natural chinese reed, springy, yielding, comfortable—light in weight but very strong—graceful, exclusive model—roomy and comfortable with wide, deep seats and broad, generous arm rests—

Delivered Postpaid Anywhere in U.S. for **$12.75**

Chair to Match, Same Price

These chairs have just been received as part of a shipment said to have been the largest of its kind ever made to a retail store in America. In the regular way they would sell for $21.00 each. Our immense purchase gave us such a cost saving that we are able to share with Mail Order customers in the form of this remarkably low price.

Roomy, Substantial, Comfortable Chairs

Seats are 18 in. deep and 18½ in. wide. Height of back, 23½ in. Height over all, 37 in.

Suitable for any room of the home or for porch or garden. They are light enough to be moved about without exertion.

And to crown their many good qualities they are collapsible—may be taken apart and folded into small space for carrying or storing, yet their construction is so simple and strong that rigidity is not impaired nor is it readily apparent that they are collapsible after they are set up.

$12.75 Brings Arm Chair or Rocker Transportation Prepaid. Only one each to a customer. **$12.75**

Complete Furnishers of Successful Homes

look for doing either was poor.

She started a better dinner than usual, but toward noon, after the rural carrier had passed, she saw her husband tie the horses and walk toward the mail box. She supposed he would be coming to the house to leave the daily paper and get a drink at the pump, but when she looked again she saw the harrow deserted at the headland, while George, his team transferred to a light wagon, was driving rapidly toward town.

"Must be hard up for whisky," Margaret commented bitterly. She set the dinner things away and for once spent the afternoon in brooding. It occurred to her that it was Easter Saturday and she remembered how busy she had been other years coloring eggs for Charlie. It was through tear-swollen eyelids that she saw her husband returning late in the afternoon.

She noticed that he staggered a little as he came from the stable after putting up his team, but his face was too pale to suggest intoxication, and a fear of fresh misfortune seized upon her as he entered the kitchen and laid before her two narrow strips of written paper.

"There's our finish, I guess," he said hoarsely.

Mechanically she read the papers. They were notes, each calling for the immediate payment of $30, and signed waveringly and unmistakably by "George Quimby."

"Maybe I was boozy," he confessed, when she lifted dully questioning eyes to his downcast face, "but I thought it was all right when that fellow asked me to sign some recommends for the Burdick binder, because it is a good one. But there must have been blank spaces above my name and they've written the notes there. I've been to see Judge Grantly and he says it's a common swindle but the notes have been sold and I'll have to pay. I can't prove anything against 'em."

She rose up blazing with sudden anger. "You fool!" she cried. "You've let yourself go till you're no better than a drunken sot and now you've ruined us. Do you s'pose I'm going to stay here and help pay such debts as that?"

He turned upon her with equal fire. "Do you s'pose I care what you do? I see how much you think of me or anything else. I'm goin' to sell out. You can have anything that's left after the debts are paid. All I want is enough to take me so far that I'll never remember I had a home."

He flung out of the house and did not return to it that night. At the barn he took out the jumping jack and threw it far from him into the gathering twilight.

"I might's well," he said to himself. "Everything else is gone."

Margaret sat long that evening pondering her future course. She knew that George meant to do as he had said and she had no wish to oppose him. She would go to her sister in the city—conditions would be easier there, she thought—and find work. She could never be happy again, of course, but the prospect of almost any change was a relief after so many weeks of sodden despair.

Strangely enough, George's face was the first image her mind presented when the Easter sunshine streaming [illegible] the room woke her next morning [illegible] filled with downcast bitterness [illegible] had seen it last night, or stupid [illegible] misery as it had been at the funeral, but brightened by the smile with which he had used to greet her during their courtship. She thought of how good he had always been to the boy and how generous he had sometimes been to her. She wondered what would become of him after the break up.

She opened the windows and set water to heating, then wandered out of doors. The sky was blue and cloudless, a soft breeze brushed her forehead, down in the village a church bell rang clearly insistent, robins and song sparrows trilled near at hand, from the pasture bars a meadow lark called that it was "Spring o' the year." Lilacs were budding and the maple at the gate was a glory of golden blossom. At the side of the house she stood breathless as before a miracle.

George, soberly currying the horse that had drawn his family so often to meeting on Sabbaths like this, was thinking of her. She had not seemed so heartless when she had yielded to his wooing. He remembered how she had looked when he had first seen her with the baby in her arms. Certainly she had loved the child during its lifetime. Probably much of their trouble had been his own fault. But there was no use trying to make up now. Of course Margaret wouldn't.

Glancing toward the house, he saw her fall to her knees and crouch there curiously. He hurried toward her and paused motionless himself. There before them was plainly traced in silken petaled flowers of yellow, blue and white the letters of their son's name.

"Charlie!" His bright curls seemed to wave before them, his laughing eyes peeped from the cerulean chalices, his innocent soul looked forth from the snowy one—reproachful, questioning, yet wholly loving.

George had known nothing of the bulb planting. Margaret had forgotten it. The floral wonder was equally startling to both. The woman uttered a stifled cry and rushing into the house threw herself upon her bed. Thither George came to her a little later bearing a cup of tea. She stretched a hand to him.

"Maybe I hadn't ought to go," she whispered.

"Maybe he'd want us to take hold an' try it again," George breathed.

"We could sell the colt and a cow or two to pay the notes," Margaret planned practically.

"An' maybe we could find some homeless little kid—not to take the place of ours, of course, but just to remind us of him. I believe Charlie'd like us to have a little fellow 'round," George dreamed.

"Anyway, we'll have each other," Margaret concluded, and after that they were silent while the balm of the Easter morning soothed their troubled minds and the healing message of the blossoms renewed their souls.—Farmer's Wife.

CONCERNING EGGS AND EASTER

Eggs are so connected in our thoughts with the celebration of Easter that the origin of their use in this connection seems lost in the dawn of history. And in truth it is, for the custom of giving eggs at Easter can be traced to the theology and philosophy of the ancient Egyptians, Persians, Gauls, Greeks, Romans, and so on, among whom an egg was emblematic of the universe, the work of the Supreme Divinity.

Among Christian people eggs have been used time out of mind at this season as an emblem of the Resurrection, because of an egg's retaining the elements of a future life, for the chicken entombed, as it were, in the shell is, in due time, brought to life. The coloring of Easter eggs is said to have originated among the Christians of Mesopotamia, who stained the eggs red in memory of the Blood of Sacrifice.

An egg contains all the ingredients necessary to support life and develop the organism. Like milk, it is a complete food, for out of it the entire structure of a bird—bones, muscles, nerves and all are developed. But although the type of a perfect food, eggs are not intended to be eaten exclusively, any more than any other food. They are deficient in starch and should be eaten with bread, potatoes or rice.

But to come back to Easter. Don't let it go by without coloring eggs for the children and letting them find them on Easter morning where they are hidden in nests in the grass or in the garden or on the porch behind the climbing vines or potted plants. Better still, let the children do the coloring themselves and each one be allotted one side of the house or garden in which to hide for the others the eggs he colors or decorates.

Then if each child may make for one of the others a little basket in which to collect the eggs, he or she finds it will add to the happiness of the days before Easter as well as of Easter morning itself. Little baskets of pasteboard covered with tissue paper or grasses or wild flowers, on the order of May baskets, give chance for individual taste and ingenuity and at no expenditure in money furnish happy hours and good training for hand and eye, as well as exercise of loving generosity in fashioning something for another's use and pleasure.—R. D.

HOT CROSS BUNS

For Good Friday:

Easter comes early this year, on April 4. That brings Good Friday on April 2. So the Cultivator gives you this recipe for Hot Cross Buns in good time.

Rub a quarter of a pound of butter into two pounds of flour and add a pinch of salt. Into a glass of fresh yeast stir a pint of warm milk and gradually stir this into the flour until it forms a light batter. Cover and allow to rise. Then work into it by means of a wooden spoon half a pound of sugar, half a grated nutmeg, half a pound of currants, one egg and a half teaspoonful of allspice. Knead well, cover again and allow to stand until perfectly spongy. Then knead into buns, cut a cross on top, let it rise until light, cover with a clarified sugar and bake 20 minutes.

Save 1-2 on Fuel

CHEAPEST HEAT YOU CAN BUY

The Sievert Oil Burner burns either distillate or kerosene oil in cook stoves, heaters, furnaces, pasteurizers, boilers, prune dippers, dairy sterilizers, etc. Absolutely safe, odorless, very convenient and low priced. MAKES HEAT AT HALF WHAT WOOD AND COAL COSTS. Install it yourself. Write for circular and prices on different sizes. Address Sievert Oil Burner Co., 710 North Main St., Los Angeles.

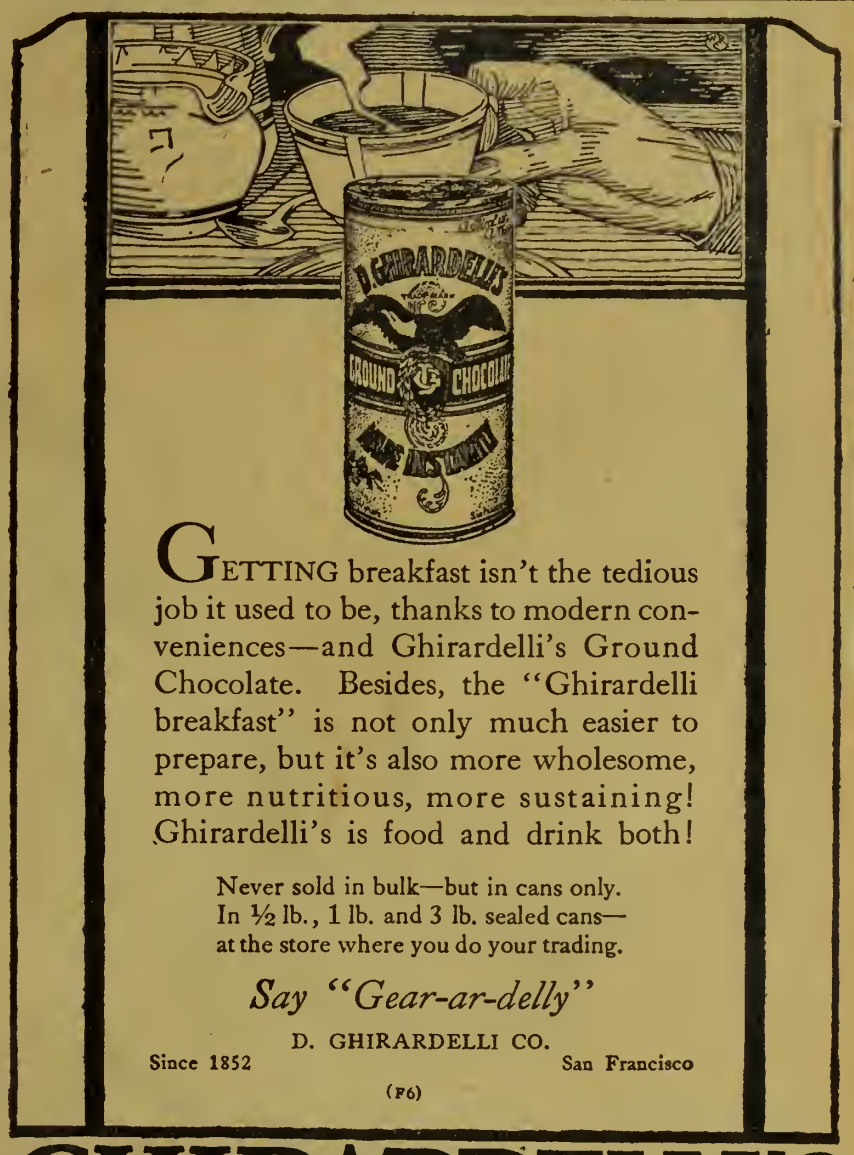
Dye That Skirt, Coat or Blouse

"Diamond Dyes" Make Old, Shabby, Faded Apparel Just Like New.

Don't worry about perfect results. Use "Diamond Dyes," guaranteed to give a new, rich, fadeless color to any fabric, whether wool, silk, linen, cotton or mixed goods,—dresses, blouses, stockings, skirts, children's coats, draperies,—everything!

A Direction Book is in package.

To match any material, have dealer show you *"Diamond Dye"* Color Card.



GETTING breakfast isn't the tedious job it used to be, thanks to modern conveniences—and Ghirardelli's Ground Chocolate. Besides, the "Ghirardelli breakfast" is not only much easier to prepare, but it's also more wholesome, more nutritious, more sustaining! Ghirardelli's is food and drink both!

Never sold in bulk—but in cans only.
In ½ lb., 1 lb. and 3 lb. sealed cans—
at the store where you do your trading.

Say "Gear-ar-delly"

Sturdy chicks mean sturdy profits —and SUREGROW gives you both!

It is the one feed that is always sure to produce a thrifty growth—a growth that goes a long way toward future profits. From the time they are five weeks old until they are twelve weeks old—chicks need, above all, bone and muscle. You can't expect them to mature into good layers or good *breeders* unless they have a good, strong framework to build on.

And that's exactly what Sperry SUREGROW gives them. It contains the essential food units your chicks must have to produce a good, healthy growth. It's surprising how many chick troubles—such as indigestion, moping, slow growth—all disappear once you start them going on this balanced ration.

SUREGROW is more than a uniform, top-grade feed. It is an *investment* that will come back to you many times over in the increased health and vigor of your flock. It means sturdy chicks and sturdy profits!

And here's where you'll find our booklet—"Makes Hens Happy"—a big little help. For it gives you the practical advice of practical poultrymen—32 pages full of help and guidance. Simply cut out the coupon and mail today—it's *free!*

Some Worth-While DONT'S

By GEORGE R. McLEOD
Agricultural Department
Sperry Flour Co.

Note: These terse hints by a practical poultry expert are worth reading and heeding. Every poultryman is more or less familiar with them but, in the rush of things, he is apt to forget them. So, keep the list handy—and use it as a frequent, friendly reminder.

Don't buy chicks with a small amount of vitality.

Don't blame the feed you are using without questioning yourself as to the care you are giving your hatch.

Don't figure on ventilating your brooder through the window.

Don't forget to keep an even temperature.

Don't forget to thoroughly clean all receptacles for feed and water every day.

Don't buy the lowest priced feed—buy the best obtainable.

Don't add animal protein to proprietary feed—there should be enough in it to give the best results.

Conclusions of an Ignorant Cowman

By A. L. Spellmeyer

OUR country was founded by a race of pioneers, vigorous and independent, physically and mentally unaffected by precedent, and finally formulating and endorsing a creed of liberty and ideals which in less than 150 years has become the model government of a weary and pessimistic world.

The majority of these fathers of our country were experienced farmers and stockmen and their laws were based upon the primer principles of economics and the fact that raw earth is the source of wealth. The demand for fur, which a previous generation deemed a necessity and which today we consider a luxury, was responsible for the early exploration of our country. The fur hunters and trappers reached out into the wilderness, established trails, found mountain passes and started the outposts of civilization, and the cattlemen followed to hold the unknown portions of the West, then came the homesteaders and farmers who developed it.

In this age of diverse opinion and turmoil, conditions have developed which menace the contentment, prosperity and well being of the people of our nation. The figures of the Chicago economist, S. A. Baldus, indicate that stock inflation has placed a cumulative and perpetual burden upon the average family of $300 per year and that profit taxes and such makeshifts merely are added in advance to goods before they are sold, and in reality paid by the consumer, and that the percentage system of figuring results in general profiteering. As compared to the tax upon each family income owing to watered capital, the interest on our war debt appears to be a mere $50 yearly to the family, and while a contributory cause for intolerably high priced food and clothing, is not the basic cause.

If the evil is as deeply imbedded in our national life as the above theory would indicate, it will take years of wise legislation or one great panic to bring matters to a fact basis and secure readjustment with the dollar representing a dollar value in commodities and not 35 cents in value and 65 cents of fiction, as it is too much to expect that ordinary business honesty and the principles of a Humble Carpenter of Nazareth expounded 1900 years ago, will be followed by our banking, commercial or union leaders.

In every crisis that our country has experienced leaders or circumstance have eventually guided the nation towards progress and a greater prosperity, and today while a few million union men and a few hundred thousand dealers in capital and credit are engaged in a tug-of-war, the seven million farmers are according to indication about to take the political helm and guide the ship of state to a safe harbor. The political future and domestic policies will not be guided as many have thought by our boys from the war, nor by the labor unions, nor by the banks, but by the farmers and livestock men of the country whose very living has been made uncertain by continued manipulation and injustice.

Whatever may be wrong, it is a fact which cannot be denied that production is suffering and that the world demands more food and products than we are able to give at present. It would indeed seem foolish to prophesy hard times or panics until production has equalled demand, and from autos to alfalfa hay there is a shortage.

The surest way to increase production is to make it profitable, and notwithstanding the opinion of the misinformed neither farming nor livestock growing is today generally profitable, considering the difficulties and expense incurred. Thousands of men have quit the cattle business in the West and hog raising is in any parts unprofitable, and with meat retailing at 40 cents per pound up this is a condition due entirely to profiteering and the handling of middlemen between the producer and consumer. Cattle and sheep are essential to the prosperity of the farmer and soil fertilization. Hides are today about the same to the rancher as in 1914, in fact, in many instances they were then higher,-(Continued on Page 585.)

Fair Weather or Foul—
It's all in the Day's Work

PATRIOT

Motor Trucks

Lincoln Model Patriot Truck hauling supplies for the Charter Oak Copper Co.

Holman Bros. Ranch Co., near Stockton, Cal., making eight four mile trips daily, hauling faur and ane half tons of wheat to the load, on a Washington Model Patriot.

Be sure that the truck you buy will not fail in emergencies—"the unexpected that always happens."

In "fair weather," Patriot Motor Trucks give that dependable, efficient and economical service that every truck owner has the right to expect.

And, as a "foul weather truck," the Patriot will surprise you with its equally dependable, efficient and economical service, no matter how bad the road, load and weather conditions may be.

Good roads, bad roads, or no roads at all—it's "all in the day's work" for the Patriot. This truck is always ready for trouble.

Planting Citrus Trees

By F. H. Nusbickel, before Citrus Institute

PRESUPPOSING that you have already secured the best fruit wood reproduced on nursery trees, your next step is to give these trees the proper environment. Many good trees are allowed to die each year from improper handling. The first thing to do is to decide the distance apart to plant the trees. In doing this you must take into consideration your soil conditions. In a rich heavy soil citrus trees may grow much larger than in loose stony soil. For all ordinary conditions our growers are spacing their trees 20 by 20 or 22 by 22. The 20 by 20 spacing allows for 107 trees to the acre; the 22 by 22 for 90 trees. It is sometimes advantageous to measure off the space to be planted and divide by the number of rows, thus securing a small variation from the spaces just mentioned and giving the grove a better proportion. For those inexperienced in laying off groves I might briefly state the process.

Let us mentally plant a grove 20 by 20, placing the first row of trees ten feet from the property line. First square the corners of the space to be planted ten feet from the property line. Having stakes at all four corners, drive laths at every 20 feet between the corner stakes on all four sides of the square. It will now take three men to "sight in" the tree stakes. We will call the lines around the square the baselines. It is essential that these base lines be accurate. One man sights across the field standing at the first stake from one corner, sighting to the corresponding stake on the opposite side of the field; the second sights between the first laths at right angles to the first man. The third man holds a pole in line with the two who are sighting. When he brings his pole in line with both "sights" he places a stake in the ground at the intersection marking the position of the tree to be planted. By quickly moving from row to row the three men can cover a big space in the course of a day. This method has several advantages over stretching a wire along each tree row and measuring along the wire. In rolling ground trees placed by sighting are always in their proper alignment; in measuring on a knoll or hillside the wire and measuring rod does not take into consideration the irregularities of the ground elevations and the result many times is a very irregular planting. Often the wire is not stretched in true alignmeut and the result is a disappointment. In addition to being more accurate, this method has proven quicker and consequently more economical than the wire method. If the space to be planted is larger than 400 feet, intermediate base lines will facilitate sighting.

Having placed the stakes where each tree is to be set, make a space board or "yoke" of one by four material about six feet long, with a V notch in the exact center; also one by one notches in each end. Place the center V notch to the tree stakes previously set and drive small stakes at each notch at the ends of the planting board, taking care to have the planting board in line with the intended irrigation. Otherwise your side stakes may be disturbed when the irrigation furrows are made. Nothing must disturb the end stakes until the trees are planted. Having set the end stakes, you are ready to dig the holes. This part of the planting has often been slighted to the detriment of many promising orchards. In a rich loam the hole should be at least 20 inches across and 18 inches deep. To secure this give to each man digging a "T" made of two pieces of wood, one 20 inches long and the other 18 inches long; one end of the 18 inch piece nailed to the center of the 20 inch piece and at right angles to it, forming a "T". The 18 inch piece will give him the proper depth and the 20 inch piece the width. By inverting, one can place the 20 inch piece to the bottom of the hole. Often the holes narrow down to six or eight inches at the bottom without this "T" as a reminder.

A Ready Made Orchard

The impatient orchardist who wishes to plant his trees in the morning and gather the fruit at evening may be accommodated, for nurserymen are now ready to supply trees not only ready to bear but with fruit already on. Here is one plot taken at San Dimas.

In stony soils a much larger hole will give the trees a better start. Two years ago a planter in the Upland district dug his tree holes four feet wide and four feet in depth and then prodded with a crowbar for possible rocks below. He screened the top soil which went back in the hol s, irrigated the filled soil, redug smaller holes and planted his trees. I believe that his holes cost him $2.50 each. He planted 1,106 loose root trees in a hot spell in the middle of August. Every tree soon had a nice bushy top. Sixty-five days after planting most of them had started a vigorous second fruit wood growth, and if you could see these trees today you would be convinced that this man was justified and well repaid for his extra care in planting.

In digging the holes place the soil all on one side in two piles; this leaves the opposite side for the irrigation furrow. By placing the top soil in one pile and the bottom s il in the second pile you have good aerated top soil to place in the bottom of the hole when planting.

In preparing your land, do not grade off good soil and plant in the subsoil. Small trees will not grow satisfactorily in this subsoil. If it is necessary to grade, be sure to dig big holes and fill in with rich top soil and then build up the subsoil around by fertilizer as fast as possible. Next plow the irrigation furrow as near the holes as practical. You are now ready to order your water and trees prepared for delivery. This should all be done before the trees are brought on the ground, otherwise one is tempted in the rush of the work to slight the preparation for the trees.

Perhaps a few words about the time of planting would be appropriate. Balled trees can be planted at almost any time of the year except late fall and early winter. From our observation they do best when planted from March to July. In the case of loose rooted trees I am of the firm opinion that they should not be planted until the soil warms up in the spring. If we have an early spring loose rooted trees can be planted to advantage on the lighter, warmer soils the latter part of April, but on the heavier soils planting should be delayed until May. Our best plantings have been in June, after the soil is thoroughly warmed. Contrary to general opinion, we have had exceptionally fine plantings after a hot spell in June and July. If the nursery trees are made dormant in the nursery, packed with care, set carefully, and settled with plenty of water, our experience from planting thousands of loose root trees under many varied soil and climatic conditions in California and lately in Texas convinces us that the safest time to plant loose root trees is in the latter part of May and in June in California and in March in Texas; in other words, after the soil is warm enough for the trees to respond quickly.

At this time let us discuss briefly the respective merits of the balled and loose root tree. The nursery trees grown in a heavy soil have a strong tap root with little, if any, fibrous lateral roots. The nursery stock grown in light, loose soil, in addition to the tap root develops many laterals and fine fibrous roots, which experience has taught us is of great importance to the transplanted tree. We therefore believe you should demand that your nursery stock be grown on light soil. In order to ball a tree it is necessary to cut off all lateral roots three or four inches from the center and the tap root 12 inches long. In comparison, the loose rooted tree has its tap rot cut 16 or 18 inches long and in addition retains many of its laterals and fine fibrous hair roots. In transplanting this gives the loose root tree a greater advantage. Again, in taking out a loose root tree one can easily examine the roots and trim out any crossing roots, and if there is a decided twist or "return bend" on the root, the tree can be discarded. Discarding trees which have imperfect roots eliminates future root trouble and is the greatest advantage in favor of loose rooting trees. In a balled tree the roots are inclosed in a ball of earth and consequently there is no way to determine their condition. Therefore the trees with imperfect roots which should be discarded make seemingly good balled trees as the twists or return bends are concealed. Again, the balled tree from a heavy soil planted in a loose soil sometimes does not get sufficient water. In running down the furrow the water permeates the lighter soil easily and does not thoroughly soak the ball of heavy soil. Often, in instances of this kind, the ball of heavy soil has to be taken out after being in place for a year or two, and cracked in order to get sufficient water to the roots to make a satisfactory growth.

The loose root tree requires more careful handling than the balled tree. When there is any doubt as to the care of the trees when planted, as in the case of resets, they should be balled. But we have found that in new plantings or where the trees get consistent uniformly good care the percentage of loss with loose root trees is very small. Another advantage of the loose root trees is the ease with which they can be shipped. Much can be saved in this manner. Still another advantage is that the second year the loose rooted tree grows better than the balled tree. For these various reasons we strongly advise planting with the loose root method.

To successfully transplant a loose root tree it is necessary to start in the nursery. The tree must be thoroughly dormant. To secure this the tops should be cut back about a week or ten days before transplanting and the ends of the cuts waxed. At the same time a trench should be dug alongside of the tree and the tap root cut with a sharp instrument, the earth being refilled. After a week or teu days the buds will begin to swell and the trees should be carefully lifted out to preserve their roots. They should then be scrubbed, the roots carefully inspected and the trees

(Continued on Page 572.)

Agricultural News Notes of the Pacific Coast

Northern California

Siskiyou County wants a farm adviser.

Sacramento County is now sending out heavy shipments of asparagus.

Packing of spinach will soon be begun in the canneries of Oroville, Butte County.

Irrigation is the big topic of discussion at farm bureau meetings throughout the Valicy.

Cherry growers of Napa County recently met at Napa to form a marketing organization.

The farm bureau of Livermore, Alameda County, has resolved in favor of absolute exclusion of Japanese.

It is reported that much of the land planted to rice last year will be put into barley because of water shortage.

The big fruit icing plant at Roseville, Placer County, will be enlarged to care for an additional 150 tons of fruit daily.

Reports from almond growing sections are to the effect that slight, if any, damage was done to almonds by frosty weather.

Butte County is preparing to entertain the traveling farm bureau conference which will enter the county on the first day of April.

Farm bureau meetings at which there is discussion regarding spraying for codling moth, aphis and other pests are becoming common.

The directors of the Placer County farm bureau have decided to hold the county fair at Auburn this year. The last fair was held at Rosevilie.

The state motor vehicle department announces that as soon as the license rush is over inspectors will devote their efforts to enforcing the headlight iaw.

C. P. Clausen, who has been with the state department of agriculture, now with the federal department, has gone to Japan to secure beneficial parasites.

A general plan for irrigation of the Livermore Valley, of Alameda County, is being investigated by the irrigation committee of the chamber of commerce.

A mass meeting of water users was held at Auburn, Placer County, on Saturday, March 13, to consider the raise in irrigation rates from $45 to $50 per miner's inch per year.

Proposed federal grades for milled rice were discussed at a formai hearing at San Francisco, March 17. The hearing was heid under the auspices of the federal bureau of markets.

Shasta County has been holding a series of potato meetings and listening to addresses by W. V. Shear of the state department and B. F. Stroup, horticultural commissioner of Shasta County.

Commercial organizations of Northern and Central California met in Sacramento, March 20, to inaugurate a campaign for construction of a national highway over what is now known as the Overland Trail and the Pikes Peak ocean to ocean highway.

Representatives of 12 wool growing counties of the state met at Berkeley last week to discuss pooling wool interests. The plan adopted was to appoint a committee in each farm district to pool wool of growers, the district pools again in turn to be handled in county units.

Central California

Turlock has cannery running on spinach.

Reports from most sections of the state indicate promise of a big wheat crop.

Madera County growers have decided to plant quite largely of Durango cotton.

The Merced County Cattlemen's Association met at Merced, Saturday, March 13.

The Merced County farm bureau held a hog auction at Gustine on March 17.

Commissioner McKinney of Monterey County is conducting systematic squirrel drive.

The farm center at Denair, Stanislaus County, has declared against any effort to put through a daylight saving plan.

The board of supervisors of Stanislaus County has declared in favor of improving the fair grounds at Modesto.

Fig growers of Clovis, Fresno County, have endorsed the movement looking toward the new fig marketing organization.

The conference of apple growers at Watsonvile resulted in determination to secure more rigid inspection of apple pack.

Almost every county in the San Joaquin Valley has thorough organization distributing poison and making drive on squirrels.

The Fresno Agricultural Association has asked the county chamber of commerce to assist in placing the fair on a firm business basis.

One hundred and twenty-five acres is to be planted to cotton in the Turlock irrigation district. Durango will be the variety planted.

The California Bean Growers Association held meetings March 12 at Turlock and March 13 at Modesto to discuss marketing problems.

Santa Clara Valley fears serious inroads because of brown rot appearing in many orchards. The recent weather conditions have been very favorable to the rot.

Bean growers of Stanislaus County recently met at Turlock and took steps to enlarge the scope of the association and greatly increase is membership.

The apple output for the Pajaro Valley last season was 2,719,000 boxes as announced by State Inspector Tate. The bulk of the output was, of course, Newtown Pippins.

Petitions are being circulated for the formation of the West Joaquin irrigation district. Petitions are to be presented to the Merced supervisors the first Monday in April.

The Tulare County Water Users Association is conducting a membership drive. The association will take up the various water, irrigation and power questions as a county problem.

Tulare County proposes to have a genuine livestock show and livestock men are appearing before chambers of commerce and urging greater attention to that branch of the industry.

The Tulare County Water Users Association is making a drive for new members and hopes to secure more general conservation and development of new waters for use of irrigators.

Southern California

Blythe, Riverside County, has a cotton compress.

Los Angeles speculators are talking of organizing a cotton exchange.

Fillmore, Ventura County, is now having a strike among Mexican lemon pickers.

Talbert, Orange County, reports six new dairies recently established in that section.

San Diego County farm bureau recently elected Felix Landis of El Cajon president.

Many bean growers of Ventura County are changing from lima beans to sugar beets.

Banning entertained the Associated Chambers of Commerce of Riverside County on March 16.

Rannels, Riverside County, hopes for highway connection with Niland on the Southern Pacific.

Orange County fair committee is making definite plans for an agricultural fair to be held this fall.

The new West Side packing house at Anaheim, Orange County, expects to begin on Valencias, April 12.

The Claremont Pomological Club met last Saturday and discussed fertilizers and methods of application.

A movement is on foot to use the Polytechnic school at San Luis Obispo for vocational training for disabled soldiers.

Orange County hopes to have the mid summer meeting of the citrus institute organized recently at San Bernardino.

Directors of the Southern California Fair at Riverside are making plans to have a bigger and more representative fair the coming fall.

This is a wonderful year for wiid flowers. All desert sections report such a carpet of bloom as comes only in exceptional years.

The directors of the Imperial County farm bureau have endorsed the calling of a bond issue for $30,000,000 for construction of an all-American canal.

Professor Quayle and Commissioner Morris of Orange County have been making addresses on daylight fumigation before Orange County farm centers.

It is reported that a big tire company has made offer for all the cotton raised in the Perris Valley, Riverside County, at a guaranteed price of 60 cents per pound.

The state highway commission is investigating as to best line of highway from Mecca, Riverside County, through Chuckawalla to Blythe on the Colorado River.

Groups of farmers in the Hemet-San Jacinto Valley are organizing themselves into mutual water companies to sink wells to supply their lands with water this summer.

Imperial Valley shipped out during the month of February 1,127 carloads of produce, Brawley heading the list with 262 cars of lettuce and other truck crops making a total of 367 carloads.

Irrigators of Pomona Valley have so thoroughly brought the storm waters from San Antonio Canyon under control that not a drop has wasted to the ocean. The waters have been spread over a thousand acres of gravel and boulders at the upper edge of the valley.

The Coast and General

A Glendale, Arizona, cotton grower reports a gross income of $681 per acre for his long staple cotton.

The bank at Tonasket, Washington, is financing importation of a bunch of pure bred dairy cattle.

Sherman County, Oregon, farm bureau is endeavoring to find out how much it costs to grow a bushel of wheat.

The Okanogan County, Washington, Livestock Association will meet in annual convention this week and elect officers.

Poultry producers of Washington report that practically 90 per cent have not made cost of production during last six months.

The Hood River section of Oregon produced 70 cars of potatoes; only eight cars of which remained in the hands of producers on March 1.

The Arizona Cattle Growers Association at the recent meeting selected Phoenix as the convention city for the 1921 meeting of the association.

Oregon dairymen are perfecting a cooperative marketing organization and they hope to bring practically all dairy products in the state under one organization.

Reports from Egypt state that the world's record price has been received for the long staple Egyptian cotton, $1.66 a pound having been paid at Alexandria a few days ago.

Charles E. Marshall has been appointed register of the United States land office at Phoenix, Arizona. His appointment was made to fill a vacancy created by the resignation of John L. Irwin.

A cotton grower who has made some considerable study of picking cotton states that cotton which is picked in the early part of the day weighs 16 pounds more per hundred than that which is picked in the afternoon. The quality, however, he believes to be better when picked dry.

F. A. Chisholm, county farm agent of Coconino County, Arizona, is allotting each farmer in the county 20 pounds of prairie dog poison free of charge. Any farmer who desires to cooperate with him will be furnished with the poison free of charge, with instructions how to use it.

Mrs. Mary P. Lockwood of the extension department of the University of Arizona reports that in one school in the north part of the state 94 children were examined relative to the food which they were receiving and not one of these reported that milk formed any part of their diet.

Stockmen in the vicinity of Williams, Arizona, report losses from loco weed unusually heavy this year. Several horses have died from its effects and many others have become locoed. The common supposition that stock on abundant range will not eat the loco seems to be proven wrong this season, as the range is exceptionally good.

The suit brought by the water users of the Yuma reclamation project to enforce payment to the government on the basis of $40 an acre instead of $75 has been decided in favor of the government and the land owners must pay on the basis of the actual cost of constructing the Laguna dam which the government has fixed at $71 an acre.

Amendment to the Federal Constitution

ETERNAL vigilance is the price of liberty," good citizenship and practically everything desirable. California appreciates that fact as much as did those who landed at Plymouth Rock.

The California Cultivator has given much space to discussing one question, the proper settlement of which means a vast number of contented homes in one of the earth's most favored sections for the white race—or it may mean an even greater number of homes for an Asiatic race. But as much space as has been devoted to the discussion of alien land ownership, we feel justified in continuing this discussion, for, to the people of California there is just one side to this question, though, fortunately, we believe the nation as a whole, at least that part of it lying east of the Rockies, sees only another side. In other words, they are willing to sacrifice a vast number of their own people in order to maintain friendship with a nation across the Pacific.

While such ideas prevail agitation must be continued by Californians.

The Cultivator has just received this letter from a Los Angeles County subscriber:

"As a subscriber, I wish to say that I think you are performing a great public service, particularly to the agricultural interests, by your recent articles on the question of the 'peaceful invasion' of the Japanese. I trust that you will keep the good work up. You remember how Carthage was destroyed!

"I visited Honolulu at various intervals between 1899 and 1911 and saw its business and some residential parts change to a veritable Japanese city. It is said that they practically control the retail trade there now. And during several visits to Japan I have had ample opportunity to observe their teeming millions, their manner of living and their morals. We don't want them among us. Their hovels on the farm lands they are absorbing are a warning. I do hope the 'Cultivator' will keep a most vigilant eye on this most serious question of the Pacific Coast."

In writing, the subscriber encloses a leaf from the Congressional Record which gives the text of joint resolution providing an amendment to one section of Amendment XIV of the constitution. The resolution and the document embodying it are more or less technical but intensely interesting, so we quote largely:

* * *

Mr. Phelan: I introduce a joint resolution and ask that it may be read.

The joint resolution (S. J. Res. 144) proposing an amendment to the constitution of the United States was read the first time by its title and the second time at length, as follows:

Resolved by the senate and house of representatives of the United States of America in congress assembled (two-thirds of each house concurring therein), that the following amendment is hereby proposed to the several states as an amendment to the first section of Amendment XIV of the constitution, which shall become valid to all intents and purposes as a part of the constitution when ratified by the legislatures of three-fourths of the several states:

"Amendment XIV

"Section 1. All persons born in the United States and subject to the jurisdiction thereof whose parents are white persons, Africans, American Indians, or their descendants, and all persons naturalized in the United States and subject to the jurisdiction thereof, are citizens of the United States and of the state wherein they reside. No state shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any state deprive any person of life, liberty, or property without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws.

"The congress shall have power to enforce, by appropriate legislation, the provisions of this article."

Mr. Phelan: Mr. President, I simply desire to state in moving a reference of the joint resolution to the judiciary committee that at this time it seems appropriate and timely for the reason that the congress is engaged in the work of Americanization. This amendment on its face may seem extraordinary to many senators, because from the beginning of the republic children born upon the soil are ipso facto citizens. We have acquired the Hawaiian Islands, which are now known as the territory of Hawaii, an integral part of the United States, and there this condition exists: In less than 14 years the native born Japanese population will control the territorial legislature and all the elective offices. Therefore we will find the territory of Hawaii under alien control because these people are not assimilable, owe allegiance to their Mikado, and who, after and before the regular school hours, are now studying the Japanese language, traditions, and loyalty to the home government.

They seem to be unassimilable, un-American, and often anti-American, and hence those born upon our soil under this amendment, if it should prevail, would not be in power to control the territorial government of Hawaii.

At the present birth rate it is estimated that in 90 years there will be more Japanese in California than Americans.

Under the administration of Governor Johnson, in 1913, a land law was passed by which it was provided that persons ineligible to citizenship in California might not acquire agricultural lands. That law from which so much was expected is today absolutely a dead letter because those forbidden persons are putting the agricultural lands which they buy in the names of their native children who are citizens and enjoy all of the privileges, rights and immunities of American citizens.

Hence there is a necessity for changing our fundamental laws so that only the children of white persons, those of African descent and of American Indians and such others as the congress may naturalize, shall enjoy the priceless boon of American citizenship. We must not allow that boon to be used for the destruction of a state, either California, Oregon, or Washington, or the territory of Hawaii. I trust that the judiciary committee, to which I ask its reference, will favorably consider it.

Japanese-American Relations

Mr. Phelan: Mr. President, I ask to have printed in the Record a series of questions and answers on the subject of the American-Japanese relations.

There being no objection, the matter referred to was ordered to be printed in the Record, as follows:

* * *

The Japanese Times,
New York, N. Y., January 15, 1920.

Hon. James Duval Phelan,
United States Senate,
Washington, D. C.

Sir: It is reported by several newspapers to the effect that you are to introduce in American senate a bill which prohibits children born in this country of Japanese or Chinese parents from becoming citizens of United States of America, and, further, constitutional amendment to prevent Asiatic immigrations.

I will very much appreciate your kindness if you will answer following questions, as it will give us great help in securing a better understanding among our people:

(Following this introductory, the writer of the letter asked the questions which are quoted by Senator Phelan in his answer.—Edit.)

I will dispatch your answer briefly by cable, and full translation will follow by mail. Your frank advice and an earliest possible reply will be greatly appreciated.

Respectfully yours,
Y. Fuwa,
New York Correspondent to the Taisho Daily News, of Osaka, Japan,
Care the Japanese Times, 35 Sixth Avenue, New York City.

* * *

United States Senate,
January 17, 1920.

Mr. Yasuo Fuwa,
Care the Japanese Times,
35 Sixth Avenue, New York City.

Dear Sir: I am in receipt of your letter of January 15, submitting to me six questions to which you politely request an answer.

1. Question. Do you or do you not satisfy the recent announcement by Japanese government that the picture bride be prohibited strictly from February of this year?

Answer. I am well pleased with the decision of the Japanese government to refuse passports to "picture brides," but that is not sufficient to meet the objections of California. Other remedies must be found.

2. Question. How far, in your opinion, Californians will continue their anti-Japanese movement?

Answer. California desires very properly to preserve her white population, which is being driven off the soil by the influx of Japanese who have bought or leased land. The law forbids them to purchase land and still they are doing it by taking the land in the name of their children or in the names of corporations, both of which practices are clear evasions of the law. California will, I believe, continue to carry on this movement until the soil is in possesssion of the white race.

3. Question. Is Japanese people in California or elsewhere in United States destruct American living standards and their safety than those bolshevik, communist, or some other movement?

Answer. There is no comparison between the Japanese and the bolshevik movement. The Japanese dispossess the American people of the land and other means whereby to live, on account of destructive competition, while the Bolsheviks are corrupting their political opinions. The government has taken action against the criminal Bolsheviks and is deporting them from the country. It would be a solution of California's economic troubles if the Japanese there would return to Japan or concentrate in other countries.

4. Question. Do you favor that Japan to keep Shantung or Siberia or elsewhere in Asia in order to settle her immigration problem?

Answer. I am in favor of giving Japan an outlet in Asia for her surplus population in order to protect my own country.

5. Question. Will you state me what would be a best policy for Japan to keep her good relations with America?

Answer. Japan could best keep her good international relations with America by keeping her people out of America and encouraging those in this country to go to other lands. As long as they are concentrated on the Pacific Coast, the Japanese will be a source of irritation. The situation is acute in California, Washington and Oregon. Australia bas been able to protect itself. American public opinion has condemned Japan for her course toward both Korea and China, and good relations could also be improved by changing her policies in these respects.

6. Question. Do you believe war between Japan and America? If it is possible, will you state your reason?

Answer. America will never go to war with Japan or any other country unless under the greatest provocation, and I believe that no such provocation has arisen. All warfare is misunderstanding, and I trust your questions and my ans ers will serve a good purpose. If the Japanese would put themselves in our place, they would understand the situation. If Americans spread over Japan, and with improved and patented machinery cultivated the soil, and acquired it in large tracts, displacing the native population, what would Japan do? She would be obliged to stop it to preserve her people. Japanese travelers, students, scholars and diplomats will always be welcome in America, but not the inexhaustible supply of laborers who can not assimilate with the white race and who destroy the character of the population. Our government is a republic and has to preserve the standard of its population in order to exist.

Very truly yours,
James D. PLelan.

PEAR PRODUCTION

Bulletin No. 822 of the United States department of agriculture shows plainly the important place California holds in pear production in the United States. The average yearly production of the entire country is 11,425,000 bushels. Of this California produces 2,076,000 bushels. The only other state which reaches above the 1,000,000 mark is New York, with something less than a million and one-half. This bulletin quotes from tbe California state horticultural commission bulletin as to production in different counties. Sacramento easily leads in bearing age orchards with 3,000 acres. Lake, Placer, Santa Clara, Solano and Sonoma come next with from 1,000 to 1,500 acres. Los Angeles has only 311 acres credited as having reached bearing age, though we believe this must have been taken several years since, but is credited with having 2,388 non-bearing acres, while San Luis Obispo comes in with 3,285 non-bearing acres.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THREE MEALS A DAY

In discussing planks which may be used in building the platforms of political parties, an editorial in Collier's, written by Richard Washburn Child, touches upon agriculture as a fundamental well worth more attention than it is receiving from politicians. One of the first principles laid down in this article, or series of articles, is, "The most vital thing in our lives is three meals a day." As is true with humans, so with the nation; the most vital need is food supply. As essential to food supply, in addition to soil and proper condition, is the producer.

The position is then taken that food production in this country is jeopardized or that "there is a disease of the backbone of the country." But this disease, or the fact that there is any such disease, is not recognized by the politicians nor the people at large. This is shown by the fact that in a contest for prizes offered by a metropolitan daily for the best "plank" for a political platform there were 2,225 planks offered and practically none of these touched upon the necessity of giving attention to agriculture in any way. Things which were considered by these contestants were foreign relations, Americanization, labor and capital, social legislation, constitutional rights, Bolshevism, H. C. of L., free speech, taxation, Mexico, suffrage, tariff, railroads, league of peace, aid for soldiers, prohibition, negro problem, and many other topics too numerous to mention.

Meantime congress is cutting the appropriation heretofore made to the department of agriculture and the bureau of markets will be practically eliminated if present plans are carried out. The bureau of markets was greatly handicapped, almost eliminated, because of reduction in the recommended appropriation. The appropriation as now recommended will still further reduce the amount for the market bureau by $50,000. This means that the livestock reports which proved so wonderfully helpful to live stock breeders of the Pacific Coast during 1918 and up to July 1, 1919, will not be renewed. In addition, the reduction will curtail special fruit and truck crop reports so that they cannot begin to have the efficiency of those of last year. This may not prove suicidal to the country at large but it certainly will vastly reduce marketing efficiency. This will mean less prosperity for the farmer and will ultimately mean less food for the country. Possibly there may not be three full meals daily.

LAND HUNGER

Under the title of "The Leeches" the editorial referred to dealt with "Two Parasites on Agriculture." These are the parasite on the land and the parasite on distribution. The discussion of the land parasite we endorse in the main. However, there is one point to which we do take serious objection, and that is that, after discussing the activities of the "land hog" and the replies recently received by the post office department to a questionnaire which had been forwarded, in which wide discontent was shown by the farmers, reference is made to Governor Henry J. Allen of Kansas "who has done more than anyone to sound the warning and provide a remedy." And therein Collier's shows its inabiltiy to see farther west than the boundaries of Kansas.

All honor to Governor Allen. He sent to California and gathered in the best of information this state had in the matter of land settlement and taking the lands to the landless. Prof. Elwood Mead of the University of California, formerly at the head of land settlement in Australia, has put in operation in this state land settlement plans in advance of any state of the Union. Governor Allen used these plans in suggesting relief for his own state. Land tenancy in the Middle West is becoming a curse, and California's example is often quoted in the effort to provide something which will correct the evil conditions. The suggestions made by the governor of Kansas and quoted by Collier's may prove just as forceful as if full credit had been given, but naturally we of California wish credit for our own people who are capable leaders. If Collier's will be less provincial and subscribe for the California Cultivator, it may acquire a wide range of information as to two land settlement schemes, one already in operation, accommodating over 100 families, another, much larger, with assignments to be made within the next two weeks and already something like a dozen applications for each allotment.

The best of it is that the success of the Durham settlement is encouraging the people to demand more of the state land settlements. The enormous profits and overhead which must be placed on subdivisions of large holdings made through use of private capital make necessary a price which is a serious handicap on the producer. When the state takes charge an entirely disinterested superintendent may aid in directing selection of the parcel and aid greatly in securing for the settler expert advice and help.

A canvass of the farms of Kansas in 1880 showed that 84 per cent of the farms were owned by the operators and there were only 16 per cent of tenant farmers. In 1918 this proportion was changed to an even fifty-fifty. Fortunately, California is yet far from the fifty-fifty basis, and here's hoping Professor Elwood Mead's enthusiasm and ability for hard work will be sufficient to prevent it from ever reaching that proportion by giving us more opportunity for land settlement.

COOPERATE IN INSURANCE

Nearly 50 per cent of insurance cost is being saved California farmers by cooperation in insurance. Under our state laws county associations are allowed to insure in not only the county in which they are located but in each adjoining county. The law has thrown so many safeguards about these companies that while they have been somewhat restricted their security has been increased so that they are growing in strength and ability to serve. One of these, located in Los Angeles County, is now carrying about $12,000,000 in insurance. Excepting for one provision of the law, that which limits the total amount which may be carried by any one insurer to $4,500, this company would have been carrying a far greater amount. To meet this condition insurers who have become members have united and organized an entirely separate association. For a time its management will be from the same offices as the original company, and Mr. Cromer, who has for more than 20 years had to do with the managing of the original company, will give of his advice in the management of the new concern.

If a farmer can split his insurance costs in the middle and have equally as good, even better, security, why not?

MEAT WEEK

Through efforts of the livestock men the "Meat Week" campaign has been deferred seven days. It was discovered that the week chosen for Pacific Coast states, which was this, the last week of Lent, was not the best for the purpose as many church people would not observe the request made by the campaign directors. Hence the week beginning April 5 has been chosen.

As noted in a former Cultivator, the cattlemen are urging "Eat meat inteligently" as the slogan. They hope that consumers will not confuse the campaign by injecting the idea of greater economy in amount so much as economy in making wiser elections of meat. In the eyes of some porterhouse and loin chops are about the only meat cuts. The campaign is to educate up to the fact that equal nourishment and equal satisfaction may be had in the cut which costs much less money and which will lead to equalizing the demand.

EXPORTING LESS WHEAT

Report from the International Institute of Agriculture at Rome shows that the United States, with a larger crop of wheat in process of distribution, has shipped nearly a million tons less during the last six months than it did during the corresponding period of the preceding year. The great obstacle to greater export seems to be the exchange situation. The southern hemisphere is finishing its harvest and reports great increase in the production of cereals. Argentina, especially because of greatly increased acreage, has produced more than 200 per cent beyond its average production of the last five years.

CLAREMONT POMOLOGICAL CLUB

By V. V. Leroy

THE Claremont Pomological Club held its regular monthly meeting at the home f Mr. and Mrs. J. S. Jewell, Claremont, on Saturday, March 27. This club has maintained its enthusiastic interest in its work for over 21 years. Most of the best speakers of national importance on horticultural subjects have been secured to address its meetings. The attendance is always good and the discussions of value. The results show in the fact that its members produce far above the average amount of fruit. The social feature alone is of great importance in the rancher's life. At their noon hour, when a dinner is served by the host, the talks and discussion of varied subjects tend toward a splendid uplift in their lives, keep them out of the ruts, and broaden their outlook.

C. H. Vary, the head of the quarantine division of the state agricultural department in Southern California, made the first address. He gave a general outline of the needs of the quarantine service and of the every day work of the division, proving conclusively that the agricultural interests of the state are badly in need of the best efforts of these men and that they are being splendidly served.

Prof. R. S. Vaile of the citrus station at Riverside gave the first of a series of addresses on fertilizers. He spoke of the methods in the past of applying fertilizers on the surface of the soil as if we were growing annual crops, and of the recent attempt to get the food down to the feeding roots by the furrow application. While this is good he thought there ought to be a still better method devised. Plowing with a small scraper ahead of the plow share, to scrape the fertilizer which had been previously scattered broadcast into the furrow, before the plow turned the soil over, might be a better way. The putting of fertilizer down where the roots could get it and not leaving it in the few upper inches where a large part of it escaped into the air and was lost, seemed to be the important problem in fertilizing. Plowing, except for getting plant food deep into the soil, the speaker thought was poor practice.

Ernest Braunton, the well known writer on horticultural and floricultural subjects, next gave an intensely interesting address on the wild flowers of California. During the noon hour he gathered a large bouquet of flowers growing near with which he illustrated his talk. How he could remember so many jaw-breaking names was a wonder to his hearers. Mr. Braunton, however, made it clear by his illustrations that every name derived from Latin or Greek had a very special meaning in each case. The club expressed its hearty appreciation of Mr. Braunton's talk and its thanks to the Cultivator for loaning him to them for the day.

Dr. F. E. Garlough of the biological department of the United States government next gave a very instructive talk on the gopher. He said there are 30 varieties of this pest, but only two in this county. Drowning or gassing to destroy him were not very successful because of his habits. In a small way traps were by far the best, the wire trap being the surest and quickest. Poison was the only practical way, however, on a large scale. He demonstrated with an iron rod how to easily find the runway and drop a piece of poisoned sweet potato, carrot or parsnip down the hole made by the rod into the runway. Sheets with printed formula of the best way to make the poison material were passed around. The habits of the gopher were described. He is a very wise animal and you have to match his cunning or you will not catch him. He makes a runway as long as 60 feet and many laterals. When breeding the gopher digs down several feet and then makes two laterals where the nest is made in one and supplies kept in the other. Except at breeding time only one gopher occupies a runway. They breed only once a year generally and have from four to eight young in a litter. At night time they travel for quite a distance on top of the ground.

The next meeting will be held with Prof. and Mrs. Booth at Chaffey High School, Saturday, April 24, where two of the speakers will illustrate their topics with lantern slides.

Copyright 1920, by The Goodyear Tire & Rubber Co.

"The use of Goodyear Cord Tires on our hog ranch is a source of all-round farming economy as well as of simple hauling economy. These tires save time and the handling of supplies and animals while reducing wear on truck, minimizing operating cost, saving hog shrinkage and sickness in transit and demonstrating other important advantages."—N. T. Shearman, Owner, Shearman Hog Ranch, P. O. Box 452, El Paso, Texas

AS in the instance cited above, a large number of farmers, planters, dairymen, and ranchers are reducing much of their general farming work, in addition to their actual hauling work, with pneumatic truck tires.

By freeing farm trucks of the handicaps imposed by solid tires, Goodyear Cord Tires relieve farmers of the necessity of hauling slowly and laboriously either with teams or solid-tired trucks and thus hindering other activities.

The full traction, cushioning and nimbleness of Goodyear Cord Tires primarily equip a motor truck to go anywhere on and off a farm with utmost protection to mechanism, load, driver and plowed ground or paved road.

Thus these athletic pneumatics save time and labor in the handling of supplies, crops and stock, and in the operation of power-driven farm machinery, enabling easier feeding, watering, fencing, threshing, wood-cutting and the like.

The rugged strength of Goodyear Cord construction, affording the foundation of the whole success of pneumatic truck tires, results both from Goodyear pioneering work and that extraordinary care in manufacturing which protects our good name.

The detailed reports of many farmers using pneumatic truck tires to improve the work connected with diversified crops, or such specialties as fruit, livestock and dairy products, can be obtained by writing to The Goodyear Tire & Rubber Company, at Akron, Ohio.

GOODYEAR
CORD TIRES

AJAX CORD

WHEN you buy tires consider these two important points:

The integrity of the company whose name appears on the side wall.

The experience of motorists in your locality who use these tires.

In these major points, the Ajax Cord leaves no room for doubt. The Ajax name is paramount and Ajax users are Ajax enthusiasts.

Those cleats of the Ajax Cord take hold, like the cleats on an athlete's shoes. "Shoulders of Strength" brace the wearing surface.

Ajax Cord Tires, Ajax Road King Tires, and Ajax H. Q. (High Quality) Tire Accessories are sold at your nearest Ajax Sales and Service Depot.

PLANTING CITRUS TREES

(Continued from Page 567.)

packed in paper lined boxes in spaghnum moss. These boxes should hold from 75 to 150 trees.

We are now ready to plant. The first thing is to see that the water is ready and that you have a careful man to wet each tree. Drive down between the rows with one box of trees on a wagon or sled. In actual planting at least two men are necessary—one to hold the tree and spread the roots, and the other to shovel the earth. Place the yoke with the end notches against the stakes set. Now take one tree from the moss and wrap a wet burlap around the roots. This protects the roots from the sun and wind. The wind is more detrimental than the sun, as it dries faster. Take the tree to the hole, unwrap the burlap and place the tree at the center V notch with the bud union against the strongest wind and leaned slightly against the prevailing wind. The second man should now be ready with the moist earth. The tree should be planted at least three inches higher than it was in the nursery to allow for settling and to be sure that the bud union will eventually be high enough above ground. Often planters try to raise a tree after it has settled. This is apt to strip the roots, disturb the earth around the roots, and is a bad practice. The tree should be planted high enough in the first place. The earth should be shoveled in the center and roll down in the hole in the shape of a cone. This will materially assist the man holding the tree to place the roots in their natural position, properly spaced. If this is not done and the earth is built up in the shape of an inverted cone, then the lateral roots may double back on themselves in spite of the best efforts of the man holding the tree. Getting the roots properly spaced and in their natural position as they grew in the nursery is of the utmost importance. If the tap root is divided, or any roots hug each other, it is well to place a small piece of wood between these two roots to properly space them. By the time the wood rots the roots will have been trained to keep their proper distance. Do not shovel hot dirt against the bare roots to shock them. It is not necessary to tamp the earth in with the foot.

When the hole has been filled to the level of the ground, build up a basin about two feet in diameter around the tree, taking the earth from outside the basin. Be careful not to take the earth from the tree hole itself to make the basin. Now cut the water in, which has previously been started down the furrow. Let this water come right up against the tree. Of course this is not a good practice to follow after the tree is two years old and has its roots established and growing out from the tree, but when the tree is small and the roots are close to the tree, it is essential to get the water next to the tree to properly settle the earth around the roots, drive out air spaces, and thoroughly wet the roots. Water one foot from the tree may not soak in enough to accomplish your object and consequently the tree may get a severe shock and setback as a result of this lack of water applied at the very beginning of its existence in the grove.

After being assured that the tree will get plenty of water, go on to the next tree. Never take more than one tree at a time from the moss packed box and then only when ready to plant. Be sure to keep the tree protected from the sun and wind in carrying from the box to the hole. Water the second time either the same day or the next day. This method is more successful than running water in the hole as the earth is shoveled in. After the water has settled the earth around the tree, see that all roots are covered from the sun, as sometimes in settling the earth settles below the crown roots. Water the third time within a week or ten days and about two weeks later, and then every two weeks until the roots are established in their new environment. In heavy soil do not water after the second watering at such frequent intervals as to keep the ground and roots cold. They must be warm to grow.

I wish to add a few words of caution about the irrigation of trees during the first year. I find that the trees which respond best are those

Sulphur

It has been proven and so recommended by the Universlty of Californla that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste Sulphurs.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 110 to 220 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100% pure. This has increased various crops up to 500%.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 degree BE., etc., Fungicides and Insecticides.

Carried in stock and mixed to order.

SAN FRANCISCO SULPHUR COMPANY
624 California Street, San Francisco, Cal.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET"; also booklet "NEW USES FOR SULPHUR," Price-list and Samples.

Please state for what purpose you use the sulphur, quantity needed and date of shipment preferred.

311 California St., San Francisco.

A NAME and a BRAND to Trust

THE NAME of Goodrich, branded on automobile tires, is itself a certification of the very utmost in tire satisfaction.

Stamped upon millions of tires, it has stood and today stands responsible for their superior quality and service.

Goodrich keeps faith with every buyer of its tires. Frankly, openly, it states the least that a Goodrich Tire, with proper usage, will deliver.

6000 Miles for Fabric Tires, 8000 Miles for Silvertown Cords! It is an adjustment basis maintained only by virtue of persistent high quality reflected in the big mileage which the tires deliver.

Silvertown Cords, 8000 Miles

EVERY ORCHARD ITS OWN NURSERY

A fruit grower must now be as careful of his trees as is the nurseryman. There will be a great shortage of nursery stock of standard varieties; time alone will remedy this condition.

What the grower cannot attempt in propagating, grafting and budding, he can compensate for by persistent, intensive hoeing and cultivation and moderate irrigation, where available, to conserve every tree planted.

As fruit growers and nurserymen we strive for the improvement of horticulture in California. We are affiliated with the California Nurserymen's Bud Selection Association, an organization of the best expert talent devoted to the improvement of the standard fruit varieties by the exercise of the principle of selection and elimination. To this end also we strive mightily to deliver to the California fruit growers the best trees that can be grown.

The shortage of fruit tree stock of the best standard varieties for the season of January and February, 1921, will be greater than this year and for every one tree then available there will be two wanted. The planter who buys now not only saves money in the buying but assures the carrying out of his planting plans.

Every dollar invested in fruit tree planting will bring you more income than any other enterprise. Write us today concerning your next season's wants.

J. E. Bergtholdt

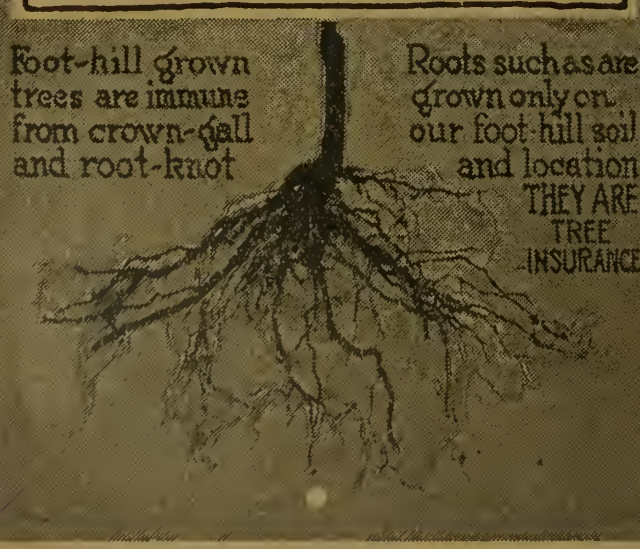
Nurserymen and Fruitgrowers
Newcastle, Cal.



Foot-hill grown trees are immune from crown-gall and root-knot
Roots such as are grown only on our foot-hill soil and location
THEY ARE TREE INSURANCE

which during the entire first summer have been given water close to the tree and settled slowly. Too often water is cut around the trees and allowed to run swiftly. In some soils there is danger of slicking the surface of the furrow when the water is started too fast. If this happens, comparatively little water soaks into the ground around the roots. It is a good plan after irrigating to examine your soil around a few trees by digging and see by actual observation whether or not you have made the thorough job you intended. I add this word of caution because I have sometimes seen trees with dry roots directly after irrigating, and the most surprised man was the man who irrigated.

The trunks of the trees should now be protected from the sun's rays. Either newspaper, burlap, yucca, or perforated oiled paper wrappers can be used. If newspapers are used they should be wrapped loosely and you must be sure to cut off the strings before they cut into the bark of the growing tree. Too often this is neglected by well intentioned men. I believe that ultimately the most economical wrapper is the yucca or perforated oil paper wrapper. Be sure, whatever wrapper you use, to extend it into the ground. The greatest reflection of heat and consequently the greatest danger is near the ground.

For some years I did not believe that it was necessary to fertilize a tree the first year. About two years ago, with the cooperation of some of our planters, we began experiments in different localities and the results were astonishing. Shortly after planting we asked these growers to basin and put cow manure in the basin on a few trees or rows of trees. At each irrigation the water filled the basin, soaking the manure, and carried nourishment to the roots. The trees thus fertilized showed almost double the growth at the end of the summer. I am not sure that this is the best method of fertilizing to follow, but I do believe that the trees will come into bearing much quicker if fertilized properly from the very start.

In conclusion, we advise the sighting in of trees when planting; the digging of a large hole; nursery stock from a light, loose soil; loose rooted trees; careful high setting and thorough irrigation; protection from the sun, and fertilization to start the first year.

Flood Control

By Ernest Braunton

THE matter of flood control is for the first time engaging the attention of all parts of the sttae, though the annual toll of damage from erosion seems to be heaviest in the south end of the state. The shifting of channels and washing away of land is most serious where soils are of a light and sandy nature.

Various methods of checking floods are being given tryouts, but the practical end of the work at present really lies in protection of the lands below where check dams are possible. To cite an example, many of these dams were built in the San Dimas Canyon, a few miles east of Los Angeles. While these tended to check the flow and protect the canyon proper, they did not in any way arrest the water or check its momentum a mile below the canyon mouth where the orchards and farm lands begin. Therefore protective measures for these lands are the most important consideration engaging the attention of county officials.

San Dimas Wash Flood Control
A stretch of brush fences that control five miles of the flood waters from San Dimas Canyon as they pass through Covina, Los Angeles County.

Storm Water Guides

As the waters cannot be curbed, the problem resolves itself into steering the runaway so little or no damage results. Some of this work has in the past proved very costly, especially where concrete or rock work has been built. It was soon found that mere weight counted for little unless it could be protected from undermining. The most economic plan, already adopted at many points, and in use for five miles along the San Dimas wash, is the brush fence method. Second hand or used pipes of two inches or more diameter are driven in the ground for eight or ten feet, sticking a' ove four or five feet.

Two rows of these are driven four feet from each other and ten or more feet apart in the row. On each row of posts is fastened a sheet of strong wire of six inch mesh extending a foot below the surface and bent out at bottom six inches toward stream bed. This "flange" at bottom prevents serious undercutting in case the soil is washed away. Into this continuous four foot bin is laid brush trodden down solid. Prunings from orchard and garden, loads of old geranium stalks, were noted in the San Dimas containers. This scheme has worked wonders in guiding flood waters and protecting orchards and farm lands. It is the most inexpensive, too, of all methods tested.

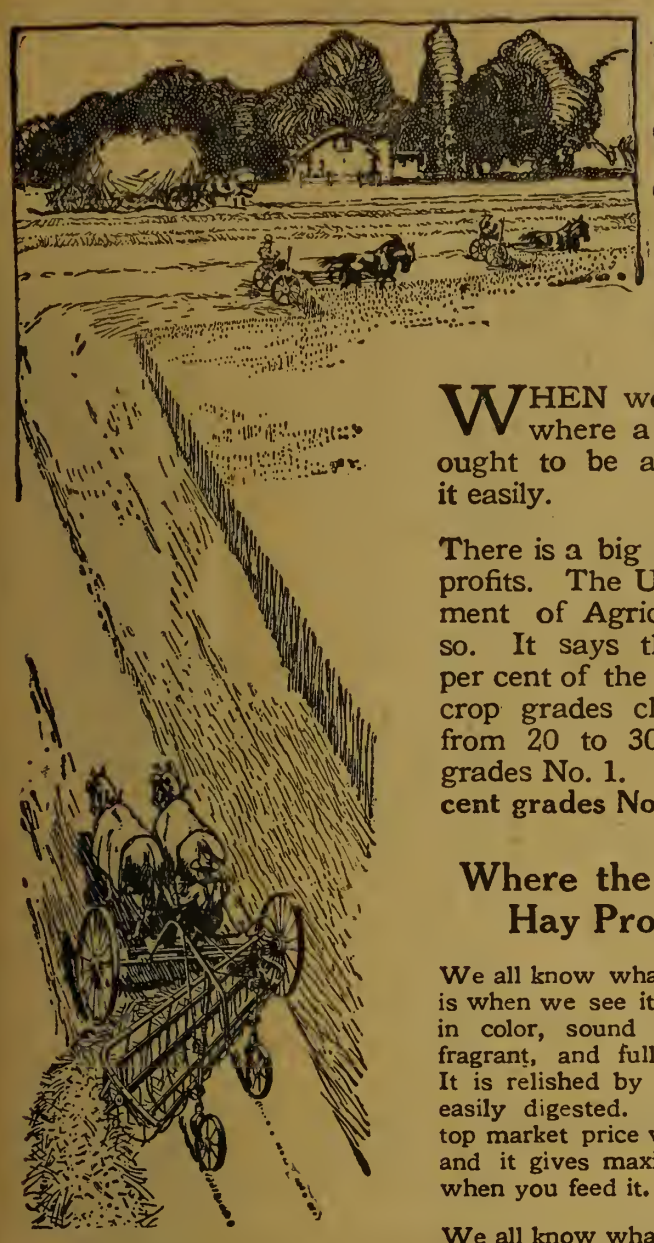
The change has been severe, however, on those living below this five mile long channel. Its extension to the Irvindale Avenue section is sorely needed. To remove the necessity for such construction plans are now complete for a dam in the San Dimas Canyon having a depth of 125 feet. This will catch and hold the excess storm waters, which may then be gradually released between floods so that no harm can result to lands below lying along or nearby this great wash. This appears to be the scheme that must be followed with all canyons whose waters work destruction to agricultural pursuits. On the outside of the protective fences the county forester has planted from three to many rows of black locust, which, when grown, will prove a considerable aid in guiding the waters aright, as well as beautifying the landscape.

IN NO HURRY

"All the little boys and girls who wish to go to heaven," said a Sunday school superintendent, "will please rise." Whereupon all, with the exception of Sammy Scruggs, rose. "And doesn't this little boy want to go to heaven?" asked the superintendent, in surprise. "Not yet," said Sammy.

WHAT'S THE DIFFERENCE

When a boy grabs all the cake, he is called a pig; but when he grows up and grabs all the money, he is called a leading citizen.



Hay harvested by the Dain System means more dollars in profit whether you market your hay or feed it. The Dain System Rake enables you to use this system.

Stop the Leak in Your Hay Profits

WHEN we know just where a leak is, we ought to be able to stop it easily.

There is a big leak in hay profits. The U. S. Department of Agriculture says so. It says that only 10 per cent of the annual hay crop grades choice. Only from 20 to 30 per cent grades No. 1. **And 60 per cent grades No. 3.**

Where the Leak in Hay Profits Is

We all know what "choice" hay is when we see it. It is bright in color, sound as to foliage, fragrant, and full of nutrients. It is relished by live-stock and easily digested. It brings the top market price when you sell, and it gives maximum returns when you feed it.

We all know what No. 3 hay is when we see it. It is "off color." It has lost much of its foliage. It is tasteless. Stock will not eat it readily. And it carries but little nutrition, in proportion to its non-digestible fiber. It is all right for stall litter, but it is very unsatisfactory for feeding or selling. Its market price is about $10 a ton less than that of choice hay.

The big difference between choice hay and No. 3 hay is mainly a matter of curing. The leak in hay profits is in incorrect curing methods.

Curing in the Swath is Costly

Letting the hay lie in swaths to cure under a hot sun is the method that frequently causes the big loss. And here is the reason:

You have noted that hay, when cut by the mower, falls back in a position similar to shingles on a roof, with the heads and leaves exposed to the sunshine and the stems underneath in the shade.

TWO hours of hot sunshine sears the exposed leaves and stops the process of draining water from the plant. The pores in the leaves are closed and the water is sealed up inside the stems. The sun continues to shine on the heads and leaves until the water is slowly steamed out through the stems. The leaves are sunburned long before this unnatural process has continued until the hay will go into stack or mow without spoiling. They will crumble between your finger and thumb. Many of the leaves fall off in the process of raking and stacking or loading and storing. The hay does not have the color, the fragrance, the palatability, the digestive qualities nor the nutrition of the "choice" or the No. 1 grades cured in the proper way.

Use of the Dain System Stops the Leak

By doing away with the old-style method of swath-curing, and using the Dain System of Air-curing Hay, many hay growers have stopped the leak in their hay profits. They are making "choice" or "No. 1" hay instead of the lower, unprofitable grade that they used to make.

The Dain System is called "Nature's Way of Curing Hay." It puts into practice the principle that properly curing hay is merely taking the water out of the hay rapidly and efficiently while keeping the nutrients in, and that the best way to accomplish this is to let the water pass out of the plant in the natural way.

Water leaving a plant in the natural way passes out through the leaves in the form of perspiration. Examine a blade of green hay under a microscope, and you will see little drops of water oozing out all the time. How rapid and thorough this natural process is can be best understood when one remembers that from 200 to 400 tons of water per acre are utilized in maturing a hay crop.

THE Dain System Rake was built for the special purpose of handling hay while it is still green. Using this rake, you follow the mower before the sun has had the opportunity to sear the leaves. The rake picks the hay up while the leaves are still active and delivers it on clean stubble in a medium-sized, loose windrow.

The action of the rake places the bulk of the leaves on the shady inside, and the stems on the sunny outside of the windrows. The windrows, being loose, air passes through freely. The leaves continue to function normally in draining water rapidly from the plant. More quickly and with less labor than in swath curing, the hay is ready for the stack or mow. And only by this method of curing can hay be given the feeding qualities that bring you the greatest returns when you feed it or when you sell it.

Find Out all About the Dain System

Don't fail to find out about the Dain System and the Dain System Rake before your next haying season begins. Make it the means of stopping the leak in your haying profit.

Ask your John Deere dealer to show you this rake. He will show you how easily it works—how its operation makes the Dain System of air-curing hay the simplest, as well as the most profitable method that you can use.

Note the inclined frame that distinguishes the Dain from other rakes of its type. You will find that this inclined frame is as important as a properly-shaped moldboard on a plow. The frame is low at the front end and increases in height toward the rear—its capacity increases as the volume of hay increases. The low front end is set slightly ahead of the tooth bars, causing the hay to come up against the frame and pitch forward in the loose coil that characterizes the Dain way—the way that puts the leaves inside, the stems outside, and allows plenty of air to pass through the windrow.

WRITE TODAY FOR A FREE BOOKLET. We have prepared a booklet that explains the Dain System thoroughly. Many thousands of copies of this booklet have been distributed. You will find it interesting and profitable reading. Send for your free copy today. Address John Deere, Moline, Illinois. Ask for booklet DS-17.

THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

Wonderful New Hay Crop
SUDAN GRASS

First Introduced into the U. S. in 1909 from the Sudan in Africa. Tests by the department of agriculture have proved it to be of the greatest value in the Southern and Western states, where rainfall is deficient.

Culture—Sudan Grass is strictly an annual. It may be drilled or broadcasted. If drilled 8 to 12 lbs. per acre is ample; for broadcasting 15 to 25 lbs. should be used. It grows 8 to 10 feet high and yields from 3 to 8 tons per acre. You are sure of two cuttings, and if irrigated three or four cuttings.

Sudan Grass for Pasture—During the months of August, September and October all other grasses are dry, then is the time Sudan is most valuable for fall pasture, and by having it fenced in small fields it will yield food for six times as much stock as any other forage will without irrigation. For milk cows and hogs, there is no better and more abundant pasture than Sudan Grass. It will solve the hay proposition as nothing else can or will do in this climate. A good silage and balanced ration. This seed was grown on our own farm, and is free from Johnson Grass.

Price Per Pound:

10 lb. lots, 25c — 100 lb. lots, 20c
250 lb. lots, 19c — 500 lb. lots, 18c
1000 lb. lots, 17c

This Month in the Ornamental Garden

Northern California

By A. R. Gould

THE greater part of garden preparation should be completed this month and most of the empty spaces be ready to fill up with that charming annual or perennial flower so that it will have a good start. Many beautiful subjects may be sown where they are to flower and will provide a nice splash of color in the beds or border. Among the quick flowering annuals we suggest sowing Godetia, Double Rose; Clarkia, Salmon Queen; centaurea Cyanus, or blue cornflower; calendula, orange and yellow; calliopsis, Crimson King dwarf; Browallia speciosa, blue; candytuft, giant hyacinth flowered, white and rose cardinal; dimorphotheca, orange daisy; gypsophila, white; linaria hybrids; Linum, red; mignonette Shirley and tulip flowered poppies. These will supply you with cut flowers most of the season. The seed should be thinly sown and the seedlings later thinned out for future development.

Planting of trees and shrubs will be completed also this month, as it is hardly practical to handle plants from the field much later. There are, however, some nurserymen who grow much of their small stock in pots, hence these are supplied for planting almost any time. All the vacancies in the rose garden should be filled without delay and the beds should be well trenched with manure if you are after choice blooms. Dusting with dry sulphur or spraying with liquid spray will be necessary, and for that frequent visitor, "Mr. Aphis," attack with "Black Leaf 40."

Gladiolus

Of late years these flowers have become deservedly popular and through the efforts of hybridists and observant growers who have specialized in this flower there are numerous varieties ranging in many delicate shades. In our own state the gladiolus sets seed quite freely, so that each year any grower, providing he have the best parent stock, may raise new varieties and most probably secure something worth while. Bulbs of these flowers may be planted this month in fairly rich garden soil, six inches apart, and if a solid color scheme is aimed at, plant one good variety such as Mrs. Francis King. If they are desired for a successional display, a number of the following varieties may be grown: Dawn, Augusta, America, Princeps, Brenchleyensis, Peace, Loveliness, Halley, Klondyke, Snow King, War, Baron Hulot, Panama and Primulinus hybrids.

Dahlias

Interest increases also in this flower and like the gladiolus it is easily raised from seed which the plant produces freely enough in our climate, and it is quite possible to raise it from seed to flower the same year, or cuttings of desirable types may be placed in sand and will root readily. Strong tubers having several eyes may be secured and planted during the month, spacing them at least three feet apart. There are now in cultivation an endless number of varieties, and they are divided into several groups such as paeony flowered, cactus, show and fancy, pompom, collarette and single. and they range in size from the button type to that of the large dinner plate. However, for strictly decorative purposes the cactus singles or collarettes are the most useful. Any good seedsman's catalogue will describe the many varieties and a pleasing selection may be made, or seed may be sown in boxes of fine soil and some real surprises secured, which creates an added interest to home gardening. Sow now and watch developments. Plant out seedlings when three to four inches high in fairly rich soil and when in flower select the best for your collection.

Chrysanthemums

This beautiful fall flower should be secured and planted this month. Your nurseryman will supply you with strong plants of the single and bush flowering types for garden planting, or if the large flowered varieties are desired a special frame covered section must be prepared for them. We shall deal more fully in later monthly notes with cultural directions. In the meantime prepare the soil with manure and thorough cultivation.

Lilliums

There are quite a number of fine types of this bulbous plant which should be grown in every garden. They require rich soil to thrive, and to be effective should be planted in groups. The best are L. Auratum, L speciosum rubrum, L. tigrinum, L. Henryii, and the most recently introduced L. regale, discovered in China by that most famous plant collector, E. H. Wilson.

Carnations

The following will provide a long display and plants may be set this month: Enchantress, Matchless Benora, Yellow Prince and Belle Washburn. Plant those in rich soil about six or eight inches apart

Complete-ness

YOUR tractor should be a *complete* power investment. It should be one that can be used practically every day of the year, one that is 100% efficient, belt and drawbar.

The **International 8-16 kerosene tractor** meets those requirements. The drawbar has a wide range of adjustment both up and down and sidewise so that the tractor will pull any machine or implement on the farm with equal advantage. The 8-16 pulley is so placed that the tractor can be backed into the belt quickly—so placed also that the belt doesn't rub against any part of the tractor nor drag on the ground. And 8-16 power is just right—neither too heavy nor too light—it *fits* practically any drawbar or belt power task on the average farm.

Aside from its adaptability for all-year-round farm work, the **International 8-16 tractor** is a 100-cents-on-the-dollar investment because of its exceptionally efficient and economical (kerosene) operation; because, too, you can always secure repair and expert service without delay through the 92 branch houses and many thousands of dealers. Your International dealer—wherever he is—has a Harvester branch in easy reach.

If you are interested in a *complete* tractor power investment just write your name and address along the margin of this advertisement and mail to the address below so that we can send you full descriptive information of the **International 8-16.**

The MOLINE Tractor is Universal

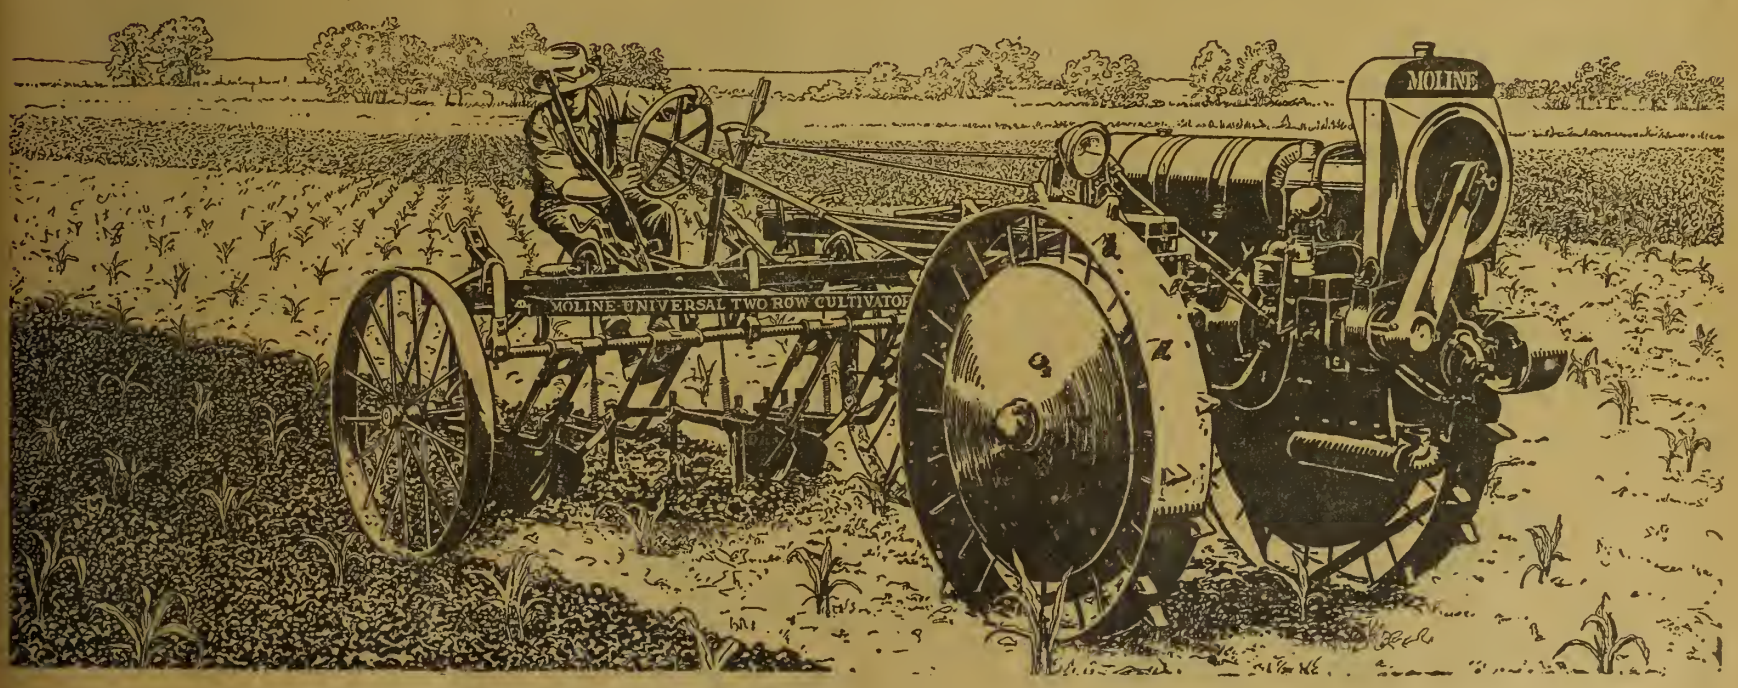
6 Indispensable Results

The principle of doing all field operations with one man sitting where he can watch his work is correct, or farming has always been done backward, and the operator would always have ridden or led his horses instead of driving them.

The Moline Universal Tractor places the power of nine big horses where the horses stood—is driven just like horses are driven, from the seat of the implement, and hitched up to the implements just as horses are hitched.

No duplication by horses	*Because*	Does all field work, including cultivating, harvesting and belt work
A large saving in labor	*Because*	One man completely operates both tractor and all implements
Great ease of operation	*Because*	A single seat in the center of all controls of tractor and implement
Can back and turn short	*Because*	A single unit of operation—the tractor and implements form but one unit
Better and faster work	*Because*	Operator sees all his work—"Foresight is better than hind sight"
Power used as horses are used	*Because*	Tractive power in front of the work with operator behind the work

Utility Is Not Sacrificed for Price



If desired you can use the "drag behind" or horse drawn implements you now have with the Moline Universal Tractor, the same as with other types of tractors.

See your Moline Dealer or write our nearest branch for full information.

Southern California

By Ernest Braunton

SO sufficient and satisfying have been the late spring rains that gardening operations have received a welcome extension. Without artificial aid garden plants are in luxuriant growth. This succulent vegetation demands much water and when the warm days come there will be much "flagging" or light wilting. This shows need of water and the need must be met. Aside from soil moisture an early morning light spray, before the sunshine is strong, is a splendid stimulant to prepare foliage for a hot day's activity.

April is the first month for tropical planting and the last for planting of things in general, excepting a few bulbs. Tropical plants from elephants ears to oranges may be planted now or in May. It is early enough for plants of this class and the close observer will note about July that tender subjects put out in February and April are of like size and vigor and in the same stage of development. The growth of tropical plants is not aided by early planting. With all seed beds care should be taken to see that a soil crust is not formed that prevents seedlings from being projected into the free air. After sowing if a little sand or finely sifted manure, or both, may be lightly raked into the surface, the latter will not become encrusted.

A Busy Time

Insect pests and plant diseases propagate apace these days, so that sprays are more profitable in application now than later. Free your plants of these so they may start seasonal growth without handicap. Thin sown seed beds so every plant will have a fighting chance without too great competition. The list of seeds for sowing now, both annual and perennial, is a long one, and it is fairly safe to sow anything and everything. Haste should be made to divide all perennial roots for they are ready to grow now. Those tropical clumps of cyperus, elephant's ear and papyrus can be divided and so multiplied, and this is as true of that group to which bananas and cannas belong.

Some bulbs may still be planted—the last lot of gladiolus, amaryllis, dahlias and tuberoses. But it is an ideal time, and early enough, to plant tuberous rooted begonias in a shaded or half shaded spot. Soil for these must be loose and rich. Hard, sterile soils or hungry sandy soils will not do. Leaf mold with some well decayed stable manure and superb drainage is the proper combination for these aristocratic bulbs. Bedding and border plants of all sorts should be put out at once; it is the season for finishing your garden as you expect it to remain for the summer. The young lawn grass needs much and frequent waterings in these days of tender growth. Water all plants in early morning, not during the hottest hours.

A Great Squirrel Drive

On Thursday, March 25, Horticultural Commissioner Ryan of Los Angeles County sent out a truckload of squirrel poison containing 10,500 pounds, for distribution and use in the second annual squirrel control drive in the Antelope Valley. And this is but a part of the poison to be used. The United States biological survey, represented by F. E. Garlough, will furnish 2,500 pounds for government lands, the California state department of agriculture will furnish the amount necessary for state lands in the district, the Tejon ranch will have a ton and the Southern Pacific will cover its right of way.

The field application of all this poison was made on March 31 and April 1-2-3, covering fully 200,000 acres and requiring the time and labor of at least 200 persons. The work has been systematized and the territory divided into six districts—Del Sur, City Ranch, Elizabeth Lake, Fairmont, Neenach and Bailey's Lake. The county work is in charge of L. S. Neville, the state work, of W. C. Jacobsen. Last year the drive netted 90 per cent of the squirrels in this district, but the pesky ten per cent remaining has now increased to about 25 per cent of the original number. The present drive is expected to result in total extermination, for the territory will be carefully canvassed after the drive and all open holes again dosed so that the squirrel will indeed be sly that evades the final summons. As the present is the most favorable time for poisoning squirrels all with infested lands are urged to attack this pest by either the bisulphide of carbon method, given in Cultivator of January 17, 1920, or with the poison recommended by the United States biological survey, and given in former Cultivators but here repeated:

Poison and Its Use

Barley, recleaned grain, 16 quarts; strychnin (powdered alkaloid), 1 ounce; bicarbonate of soda (baking soda), 1 ounce; saccharin, 1-10 ounce; heavy corn syrup, ¼ pint; thin starch paste, ¾ pint; glycerin, 1 tablespoonful.

In a clean vessel mix thoroughly one ounce of powdered strychnin (alkaloid), one ounce of common baking soda, and one-tenth ounce of saccharin. Crush all lumps of the soda with mixing spoon. To this add one-quarter pint of heavy corn syrup and stir thoroughly to a smooth, creamy paste free from lumps. Over this pour three-quarter pint of thin hot starch paste and stir well. (The starch paste is made by dissolving one heaping tablespoonful of dry gloss starch in a little cold water which is then added to three-quarter pint of boiling water. Boil and stir constantly until a clear thin paste is formed). Add the tablespoonful of glycerin and stir thoroughly, making sure that none of the heavy syrup paste still sticks to the bottom of the container. Pour this mixture over 16 quarts of good cleaned barley and mix well so that each grain is coated.

For mixing small quantities an ordinary galvanized wash tub is convenient. For larger quantities a tight smooth box may be used, and the mixing may be done with a spade. Each quart of the poisoned grain is sufficient for 40 to 50 baits. This quantity scattered along squirrel trails, or on clean, hard places on the surface about the holes, will not endanger stock.

N. B.—Strychnin in any form other than the powdered strychnin alkaloid is not effective in the above formula.

TRACTORS must work on an average of 210 days per year on the large ranches of the West—which means anywhere from 2100 to 5000 hours service per year.

BEST TRACTORS have mastered these conditions for over thirty years. BEST engineers have gradually made improvements until today the BEST TRACKLAYER SIXTY stands supreme as the most dependable heavy duty tractor built.

The tractor built in the West to meet Western conditions in farming, road building, logging, hauling and belt work.

Best "60" Tracklayer and road scraper. Taken at Denver, Colorado, June 1919. Lower photo shows Best "60" pulling 9 plows 8 inches deep in hard adobe land

BEST TRACKLAYER TRACTORS

Write for name of your dealer

A few outstanding features of the SIXTY are: Ease of operation—accessibility—no wheel, all track—no belts or chains, all gear driven—turns in own length—37 anti-friction bearings—manganese steel tracks—working parts completely housed—non-lubricated rocker joint in track, etc.

GMC

General Motors Trucks

The Trucks That Get There and Back

Getting your product where you want it and getting back again are the main things so far as a truck is concerned.

A good deal may be said about the machinery of a truck, but what you want after all is to get there and back.

GMC Trucks do that very thing in a way that makes long explanations unnecessary. In other words GMC Trucks are noted for keeping out of the repair shop.

Aside from hauling livestock, produce or grain to market, there is plenty of work for a truck to make it pay on the average farm.

But above all, a truck that can be depended on is most important.

GMC Trucks are built by the exclusive truck making unit of the General Motors Corporation.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Blackeye Beans

What is the best time to plant blackeye beans (or peas)? How many pounds of seed is required per acre, and from good soil how much may one expect for a crop? Is there more than one variety of blackeyes? —J. H. J., Lemoore.

The best time for planting is the first half of April; in your heavy soil, about 15th. About 30 pounds to the acre is usually planted. They are heavy producers, 2,500 pounds an acre being grown without irrigation, though better crops will result from application of water. So far as we know but one variety passes under the name of blackeye.

Feeding Dahlia Bulbs

We have a quantity of common dahlia tubers. Will it do to feed them to pigs, horses, or other stock?—Subscriber, Burbank.

Dahlia bulbs have been boiled and fed to human beings, as a joke, in several instances known to the writer. As they belong to the sunflower or composite family, they are closely related to the Jerusalem artichoke so commonly used as a food for hogs and we see no reason why the dahlia tubers should not be of equal value. They are much alike, both raw and cooked, in flavor and in general appearance and consistency of flesh.

Time to Pick Lemons

Should lemons be picked when they are turning yellow or left on trees until they become quite yellow? What is the best way to preserve them?—Subscriber, Santa Maria.

Lemons are picked when they reach the proper size; the quality is lowered if they are permitted to turn yellow on the tree. Sometimes in winter the yellowing cannot be prevented, but in growing season if the trees are thrifty the fruit should be brought up to commercial size. If 360 size is desired, cut when the lemons are 2 1/4 to 2 3/8 inches in diameter. If they are a rich dark green they will cure under proper atmospheric conditions down to perfect lemons.

Starting Sweet Potatoes

How are sweet potatoes started?—Subscriber, Santa Maria.

This question was so well answered by Q. A. Lobingier in the Cultivator of January 29, 1914, that we repeat:

"For growing sweet potato plants select some well sheltered spot that will get the sun most of the day. Often such a spot can be found on the south side of some building. Spade up the soil eight or ten inches deep, making it as fine and mellow as possible and rake it level. About the first of April select medium sized sweet potatoes and place them upon this bed of soil quite close together, allowing about half an inch space between the tubers. If some of the tubers are quite large cut them in two lengthwise and lay them with the flat side down. If the bed has been made alongside a building, do not make it more than four feet wide, as it will be hard to reach the young sets later on. I have overcome this objection by setting up two boards parallel with the building, allowing the board next the building to be 18 inches or two feet away, so that one can get between it and the building. These boards need be only about eight inches wide, and no matter if the bed is eight or ten feet wide, you can lay a heavy board across the bed upon which to stand when getting your sets. After your tubers have all been placed cover them with clean fine sand to the depth of about one and one-half to two inches and give them a thorough watering with the sprinkler. Do not water too freely after this first time until the sets begin to show up through the sand, but on the other hand examine the soil every day to see that it does not dry out. After the sets begin to grow the bed can be watered more freely. Some growers plant the sets out in the field as soon as they are large enough, while others go over the bed from time to time and break off the sets from the potato, allowing the potato to remain in the bed, and transplant the sets very close together in rows."

Trench Silo

With the price of feeds going up I find it necessary to use silage and wish to save the present crop of mell-

lotus. Will it be practicable to dig a trench about three feet wide and five feet deep, as long as necessary, board the sides and affix to them cheap roofing paper and fill up with chopped clover with a sprinkling of barley, oats and alfilaria, and keep on packing it down and when full, cover up with one inch boards and paper roofing and keep the silage good? Around the sides I would put water with a view of keeping the ground around well packed and tight. When taking the silage I would start by taking only the small surface my goats can consume every day, and go to the bottom, and after that either repeat or else take perpendicularly a slice every day, if the proportion to use is suitable.—Subscriber, Yucalpa.

We have never heard of silo being constructed in the exact form you describe, but we are inclined to think it is practical. Unless you have a very large herd of goats, even if you could build a very small silo, it is possible you could not feed down fast enough to prevent spoilage. If your trench is only five feet deep we think you would have to use greatest care to tramp very firmly. Care must also be taken, as you suggest, in keeping air from working in at sides. Even with the utmost care, if the soil should be gravelly or stony its loose nature might permit air to enter and spoil some of the silage. On the other hand, if soil is very heavy, especially as to subsoil, the drainage might be poor and water might stand in the trench and prevent proper bacterial action, which would mean poorly cured silage. Silage has been kept in this way, or, rather, in the larger trenches made by scraping out by the use of horse power. Will be glad, indeed, to learn as to your success if you make a trial of this method. Above all, be careful and pack down very firmly. We think the feed would be exceptionally fine for the goats, but as a rule has not been found acceptable to hogs or chickens.

Argentine Ants

Please tell me what to use to keep Argentine ants away from orange trees.—Subscriber, Colton.

The sticky barriers or smears which trap and destroy the pest are usually not so successful as the poisons, or one poison which was given by Mr. Woglum in the California Cultivator of March 30, 1918. This consisted of 12 pounds granulated sugar, 7 pints water, ¼ ounce tartaric acid (crystallized). Boil 30 minutes. Allow to cool. Add water equal to that evaporated. Three-quarters ounce sodium arsenate (chemically pure only), dissolve in 1 pint hot water. Cool. Add poison solution to syrup and stir well. Add to the poisoned syrup 2 pounds honey. Mix thoroughly. This mixture is placed in can or small container with sponge and the sponge is soon covered with ants carrying away the poison. Where one wishes the tree barrier it may be had by mixing 1 pound resin and 1 gallon castor oil, using gentle heat to make into one mass. If too thick add more castor oil. This mixture may be applied on the bark of the tree, or better, a piece of old soft rope like baling rope may be saturated and tied around the trunk of the tree. This will remain sticky about ten days.

Sugar Prunes and Grapes

Last spring (1919) I planted four sugar plums which grew so high, some of the shoots being eight feet, that a neighboring fruit grower was asked about them and advised heavy cutting back. This I did with two of them and they are now in full bloom, while the others are not. What shall I do with them? I also have a freak grape vine. Some years ago I grafted a Black Prince on a Tokay root and now have a vine bearing two kinds of grapes; one is a large white grape of good value and the other is a Black Prince. Can you tell me cause of freak?—Subscriber, Lodi.

The two trees cut back were given correct treatment. For the first few years they need heading much more severely than the French prunes. Treat the other two likewise and thin properly each year. In regard to your Black Prince (Rose of Peru) grape, we are at a loss for solution, but believe a shoot of Tokay must also have grown up; in some cases they do not color and you have a "white" Tokay. If not, the Tokay may first have been grafted on the root of a white grape.

Buttermilk for Feed

What is the value of buttermilk for feeding, that is, buttermilk with the water removed? Kindly state your opinion as to its value for growing stock and fattening, and if it is a good mixture with grain.—Subscriber.

Dried buttermilk has a similar feeding value as the solids in the buttermilk before drying. Since this contains on the average about 9.5 per cent solids, it follows that dried buttermilk is worth about ten times as much as ordinary buttermilk for stock feeding. In order to place a money value on it, it may be assumed that it takes on the average six pounds of buttermilk to equal a pound of grain in feeding value. With barley at $3.50 a hundred, buttermilk will therefore be worth about 60 cents a hundred, and dried buttermilk $6 a hundred, or $120 a ton. There are several brands of condensed buttermilk on the market that have been only partially desiccated and contain over 60 per cent of water (40 per cent solids). These should only be bought on definite guarantees of water content and freedom from sulphuric acid. It is likely that they will be found expensive feeds in comparison with either grain or tankage. Dried or partially dried buttermilk is sold under

Big Money Boring Wells

Have water on your own farm. In spare time make wells for your neighbors. It means $1000 extra in ordinary years, double that in dry years. No risk—no experience needed.

ESSEX MOTORS DETROIT, U.S.A.

Essex Almost Doubles Light Car Endurance

Essex Has Performance Like the Costliest Fine Cars— Its world Endurance Record Has Never Been Rivaled

The most important thing Essex has proved is that weight and size are no longer necessary to finest car quality.

Its 3037 miles in 50 hours is a world endurance record. The test was official. Supervisors of the A. A. A. certified the Essex stock chassis in every detail.

Never before was a car driven at top speed for 50 hours. The grind was equal to years of road use. Yet the Essex showed no measurable wear.

What car, the Essex size and weight, can even attain a mile-a-minute speed, much less keep it up for 50 hours?

Such Endurance as You Want in Your Car

These decisive tests proved Essex not only the supreme performer of the light car field, but they showed that the moderate priced, economical Essex has such endurance and dependability as few large, high priced cars offer.

Greater size could add nothing to Essex. It has the qualities weight and size are built to give—riding comfort, solidness, distinction and smooth, quiet pace. But in addition it has fuel, oil and tire economy. And its great durability means freedom from repair costs and positive, dependable transportation.

Essex is easy to operate. Driving does not fatigue. Its quick response to the lightest touch and its smooth, restful comfort in motion, account for this.

That is why so many women are Essex owners. They appreciate its safety, too. Its controls are simple and instantaneous. It makes fast time, with security, even in difficult traffic.

Essex Wins On Quality Minus Useless Weight

Essex won recognition on the issue of finest quality without useless weight and size. That issue is uppermost today.

You will take pride in your Essex from the first. Its beauty, luxurious fittings and its performance give it distinction everywhere. And time will increase your respect for it. You will come to rely absolutely on its dependability. You will find it always ready for any demands you may make.

These are reasons why Essex set a world's sales record in its first year. And orders are now so far ahead it is certain even that unrivaled mark will be surpassed this year.

Thousands, realizing this, are placing their order now. We advise that you do the same, to avoid disappointment.

Essex Motors, Detroit, U.S.A.

Stops Profit Leaks

The business man's profits are increased by stopping leaks. The business *farmer* increases profits by eliminating wasteful, costly power methods—by adopting the efficient, economical "Caterpillar" way.

The "Caterpillar" Tractor is built for service. It does the *exceptional* work that no other tractor can do. But it is not only to meet the exceptional conditions that the highest standards of design, workmanship and material are used in this tractor. Of even greater importance is its ability to do the ordinary every-day work well—to give consistent, continuous performance.

Thus our greatest pride is not in the "Caterpillar" Tractor's victories in scores of competitive tests, nor in its astounding achievements in war work, but in the fact that this tractor is lessening labor and reducing power costs on thousands of farms, giving the same trouble-free service year after year.

Plant Kaffir Corn

SCHROCK (Dwarf) The Only Variety in the Kaffir, Maize or Sorghum family absolutely Immune from the Ravages of Birds

The kernel is protected by sort of a husk and thereby hangs the tale of its immunity from birds. Single heads of this variety have frequently matured to one foot in length and weighing half pound or over. This corn was found or discovered in Oklahoma in a field where Gulis fed in the spring; being submitted to the Kansas Experimental Station for testing it was pronounced the greatest acquisition to the corn family, and various other state experimental stations have given it the highest awards. Has been thoroughly tested out in California and proven meritorious along every line. Will mature a crop in very poor or sandy soil with scarce moisture if well cultivated, but will naturally produce a much heavier crop on reasonably good soil. If irrigated, the fodder can be cut back several times during the growing season. Relished by all stock and poultry. A great fattening feed for hogs. If desired can be cut with mowing machine and raked and then put through feed cutter and fed in this way to stock and hogs, or put in silo. But for real concentrated, fattening feed, heads should be cut, when it can either be fed in the head or ground.

Price: Delivered to your station, prepaid, 100 lbs. $14.00; 50 lbs. $7.50; 25 lbs. $4.00. Less quantity, 20 cents per lb. Order while available.

Grafting Old Grapevines

Kindly advise me how to graft old grapevines about two inches in diameter and should the sap flow freely?—Subscriber, Big Foot, Texas.

Answering your last question first, it is rather late for such work in California but perhaps not in Texas. But even in your state the work is best done just before the buds begin to swell, though the sap may flow freely. The operation is performed just as is done in topworking the walnut, fully illustrated and described in the Cultivator of February 14, 1920. Saw off the trunk as near the ground as a straight portion two or three inches long may be found and make smooth on top with a sharp knife. Split stock through middle with sharp chisel down for an inch or two, being careful not to break loose the bark. Cut two scions of last year's growth, with three or four buds each. Shape at base into eveniy tapering wedges, with a bud at base of wedge and the wedge thicker on this than on other side. Drive a narrow wooden wedge into the cieft to keep it open while inserting the grafts. Put these in with the thickest side out and let them lean outward a little, being careful that their bark crosses that of the stock. Pull out your wedge and the job is done. It is so simple and easy that grape growers usually do not cover with wax but mound earth over the whole, leaving but the upper bud on the scions sticking out. In four or five weeks good shoots will be coming from the scions. Select one or two of the strongest on each scion and remove the remainder.

This Month in the Vegetable Garden

Northern California

By A. R. Gould

CONTINUED rains have been very helpful and give promise of a record cropping season, hence we have little excuse for delay in planting. Rotation cropping and successional planting are necessary to keep the family supplied the season through. Have the plots well manured and follow such leguminous crops as peas, beans, etc., with root crops.

Potatoes

Success with this crop largely depends on the character of the soil. A sandy loam is the best and farmyard manures or a good artificial fertiiizer should be applied. Good seed or sound tubers are essential and should be certified as free from disease by the dealer. Another danger is the eelworm, or nematode, which attacks the potato. It is necessary to use clean seed only and destroy any tubers found affected by burning and the appiication of quicklime. Early varieties may be planted at once, such as Early White Rose and Early Red Rose. Plant the tubers two feet apart in rows which should be three feet apart to allow space for cultivating between the rows. Large tubers may be cut before planting and several eyes left for sprouting.

Peas

Sow Little Marvel, Melting Sugar, the edible pod pea, and Telephone. The last two named varieties are tali growing types and will require wire or stakes for support. Keep the cultivator busy between the rows of those previously sown.

Tomatoes

Plant out strong plants of the variety Stone, San Jose Canner, Ponderosa or Earliana. These should be placed four feet apart in rich soil.

Beans

These may be planted toward the middle of the month and the varieties we recommend are: Davis White Wax, Golden Wax, Kentucky Wonder, Refugee, Stringless Green Pod and Canadian Wonder. Sow the bush varieties one pound to 100 foot row and for a row of the pole variety use half a pound of seed.

Lettuce

Make successional sowings of Los Angeles, Big Boston and White Paris Cos. Transpiant and thin out those previously sown.

Corn

At the end of this month sow Country Gentleman, Golden Cream and Golden Bantam. Sow two feet apart in the row.

Carrots

Sow Danvers half long and Early Shorthorn and have the soil well prepared. Sow the seed in rows two feet apart.

Radish

Make successional sowings of French Breakfast and White Icicle, sowing the seed thinly.

Cucumbers, Melons and Squash

Prepare the hills for these by manuring. The hills should be placed four feet each way. Varieties and more details will be given next month.

Celery and Leeks

Prepare trenches for these by heavily manuring at least 18 inches to two feet deep.

Southern California

By D. F. Reichard

WAS it not great! The first good soaking rain for over two years that vistied us recently was certainly great. It has removed all fears as to our having a year of short crops. Coming at the time it did, no doubt that downpour was the cause of some seeds being washed out and of others rotting, but there is time enough to plant again. The warm days of the coming months will develop the plants quickly. Governor Stephens advises us that everyone who has a back yard or a vacant piece of ground near the house should put in a garden to help reduce the high cost of living. The conditions are excellent. It is up to the possessor of the piece of land to do his share.

The first thing to do is to get the land in shape to receive the seed. That is done by plowing deep, turning under all grass, weeds and roughage. Work it down, breaking all the clods and get the plot as level as possible before any planting is done. It is much easier to work the garden if the heavy work is done before the planting is commenced. It is too late now to start permanent garden, the plantings should be confined to annuals. Those who have their gardens started we would advise to be very watchful this month for any garden enemies, especially aphis, which are easily controlled by spraying with a weak solution of Black Leaf 40.

Most everything in the seedsman's catalog may be put in this month. Beans, corn and melons especially are to be planted. Do not crowd stuff, better stuff and larger crops grow

where plants are properly spaced. The hardy vegetables may be planted; beets, carrots, turnips and parsnips, but they are not relished as are the more succulent summer vegetables. Small plantings of potatoes may be made but they should go in as soon as possible because they are less resistant to disease and pest attacks when planted after the middle of April. Onions, too, may be planted and a good crop should be raised, but the seed must be in the ground before the 15th of the month. Use either Australian Brown, Silverskin or Yellow Danvers. These are the best for this time of the year.

What to Plant

Sow seed asparagus for plants to set out next year. Green Globe artichokes may also be grown from seed. Plant the seed now for strong plants to put out next winter. Beans of all kinds, bush and pole string beans, commercial or field beans, and Limas will be planted very extensively this month. Plant a few carrots. They always come in nicely for flavor even though you do not care for them as a vegetable. A few beets will not come amiss.

General plantings of both sweet and field corn will commence this month and will continue until well into August. In the home garden make a small planting of sweet corn every two weeks for a continuous supply. We do not recommend planting cauliflower for a month or so, but small plantings of cabbage may be made. Cucumbers both for slicing and pickles, muskmelons, watermelons and squash, both summer and winter, can be planted with safety. The young plants of this group should be dusted with dry arsenate of lead, tobacco dust or air slacked lime to keep insects and worms away. Plant Iceberg or some smooth leaved variety of lettuce at this time for best results. Kale and kohl rabi may be planted now but they do not do as well as when planted during the cooler months. The same can be said of peas which we do not recommend planting at this time. Turnips and parsnips will grow if planted at this time but they are of better flavor if used as a winter crop. Set out plants of tomatoes, peppers and egg plant. April is the best month for them. Radishes are planted at all times. They will develop quickly during the warm weather. Large plantings of sweet potatoes are made in April. These come off for early harvest.

Southern Arizona

By M. E. Bemis

THE varlety of things which may be planted, or the plants which may be set out, in April begins to narrow from the list of things which the gardener may specialize on in March and February.

It is not too late to plant tomatoes the early part of the month. These may be planted in the ground where they are to grow or the plants may be set out. There should be little danger of frost from now on.

For general planting probably there is no variety that will give as general satisfaction as the old standby, Dwarf Champion. The chief advantage of this variety for hot climates is that it stands up without artificial support and has a sufficient amount of foliage to protect the fruit from sunburn. Plants should be set about four feet apart each way.

Of peppers, Mexican Chili and the Giant Bell are desirable varieties for this section. They should be planted or set out at this season of the year. If desired they may be, like the tomatoes, planted where they are to grow. Probably the plants which are already in the beds ready for transplanting, either of peppers or tomatoes, will be slightly earlier than those which are planted in the ground. However, many gardeners prefer to plant where they are to grow rather than to transplant. These may be put out any time in April, 24 inches apart in the row and the rows three feet apart.

It is a little late for cucumbers, but the early part of the month will do very nicely for general crop. The early White Spine seems to be one of the varieties best adapted to this section. Plants should be set six feet apart. All varieties of summer squash do well here. Winter squash should be planted earlier.

Pumpkins may be planted the early part of the mouth. The Chinese pie pumpkin has proved to be a good variety. Watermelons and cantaloupes for general crop should be planted in March. It is not too late, however, for a succession of such popular varieties as the Tom Watson or Black Seeded Chilian, which are suitable for later planting. The Netted Gem and Rocky Ford cantaloupes would be best for late planting.

Of the smaller root crops, there is not much advantage in planting them at this season of the year, with the exception of radishes and onions to be pulled for green onions. The White Icicle radish is a good variety for these later plantings.

Egg plants can be put out at this season of the year.

The good gardener who is looking ahead and making plans for the fall garden will begin to prepare the land now. The land which has been in lettuce, cabbage or other winter growing crops should have at least a ton of stable manure plowed under before the weeds get too much of a start. Then throughout the summer this land should be occasionally irrigated and harrowed often enough to prevent a growth of weeds. Some have found it advantageous to grow a crop of cow peas to be turned under.

Irrigation of all growing garden crops has to be rather frequent from now on and each irrigation should be, for best results, followed by a thorough cultivation in order to keep a dust mulch on the surface of the ground to prevent the soil from baking. Some gardeners have found that frequent cultivation not only saves irrigation but produces better plants. One gardener claims that cabbage will head very much better where the cultivation is thorough. This is believed sometimes to make as much as 25 to 50 per cent difference in the number of cabbages which head.

R. S. Cook, gardener at the Indian School Sanitarium near Phoenix, states that he has been very successful in planting the smaller seeds in rather heavy soil by having his ground thoroughly prepared and as nearly level as possible, allowing, of course, for the necessary slope, and then planting the seed on the level. He then runs a furrow a few inches from the row of seed. The irrigation water is allowed to run down this furrow as needed. In this way there is a sub irrigation which furnishes the necessary moisture to the seed without wetting the surface of the soil to induce baking. He has found this more satisfactory than the usual method of planting on the sides of ridges.

EELWORM

"The eelworm, or nematode, which infests not only potatoes but practically all vegetable crops and fruit trees as well, occurs in many places in California. There are still large districts which are free from it, and every effort must be made to keep these districts clean, since once in the soil it is a practical impossibility to eradicate it. Potatoes for planting should be carefully inspected by the county horticultural commissioner, and only those free from eelworm should be planted. Soil already infested with nematodes or eelworms should not be planted to potatoes since this only produces more infested potatoes and tends to distribute the pest. Under the standardization law severe restrictions will be placed on the marketing of eelworm infested potatoes during the coming season, so that it will be greatly to growers advantage to avoid planting potatoes on infested soil."

The De Laval Milker

At Annapolis Naval Academy Dairy

Over 250 cows that supply the milk and cream for the boys in the Naval Training School at Annapolis, are milked by the De Laval Milker, which was selected after careful tests and comparisons.

The De Laval Milker is a distinctly different type of machine. It is alternating, positive and uniform in action—every day the same. It is faster, more reliable and more sanitary than any other method of milking, and is sold with full knowledge of the fact that more is expected of the De Laval than of any other milker.

The sanitary features of the De Laval Milker are important in connection with any dairy installation, but are worthy of especial attention where the highest possible class of product is desired and where certified milk is marketed.

Write to the nearest De Laval Office for Milker Catalog, mentioning number of cows milked

Southwestern Possibilities

By A. L. Spellmeyer

THE Southwest has not yet been developed, and although California is supposed to be a state of intensive cultivation, the future holds forth possibilities without limit.

Owing to a prolonged drouth we are now considering possible water shortage through certain rich farming districts and both the cattle and sheep men have suffered loss and hardship, but this state can and will double, triple and quadruple production of everything, from raisins to livestock, within the next ten or 20 years.

The power possibilities have been hardly touched and water is short merely through lack of development of storage facilities which exist in many places. To merely touch upon the San Joaquin, the district now suffering, it is possible to make great storage reservoirs on the Kaweah, Kings, and in fact in a hundred places on a dozen different streams whose flood waters today are not used. Although vast sums would be necessary the power alone developed would eventually pay for the reservoirs and canal systems. Hundreds of thousands of acres of barley land or grazing land would then be transformed into the finest alfalfa, raisin and fruit land in the West.

Right across the mountains from San Bernardino lies a desert, and this desert would grow anything if it had water, and the water can be brought to it from the Bear Valley district by reservoirs on the Mohave and possibly from the same mountain range which supplies the city of Los Angeles.

Iron ore exists in Riverside, in Orange and in other counties, and right at our doors in Arizona and Utah there are millions of acres of undeveloped coal fields, and great quantities of iron ore. Asbestos is not plentiful, but there is one district in Arizona alone where sufficient asbestos to supply this country could be secured.

In Arizona there are unlimited opportunities to build other dams as great as the Roosevelt, and a great expanse of rich dry desert land.

No matter what the essential causes for high cost of living it is very certain we have the natural resources to support 20 times our population, feed them, clothe them and warm them, if these possibilities are developed.

The trouble with the times is that people forget the primer principle that wealth comes from the earth, and when we have long term cheap money for the farmer and stockman we will get more production and it will never be stimulated until it is made profitable. A tithe of the money wasted through the pork barrel, shipping or aviation errors would have put in hundreds of great dams, reservoirs and canal systems, to the great wealth of the nation.

The present general unrest is bad. Capital can't put in these projects and the government won't. It looks as if the farmers were going to be the political deciding factor in naming men and policies, and if that is the case perhaps we will get down again to the earth and facts, give production a profit, safeguard it and develop new irrigation projects.

The Shorthorn in California

California is perhaps attracting more attention from breeders of all kinds of pure bred livestock than any other section. Eastern breeders are just beginning to realize the wonderful possibilities of this state and the prediction is freely made by those who have recently visited this state that eventually California will be one of the important sources of breeding stock. The following article which appeared in a recent issue of The Shorthorn World was written by J. Clark Chamberlain, who is circulation manager of the publication, and should be of interest to those interested in Shorthorn cattle:

"Far away on the other side of the Sierra Nevada lies the richest and the grandest cattle breeding ground in this country. Every Californian will tell you that, and though some of us may be inclined to doubt the statement, one good look serves to convince. The conditions are practically ideal for the breeding of beef and dairy cattle.

"Through summer and winter alike in California the herds of pure bred Shorthorns roam the fields without suffering in the least from weather conditions. Barns are needed, of course, but they are usually shell like structures of no such proportions as those required in Eastern and Middle Western states. Alfalfa grows practically the whole year round, providing a most nourishing grazing food. Grass springs up earlier and grows faster than in ordinary climates—these are some of the reasons which Shorthorn breeders in California give to account for the success of their breeding operations.

"More than 67 years ago one pure bred Shorthorn bull and three heifers were brought across the plains to California, finding their way into the herd of the Howard Cattle Company. This little herd as a nucleus paved the way for more importations and greater breeding operations until today, when the Shorthorn breeders of the Golden State produce just as good cattle as can be found on the other side of the mountains. They still are not strong in numbers, for the comparative sparseness of population has naturally held down extension somewhat, but the quality and numbers in the individual herds is certainly apparent. The winning of grand championship at the International by Little Sweetheart, owned and bred by T. S. Glide of Davis, well supports this assertion.

"Shorthorns are perhaps strongest in the Sacramento Valley country, where eight or ten excellent herds are located, but there is scarcely a valley in all this great country which does not support at least one Shorthorn herd. In this great state, which is large enough to take care of 1,500 breeders of range cattle (members of the California Cattlemen's Association), it is most gratifying to see the steady increase in the pure bred herds. Out of 47 bulls which sold recently at the sale of the California Shorthorn Breeders Association, at least 30 went to the ranges to produce the better kind of cattle. This indicates that where there is, figuratively speaking, one Shorthorn herd in every valley, there ought to be a dozen.

"At present no one man or group of men stands alone in boosting Shorthorns in California. All of the established breeders are cooperating to bring about the greatest need—more breeders of Shorthorns—and mention of a few only is possible. Caledonia Farms is by far the largest Shorthorn establishment, numbering in its herds more than 400 head of pure bred Shorthorns. This herd rivals in size the best the Middle West produces. T S. Glide, Dr. Elberg and C. N. Hawkins, all of Davis, are doing some wonderfully constructive breeding. Their herds are the equal in quality of the best. Then there is the Dibblee Estate of Lompoc, a remarkable breeding establishment, the Carruthers herd of Live Oak, the Miller herd of Hollister and the Ormondale Company of Redwood City—these do not suffer in comparison with the herds of other states.

"A tremendous amount of good is being realized directly from the activities of the university farm animal husbandry department, with Professor Gordon H. True in charge. He and his associates have worked tirelessly to bring about better livestock conditions in the state, and though no breed favoritism has been shown, the campaign for more and better Shorthorns has through his efforts been greatly helped along. The university farm herd is but a comparatively small one, still it serves as a model for those who would learn more about the Reds, Whites and Roans. At the recent association sale held at the farm, one of

The Pride-Prize-Profit-Breed

JERSEYS

If you never owned Jerseys—you've never received "paid in full" value for your feed bills. Jerseys are the most economical cows ever bred. They feed for their udder — not beef and bone.

They produce the richest quality of milk, a butter fat average of 5.37%. They thrive in the cold Northwest or hot Texas. Jerseys are truly the investment breed because they are the most adaptable and most economical.

Ask breeders for pedigrees and prices and let us send you some interesting facts about the money-making Jersey.

The advertisers in the California Cultivator are known to be reliable and we recommend them to our many subscribers.

Professor True's entries brought the top for the females, while at last year's sale one of the bulls entered by the university brought the highest price ever paid for a pure bred bull in California. The state university is each year proving more valuable to the beginners, but in no state is the beginner given a bigger boost than in California by the animal husbandry department of the university farm.

"There are no county Shorthorn breeders associations in the state of California. (The breeders of Glenn County organized the Glenn County Shorthorn Breeders Association last summer.—Editor.) All breeders are brought together in the one organization called the California Shorthorn Breeders Association. D. J. Stollery, as secretary of this association, comes in for a great deal of strenuous work, but the results produced must prove an ample reward for him. With only one state organization, the results are easily seen, as every breeder in the state is a member of the association.

"Marketing and transportation problems may seem an obstacle in the way of the breeders in the Golden State, but these things will be overcome in time. It will not be this year, nor next year, and perhaps not within ten years, but the time is surely coming when the sun will never set upon the produce of California's Shorthorn herds. Many steps remain to be taken before that time comes, but they are logical steps. The many herds of range cattle are rapidly being headed with pure bred bulls. This one move alone is a great one. Calf clubs are being organized, new breeders are breaking into the game—these are all constructive steps and most encouraging ones.

"Statistics show that 90 per cent of the land in the state of California is being used or can be used for the raising of livestock, and with the present rate of advance, Shorthorn breeders ten years from now should be holding down a goodly portion of that percentage. Our hats off to them if they can make the grade."

CONCLUSIONS OF AN IGNORANT COWMAN

(Continued from Cover Page.)

but shoes have tripled and throughout the list of commodities recent investigations have shown greed and enormous profit percentage for which there is no justification.

How is it possible that our political representatives fail to realize a national viewpoint and continue to feed to a privately despised public "mush of concession" propaganda fodder and ingenious explanation of high living costs, when the people want juicy beefsteak, white bread, warm clothing, and leather shoes at prices within their earnings.

If our candidates are economists they know that watered stock is the principal cause for high prices and that a costly war, wasteful governmental errors, idle men, strikes and side issues are merely contributory, and this must certainly not be a secret knowledge for the few when we see today the greatest drive in our history to get the public to buy bonds and our financiers placing stocks and bonds to many instead of a few so that the inevitable shrinkage will not be the burden on the few who have already collected theirs in the watered industries.

How is it that investigations flivver and the pork barrel reigns supreme with some of the financiers investing in South American cattle and abattoirs or real estate in Germany, when a tithe of these sums would stimulate production. As a nation we loan billions to countries which cannot even pay the interest and our farmers and cattlemen cannot borrow long term seven per cent money to within 75 per cent of first class security.

We hear of widely advertised efforts to help the cattlemen in recent drouths, but that is mere bureau advertising. The protection for the small man on the national forest today is a farce with prevalent hidden systems of controls and dummy permits developed by outfits with large capital. Who saved from the sacrifice of a million Texas breeding stock a few years ago and where was any effort to save the million cattle endangered in the California drouth just passed. We see heralded in papers the wonderful work done to save a few hundred thousand cattle in Montana and Wyoming last November, and the bureaus were evi-

dently so deafened by self praise and blinded by flattery that they didn't know the California sheep men dropped about $20,000,000 of prospective lamb profits, or that 1,600,000 cattle of California were until February 18, 1920 in dire danger of losing a third or more. When in one state of this Union in which half of the cattle and sheep of the state are grazed upon lands controlled by forest and reservation permits the ranges are so administered that one man can control half of the sheep and a tenth of the cattle and contemplate the purchase of a million acres of land as an incident, it is about time for the people to consider the future generation.

The farmers have raised their voice and they expect to get a square deal and the cattlemen and farmers work together, and ambitious politicians will do well to heed the growing murmur. Farmers are conservative, respectors of laws, believe in property rights and a square deal, and it appears from general farm paper comment they intend to get it.

Why doesn't our reserve system recognize long term cattle loans at low interest rates? Why do we in administering our national forest reserves, in which the sale of grazing brings more money than the sale of timber, not allow the new permittee enough stock to make a living instead of forcing him to succumb to the large permit neighbor who is smooth and rich enough to work things out? Why isn't the man allowed to take up and fence enough semi-arid grazing land to support enough cattle to permit his existence? Why are a few thousand Indians held within a great reservation like the Apache, for instance, when these millions of acres of rich land could be tilled and stocked by ten times as many white people and the Indians be supported on the reservation, civilized and educated by example also.

Our country is rich, and its resources as yet merely prospected. When knowing the West as I do, I read about the small amount of coal to each person in the United States, etc., it is laughable. There are hundreds of thousands of acres of undeveloped coal fields in one state of the West, there are unlimited possibilities for water power developments, and the total available horse power as indicated by the same expert is a joke. He hasn't traveled in the West. There are today masses of iron ore which could keep the entire steel trust going for several generations in one little country a hundred miles square. There are valleys which can be irrigated and mesas which can be watered with the cheap power used to raise the water near by, and this country can and will support in the course of time a billion people as easily as it supports a hundred and ten million today. California, the land of intensive cultivation and developed farming, is merely scratched as yet. It has desert stretches which would bloom with water and it has water from a hundred sources, if it is conserved and developed. The Roosevelt Dam in Arizona is a mere pigmy to some dams which could be built in Arizona and there are vast undeveloped desert regions capable of producing oranges, raisins and walnuts as well as cotton and alfalfa.

If a people figure capital is evil and discourage investment and safety for money put in new enterprise, and prevent a profit upon actual developments, things will go on as usual. Now that our farmers are getting busy and showing their political teeth, let us get a lot of these natural resources right at our doors in the West opened up even if we have to do it with the government backing and finance. Let us get loans for cattlemen and for farmers for period terms, and either finance and make our bureaus practical or get some better men in if that is the trouble.

All this labor agitation and political muddle is pretty small in its final analysis as compared to the production of food and development of natural resources. All any good union man can want is a fair wage, a living and education for his family, some lesiure for self improvement, and a chance to save money. All that any good capitalist can ask is a reasonable profit on the actual investment of the hundred cent dollar, but both must eat and both must be clothed, and as union labor is mostly in the manufacture or transportation of products it is essentially dependent upon the farmer and livestock growers prosperity, and that at present needs protection.

COUNTY DAIRY COW CONTEST

Adviser Hodgson of Los Angeles County announces arrangements nearly completed for an annual county dairy cow competition involving nearly $5,000 in prizes. The prizes will be given for grades and pure breds, with a large number of classes in the competition. The test will not begin until probably July 1, and it will have the assistance of Dean Van Norman of the State University and Sam L. Greene of the dairy council and of others deeply interested in dairying in California.

Southern California Holstein Breeders' 1920 Spring Sale

120 Registered Cows, Heifers and Bulls

Rhoades & Rhoades Sale Pavilion
Clearwater, California

Tuesday and Wednesday, April 27-28, 1920

This offering features one of the best collections of the breed yet offered in Southern California. An extraordinary lot of heavy producing cows, fresh or heavy with calf to some of the state's foremost bulls, will be an attraction of more than ordinary interest.

KING PAUL KORNDYKE VALE, one of the most richly bred bulls in the west, will be sold, as he heads the herd of W. D. Millard, Arcadia, which will be dispersed in this sale. The sire of this remarkable young sire is King Korndyke Sadie Vale, the only 40 lb. bull to produce a 40 lb. daughter, and the dam is a 31 lb. daughter of Sir Sadie Cornucopia.

SOME EXTRAORDINARY COWS with good short time records and excellent 305 day records will be sold by Burr Farm, Los Angeles, most of them bred to the sensational young sire Sir Veeman Korndyke Pontiac, whose first daughters to freshen have made up to over 24 lbs. butter in 7 days as 2 year olds.

ROSAMAINES RANCHO, Riverside, will sell granddaughters of Prince Geische Walker and Tilly Alcartra, bred to King Pontiac Netherland Segis 3d, whose first daughters to freshen have made records that place him among the leading younger sires of the breed.

P. H. KRICK, Anaheim, will make an offering that is made up largely of granddaughters of the great King of the Pontiacs, most of them bred to King Winnie, son of the first cow to make over 1200 lbs. butter in one year in California.

CHAS. S. HARRINGTON, Compton, sells a number of granddaughters of the famous producing and breeding cow Pontiac Clothilde De Kol 2nd, the first cow to make over 1200 lbs. butter in one year or over 37 lbs. in 7 days. These are out of highly bred dams with records up to over 30 lbs. butter in 7 days.

BOST & JOHNSTONE, Corona, sell a granddaughter of King Segis and a granddaughter of King Korndyke Sadie Vale, two heifers of exceedingly rich breeding.

AGEE BROS., Rivera, sell some well bred females bred to TOYON FAYNE VALDESSA, who is a son of King Valdessa, and out of a 30 lb. daughter of King Hengerveld Aaggie Fayne.

W. T. McALISTER, Los Angeles, has a choice offering composed almost entirely of granddaughters of such famous animals as King of the Pontiacs, King Segis Pontiac, and Tilly Alcartra.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; NO ANIMAL TUBERCULIN TESTED

Auctioneers: Col. Ben A. Rhoades, Harold B. Rhoades, Los Angeles.

A Sensational Holstein Offering

The dispersal of the W. J. Higdon herd of registered Holsteins, excepting the daughters of King Korndyke Pontiac 20th, ranks as the outstanding event of the year in Holstein sales.

This herd is one of the greatest collections of the breed ever on one farm in the west, a herd that was selected at the beginning with rare judgment, has been developed along the most constructive lines, and is today composed of outstanding young cattle that are only just at the start of their usefulness as producers and breeders. The sale will be held at

Tulare Sale Pavilion, Tulare, California

Wednesday, May 5, 1920

Six 30 to 36 Pound Cows Go Under The Hammer!

The list of high record cows includes HOLLYWOOD LILITH PONTIAC, 36.20 lbs. butter in 7 days as a senior 3 year old, the California record, also the two cows that were originally selected from Mr. Higdon's herd to go to the St. Paul Sale. The offering also contains

A COW WITH OVER 1000 LBS. BUTTER IN ONE YEAR!
A 2 YEAR OLD WITH OVER 800 LBS. BUTTER IN ONE YEAR!
A 3 YEAR OLD WITH OVER 800 LBS. BUTTER IN ONE YEAR!
DAUGHTERS OF MANY OF THE GREAT COWS THAT HAVE BEEN DEVELOPED IN THE HERD!
A WONDERFUL LOT OF DAUGHTERS OF PRINCE RIVERSIDE WALKER, THE FIRST TO FRESHEN WITH RECORDS UP TO OVER 22 LBS. BUTTER IN 7 DAYS AS 2 YEAR OLDS!

The female offering has never been exceeded in quality in any public sale offering in the west, even the picked sales, and it will be a very rare opportunity to buy high record, clean young cattle of very high type.

Who Will Own King Korndyke Pontiac 20th?

KING KORNDYKE PONTIAC 20TH will pass into new ownership in this sale, and the man who is fortunate enough to buy him will have at the head of his herd one of the greatest of the present day Holstein sires. He has everything required in a real herd bull, and his two first daughters to freshen prove his transmitting ability.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL OVER SIX MONTHS OLD TUBERCULIN TESTED AND SOLD SUBJECT TO RETEST BY THE BUYER.

Live Stock News Notes

LIVESTOCK SALE CALENDAR

Holsteins

April 20, Bonita Stock Farm, Lodi.

April 27-28, Southern California Consignment, Clearwater.

May 5, W. J. Higdon, Tulare.

May 6, R. C. Sturgeon and others, Tulare.

May 12, Leeman & Kilgore, Dispersal, Ripon.

Shorthorns

June 17, C. W. Anderson, Burkbank. Dispersal.

Poland Chinas

April 3, Kings County Pig Club sale, Hanford.

April 24, W. T. Dice and Harrold Waltz, Hanford.

Peter Hopley, Atlantic, Iowa, one of the leading Shorthorn breeders of the Middle West, has been spending the winter in California. Mr. Hopley recently visited the herds in the Sacramento Valley.

Glenn County has taken the lead in the organization of the county unit breed association by the recent election of officers of the Glenn County Berkshire Breeders Association.

Vernon Dubel, Kaweah, Tulare County, who is establishing a herd of Poland Chinas, writes that he will name his herd the Gigantea Herd, and that he has secured the boar, Big Orange, a son of Liberty Bond, and adds that at 11 months he stood 32½ inches high and measured 62 inches in length. A half interest in the boar has been sold to W. E. Martin of Visalia.

Castleview Ranch, Santa Rosa, has recently shipped a fall gilt by Achiever to F. L. Hall of Perris.

The Western Berkshire Congress has arranged to hold its first community consignment sale in Marysville, Saturday, April 24. This will be the first of a series of such public sales to be handled by their newly appointed field manager, B. S. Bennett.

John C. Burns, formerly at the head of the animal husbandry department of the University of Texas, and who judged the beef classes at the 1919 California state fair, has been appointed field representative for the American Shorthorn Breeders Association for the state of Texas. California breeders are planning to engage the services of a field man to assist in the promotion of their breed.

The Italian Vineyard Company, Guasti, has just received from Castleview Ranch that grand Berkshire sow, Miss Villa's Laurel, full sister to Real Type, the great Barker boar. This sow has been a great prize winner in the past and is now bred to Achiever for a spring litter.

M. Bassett, Poland China breeder of Hanford, recently purchased from M. A. Dowling, Valley Junction, Iowa, a bred gilt sired by Fair Acres Joe and bred to The Rainbow.

The prospects for a big show of Berkshires at the coming state fair are very bright. A great spirit of friendly rivalry seems to be developing among the Berkshire breeders and many herds, not previously represented, will be there, prepared to win the purples and blues.

Clarence V. Castle, who has been an instructor in the animal husbandry division of the college of agriculture, University of California, has resigned to enter government work.

Breeders will be interested to learn that the Sonoma County fair will be held in Santa Rosa August 25 to 29. Full classes for all breeds will be arranged, with liberal premiums. This fair will be held just previous to the state fair.

Anderson and Fogarty have purchased from George E. Dierssen, Sacramento, a young Holstein bull sired by Sir Aaggie De Kol Acme and out of Miss Blaney Walker. The dam of Miss Blaney Walker was Miss Blaney, a Morris cow with a record of 1,008 pounds butter in 365 days.

The high school of Marysville has adopted the Berkshire for their pig club organization. Owing to the scarcity of Berkshires much difficulty was found in obtaining the required number. Castleview Ranch of Santa Rosa contributed several good ones.

E. Every Newton is the owner of the 50 acre Arenal Ranch at Lankershim in the San Fernando Valley where alfalfa is supreme. The Arenal Ranch is noted for its excellent equipment for breeding purposes, the housing and pasturing facilities being ideal and complete, with water piped to every compartment. The three most popular breeds are represented, with select blood lines. There are Poland Chinas, Durocs and Hampshires—120 March pigs in the pens. A special attraction in the Duroc section may be seen in the 12 months boar Arenal Critic by Crimson Colonel, dam Arenal Rose by Superior Critic 2d, dam Miss Liberty, a granddaughter of the great Enchantress, first prize aged sow at Sacramento, 1918. This big fellow is a typical Duroc of the most popular pattern. Fred Calloway, formerly herdsman for a term of years at the Donald H. Graham ranch, is in charge.

Fred Gatewood, Poland China breeder of Fresno, is now in the East attending a school for auctioneers. After completing the course it is Mr. Gatewood's intention to return to California and engage in business.

An Unusual Holstein Offering

In the usual public sale of registered Holsteins the buyer of young heifers and heifer calves has a small range of selection, but here is a sale made up entirely of heifers and heifer calves, and a lot of choice young bulls.

This is a COMPLETE DISPERSAL of the young registered Holsteins at

Bonita Stock Farm, Lodi, Cal.

Tuesday, April, 20, 1920

This herd of young things is one of the typiest offerings yet made in the state. They are well grown, well marked, in splendid condition, and of most substantial breeding.

63 Heifers and Heifer Calves

There are a few bred heifers in the offering, and the rest range from yearlings down to young calves. A large number are sired by SUPREME GLISTA PIETJE, whose dam twice made over 32 pounds butter in 7 days and made 631.35 lbs. in one year, and his sire's dam made 827.31 lbs. butter from 18623.7 lbs. milk in one year. The dams of these heifers are splendid young cows, a large number with official records up to over 26 lbs. butter in 7 days, and most of them have cow test association yearly records that will be valuable in guilding the selection by buyers.

27 Excellent Young Bulls

Every bull in the herd will be offered in this sale. Quite a number are now ready for service, and most of them are sired by SUPREME GLISTA PIETJE, mentioned above, and out of some of the best cows in the herd. This is one of the real opportunities of the season for dairymen to secure good young bulls.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; NO ANIMAL TUBERCULIN TESTED.

Tulare's Best Consignment Sale

65--Registered Holsteins--65

Unquestionably the best offering of registered Holsteins ever made at Tulare in a consignment sale will go under the hammer at

Tulare Sale Pavilion, Tulare, Cal.

Thursday, May 6, 1920

R. C. STURGEON, Tulare, sells his entire milking herd and some choice heifers, many with high records, and all of breeding age in calf to SEGIS PONTIAC ABBEKERK, 35 lb. son of Segis Pontiac De Kol Burke.

R. F. GUERIN, Visalia, will offer one of the very best consignments he ever made to any sale, including a great 28 lb. cow, a 25 lb. cow that has a 24 lb. 2 year old daughter, three granddaughters of King Korndyke Sadie Vale, and others of excellent breeding, all bred to King Sadie Vale Idyl Segis, whose dam is a 35 lb. daughter of King of the Pontiacs.

ALEX WHALEY, Tulare, sells two beautiful heifers, one of them a daughter of the three times grand champion bull King Segis Alcartra Prilly, both of them bred to Sir Aaggie De Kol Acme 2nd, five of whose seven nearest dams average 1154 lbs. butter in one year.

THE VICTORY HERD, H. E. Spires, Caruthers, will offer four excellent females bred to SIR PIEBE DE KOL SEGIS PONTIAC, son of the famous King Segis Pontiac Count, and whose first daughter to freshen as a 3 year old has made the Kansas record for any age of over 33 lbs. butter from 699 lbs. milk in 7 days.

LES McCRACKEN, Ripon, sells ten open heifers, most of them ready to breed, all of them of excellent breeding, including several granddaughters of Colantha Johanna Lad.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL OVER SIX MONTHS OLD TUBERCULIN TESTED AND SOLD SUBJECT TO RETEST BY THE BUYER.

PRODUCTION

"FEEDFINE" FEEDS

are scientifically compounded in proper proportions for dairy and all livestock feeding, of the following ingredients with the most economical results always in view.

YEAST — A concentrate high in PROTEIN and FAT content, sterilized and predigested.

CANE MOLASSES — The richest of feeds in carbohydrates—produces increased appetite on account of its palatableness. Its consumption results in increased energy and it is the best tonic known for animals.

ALFALFA MEAL — Gives body to the ration and supplies the mineral matter which is absolutely essential to all animals.

The greatest known combination for health, strength and productiveness.

CARE OF NEW BORN CALF'S NAVEL

Each year many calves die as a result of navel infection. This trouble, like many others, is more easily prevented than cured and for that reason the following suggestions by Dr. G. H. Conn of the Iowa state agricultural college which appeared in a recent issue of The Shorthorn World should be carefully heeded.

"The navel cord, as it is usually called, is the normal means of maintaining relation between the mother and her unborn young. It is composed of arteries and veins with a small hollow canal known as the urachus. These are all enclosed in a larger membranous tube and surrounded and held in their proper relation by a loose connective tissue. The arteries and veins carry the blood to and from the unborn calf, and it is in this way that it is nourished before birth. The urachus leads from the bladder and is for the purpose of carrying the urine and other waste products from the body of the unborn calf. It can be readily understood that the navel cord would be of no use after the calf was born.

"When the calf is born this cord must be divided and the relation between the mother and calf discontinued. This is usually ruptured when the calf is born (but as the cord is very long in the calf this does not always happen). When it separates at birth it usually separates about one and one-half inches from the abdomen, where there occurs normally a soft ring in the cord. If the cow is lying down the cord usually ruptures when the cow gets upon her feet, but if the afterbirth is passed it may not rupture until the calf struggles to get upon its feet. In occasional cases it may rupture five or six inches from the abdomen, which is not at all abnormal.

"When the navel cord ruptures normally a few drops of blood may ooze from the arteries, but they soon contract well within the abdominal cavity away from any dangers of infection. The vein usually remains in the position it occupies when it ruptures, and the few drops of blood that it contains flow away soon after the cord separates. The urachus contracts very forcibly and finally comes to rest within two or three inches of the bladder. Under normal conditions the jelly like substance in the end of the separated cord, that is know as the 'Whartonian jelly,' works out of the end of the stump and the cord dries up quite rapidly. Under normal conditions this healing takes place very rapidly and without any infection gaining access. If this mass of tissues dries up, it seals the opening here against any infection and that is just the thing we are looking forward to.

"It is a common practice to tie or ligate the navel cord in the new born calf. All practical experience tends to show that this is a very detrimental procedure and one that is attended with much risk. By ligating the stump the arteries and urachus are prevented from contracting to within the abdominal cavity, the Whartonian jelly is prevented from escaping. Instead of promoting drying of the cord, this hinders it and tends to keep the stump of the cord moist for a greater length of time. It increases the danger from disease germs, as it provides a better medium for their growth. As a result of this the urachus frequently reopens and drivels urine for several days. (Proof that this is not a good practice can be seen in the much greater number of cases of navel-ill and fatal infection we have in the young foal compared to the calf, where tying the navel is not so commonly resorted to.) When it is practiced the Whartonian jelly should be squeezed or milked out and the stump should be tied with a piece of sterile cord. The stump should be frequently and thoroughly disinfected with a reliable disinfectant, such as Tr. of iodine, creoline, etc., several times each day.

"If the navel cord ruptures too long in the calf it should be divided by the attendant at the soft ring which is found from one and one-half to two inches from the abdomen. This can often be done by catching it between the thumb and first finger of either hand, on both sides of this ring, and pulling it apart. When this cannot be done it should be scraped in two with the thumb nail or a knife; when handling the navel cord the hands and every instrument used should be thoroughly cleaned and disinfected.

Watch the Udder

Keep the "business end" of the cow on the job of milk-giving. Injuries to teats or abnormal udder conditions reduce production, make the cow restless, and render milking difficult.

Bag Balm is a wonderful penetrating, healing ointment designed especially to restore the normal healthy texture to congested, caked or inflamed udders and to heal any external cut, chap, bruise, chafing or extreme soreness. A sure remedy for Caked Bag, Cow Pox and Bunches.

Keep the udder soft, silky and healthy and teats smooth and clear. The production will be increased and milking will be a pleasure.

Buy your package of Bag Balm from your feed dealer, druggist or general store—sold in liberal 60c packages. Send for free booklet, "Dairy Wrinkles."

"The proper method of handling the navel cord in the new born is to assist in its rapid drying. This lessens the chance of infection, as disease germs grow best in a moist, warm place. In the first place, the Whartonian jelly should be squeezed or milked out and then some good antiseptic drying powder should be dusted on the stump of the cord. Equal parts of pulverized alum and boracic acid or tannic acid and zinc oxide make a good powder for this purpose. Another good preparation is one ounce of formaldehyde (formalin) to three ounces of water. This will dry the cord up very rapidly. Should be painted on the cord every 15 to 30 minutes with a small brush or the cord may be immersed in it. It may produce some irritation if it gets on the skin. In using the powder it should be applied every one or two hours until drying has taken place. Tr. of iodine may be used upon the stump, but formaliln will induce drying quicker than any other substance that we know of and is very efficient. No danger in using it and ordinary care will yield good results.

"Prevent the greater part of your losses with your young calves by omitting the ligation of the navel cord, and simply assist nature in securing a dried up stump, which automatically eliminates the dangers from infection. The ligation of the navel is simply a custom handed down from earlier times and should he forgotten for the best interests of the cattle industry."

RANGE CALVES FED SILAGE

The Prescott dry farm, one of the experimental farms of the agricultural experiment station of the University of Arizona, has made a study of the production of silage crops and the making and feeding of silage. Papago sweet corn, club top cane and hegari appear to be the best crops for silage in the Prescott district.

County Agent Fillerup of Snowflake recently stopped off at the station and at the L. L. Bates Livestock Company at Prescott, where successful silage feeding to range stock has been carried on for the past several years. Mr. Fillerup reports as follows:

"The L. L. Bates Company is weaning its range calves in the fall and feeding them through the winter on silage without other roughage and without grain. Calves four and five months old soon learn to eat silage with a relish and come out in the spring in better condition than if left on the range with the cows. They also grow faster than those allowed to run at large. Since the cows are not required to carry the calves through the winter, they also do much better and come out in the spring in good, thriving condition. As a rule the calves are fed at the rate of about 12 pounds of silage per head and this is increased somewhat as the animals grow.

"In addition to wintering the calves on silage, the company is feeding out a number of beef cattle. These are fed all the silage and alfalfa hay they can eat. The gains are entirely satisfactory. Feeder hogs in the feed lots make remarkable gains, though they are not fed other than in connection with the cattle."

COMPARE WITH FEED COSTS

A dispatch from Chicago gives livestock prices and refers to prices in former years, as follows: Choice 300-pound hogs went at $14.25. Three years ago the best hogs went at $14.85, four years ago at $9.90, and five years ago at $6.90."

It is interesting—or perhaps uninteresting—to the hog raiser to make comparisons of these prices with those of feeds at the same time.

Prof. C. L. Roadhouse of the University recently addressed the farm center at Merced and recommended a greater number of dairy cows for that section before an effort should be made to start a creamery.

The California farm bureau federation has committee working on plans for marketing spring clip of wool.

Cloverdale farm center is discussing county fair, also matters concerning the livestock industry.

The Modesto cow testing association reports 56 cows securing place on the roll of honor in March.

Another Brilliant Record Made at Annual Guaranty Sale

Another fine page of Holstein history was written when 71 head of bulls and females were sent through the third annual Guaranty Sale at the state fair grounds, Sacramento, Thursday, March 25, for a general average of $901. While the average established was somewhat below the average of last year's sale, this year's was remarkable in many ways and must be rated as one of the most successful sales ever held in the West.

Among Those Present

Left to right, A. J. Stalder, Riverside; E. Burr, Los Angeles; Ben A. Rhoades, Los Angeles; Jas. J. Jefferies, Burbank; Robert N. Clapp, Nuevo; G. M. Brown, Los Angeles; David Maxwell, Waterloo, Iowa; Mr. Dundas, Riverside.

Indeed, it was stated that no sale ever made such an average that did not have at least a $5,000 top. The extreme high quality of the offering is indicated by the uniform range of prices. Only two animals crossed the $2,000 mark. One of the most satisfactory features of the sale, from the standpoint of breed promotion, was the fact that very few of the established breeders were buyers—nearly all of the offering was absorbed by new men or by men who have not been long in the pure bred business. Such a situation indicates the splendid development that the Holstein breed is enjoying in this state.

It was generally conceded that the class of the offering, especially the female division, was quite the best ever assembled in the West, and the fact that such fine foundation material was made available to new men presages much for the future and is sufficient justification for the efforts made by the breeders to hold at least one such sale a year. No buyer can feel that he has made an investment that will make it difficult for him to realize a handsome profit if he gives proper care to his purchases.

Speaking generally it can be said that the better things in the sale were the cheapest.

Sixty-four females, ranging in age from very young heifers to mature cows, averaged $884, and seven bulls, all youngsters, averaged $1,060.

The top of the sale was registered by the Higdon 33 pound cow Ida Lotta Winifred Burke, a daughter of Winifred Hotaling, one of the 12 cows in the breed that have produced three 30 pound daughters. She was taken by R. L. Holmes of Modesto for $2,300 and was a real value. Holmes also secured Eldorado Winifred with a 30 pound four year old record and from a half sister to the dam of the top cow for $1,850. Holmes displayed fine judgment in his two selections.

W. J. Higdon of Tulare had the top consignment, averaging $1,610 on five cows, all of which had records of 30 pounds or better. Trout Brook Pontiac Starin, a 35 pound granddaughter of King of the Pontiacs, went to H. G. Ball of Tulare for $1,800; Sir Skylark Ormsby Hengerveld Pet 2d, with 32.01 pounds butter to her credit, sold to the Napa State Hospital for $1,500; Madrigal Mooike 2d, a 32 pound senior three year old, was a splendid buy at $1,400. Anderson and Fogarty, young breeders near Sacramento, made a capital selection when they got Leda Hengerveld De Kol Korndyke, heavy in calf to King Korndyke Pontiac 20th, at $1,050.

A $1,300 Heifer

S. V. K. P. Clarie of Sunnyside, bred and sold by R. F. Guerin, Visalia to T. A. Sparks, Winters. One of the highest priced Holstein heifers ever sold in the West.

James J. Jefferies of Burbank made his debut as a seller with an attractive consignment topped out with a 30 pound senior three year old that was purchased by David Maxwell of Waterloo, Iowa, for $1,000.

R. F. Guerin of Visalia sold a particularly desirable lot of young things headed by the 24.64 pound two year old daughter of Sir Veeman Korndyke Pontiac, S. V. K. P. Clarie of Sunnyside, that was taken by T. A. Sparks of Winters at $1,300.

Bridgford Holstein Company, Patterson, made a strong try for the bull top and landed dangerously near that position when H. E. Spires of Caruthers paid $1,900 for the year old son of King Segis Alcartra Prilly, and from a 36 pound dam.

Much interest was accorded the consignment from Carnation Stock Farms, Seattle, and in view of the famous bulls to which the females were bred their selling prices looked like real bargains. Laconner Pontiac Bessie, bred to Matador Segis Walker, topped the Northern consignment at $1,650, going to R. Stevens of Stockton. Cantate Dominion Sir Skylark 3d, carrying the service of Carnation King Sylvia, was taken by H. H. Sisson of Willits at $1,600.

One of the most uniform and desirable groups in the sale was contributed by A. J. and F. W. Stalder of Riverside and buyers were eager for the daughters of King Pontiac Netherland Segis 3d, the bull that is making such a fine record in the Stalder herd.

The Milky Way Farm, owned by A. E. Smith, Sumas, Washington, had the top bull, Ensign Korndyke Model Pontiac, a year old son of Chimacum Spring Farm Pontiac. He was taken by H. H. Sisson at $2,050 and it is expected that he will be heard from in the future.

One of the best bull buys was made by F. L. Pellissier of Whittier who secured the richly bred calf, Tosantos Walker Pontiac, consigned by E. D. Barry, Jr., of Daggett. At $750 the buyer, who is establishing a fine herd, can count himself very lucky.

Toyon Farm Association, Los Altos, contributed one of the choice consignments. It was from that herd came the valuable young bull, Sir Toyon Model Hartog, purchased by W. J. and B. A. Edwards of Ripon for $1,100.

Fred W. Kiesel of Sacramento sent forward a real star in Uneeda Mutual Korndyke Segis 3d, and Burr Farm, Los Angeles, the heaviest buyers at the sale, secured her at the conservative price of $1,200.

Longheath Farm, Fallon, Nevada, the leading Holstein establishment of that state, sold a son of their herd bull, King Ormsby Canary Johanna, that should prove a fine investment to his buyer.

The J. S. Gibson Company of Williams had a number of choice entries

The Cheapest Feed to buy is the Best

Great Western Milling Co.-
Gentelmen:
Comparing the price of all available food stuffs and their producing values, We are satisfied that your "Besgrade Dairy Feed" in combination with alfalfa hay and corn silage is giving the best possible results at the lowest cost. Thanking you for the help of your specialty man in keeping us posted on the prices
Yours Truly
O. J. Hall & Son
East End ave, Pomona Calif.
Nov. 26-1919.

Feeding cheap feeds is not economy.

No other factor will decrease your milk yield as quick. Poor cows and poor feed absolutely spell failure.

Stop feeding poor cows and stop feeding cheap feeds.

BESGRADE
Dairy Feed

is absolutely guaranteed to increase your present milk yield—because it is a feed that is balanced against the roughage you feed. It contains all the food elements necessary for heavy milk production.

You are not experimenting with Besgrade Dairy Feed—because the experience of the oldest manufacturer of balanced rations is back of it and guarantees it to produce better results than you are now getting.

Do you want to increase the milk yield of your herd? Write and ask us about guaranteed results.

Great Western Milling Co.
Los Angeles

and

Northwestern Milling Co., San Francisco

that sold below their real values, particularly the 18 pound two year old daughter of Segis Creamcup Pontiac, that went to Burr Farm for $725.

Santa Anita Rancho sold an excellent value to E. D. Barry in a two year old daughter of Prince Gelsche Walker.

One of the valuable things that changed hands was the great white cow, Ontario Blonde Pietje, with 33 pounds butter to her credit. She was consigned by Dr. E. J. Weldon and was purchased by Dr. F. J. O'Donnell of Tulare for $1,525.

Leeman and Kilgore of Ripon sold the first daughter of King Korndyke Pontiac 20th ever offered at public sale and she was bought by Higdon at $750.

R. L. Holmes of Modesto and R. C. Sturgeon of Tulare each sold one head.

Burr Farm, Los Angeles, were the heaviest buyers, securing 20 head. Manager Brown made his selections with rare judgment and was a persistent bidder on the best entries. C. T. Sierra, Jr., of Santa Rosa was also a heavy buyer.

Aside from the California buyers, Nevada, Oregon and Iowa were represented at the sale.

As usual the sale was managed by C. L. Hughes of the California Breeders' Sales and Pedigree Company, Sacramento, and much of the success of the event was due to the untiring efforts of Mr. Hughes. Ben A. Rhoades of Los Angeles demonstrated his ability and staying qualities when he stuck to the block for over eight hours' selling, the sale lasting until ten o'clock. Col. George Bell of Tulare worked the ringside.

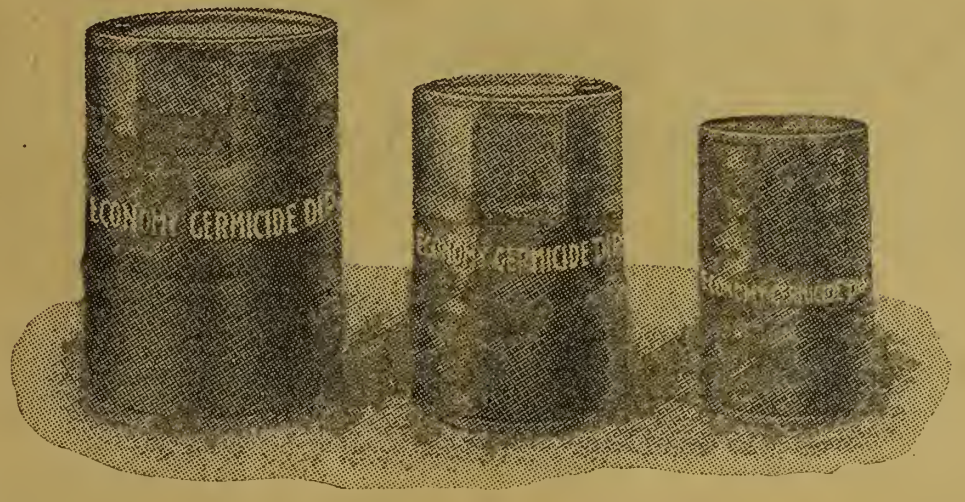
(Continued on Page 599).

Springtime Is Clean-up Time



With the coming of Spring millions and millions of disease germs that have lain dormant through the Winter take life and breed and multiply. Springtime is clean-up time.

It is the wise stockman today who, upon the first approach of Spring—gives his premises a thorough disinfecting — cleans out the chicken houses—disinfects the barns and lots—and cleanses the stock thoroughly.

This is the age of sanitation. Never have we seen such a demand for a good Dip—farmers and stockmen who a few years ago considered from one to five gallons enough for a season, now use from twenty to thirty gallons a year. Thousands of feeders with an average size herd use 50 gallons a year—and consider it one of the best investments on the farm. During the month of January our Dip business showed an increase of over 100 per cent as compared with January, 1919. There must be a reason—Economy Germicide Dip must give satisfaction. It does.

Economy Germicide Dip comes in five gallon cans—also 15—30—and 50 gallon steel drums. The drums are handy, fitted with lock faucet—no waste whatever. Write—let us know the quantity of Dip you use and we will give you price and terms.

The Importance of Lime in Agriculture

No soil is complete withtout a fair percentage of available lime, and it is almost impossible for any soil devoted to intense culture to contain too much. To keep a soil sweet and in proper condition to produce leguminous and other crops to the fullest advantage, lime should be used in quantities of from half a ton to five tons per acre, and such applications would very often mean the difference between success and failure. It is not intended to suggest that lime only is required, but it is certainly one of the first treatments any soil should receive, where such soil is known to be wanting in this particular element.

The effects of liming are many and various, and are not as fully realized as should be tbe case. Liming neutralizes acid in the soil and makes it more alkaline, reducing the amount of sorrel and greatly increasing tbe growth of peas, beans, lucerne, and all other crops. It causes nitrification to a greater extent, thus providing more nitrogen—one of the most necessary plant foods—for the crop's benefit. In addition, liming sets free the otherwise locked up potash in the soil and so allows the crop the use of another important plant food tbat might witbout liming be unused. Applications of lime kill the larvae of insects and so save much loss to market gardeners in time and material.

Soil temperatures are raised where lime is applied, and quicker growth naturally follows. The quality of both green feed and vegetables is better where there is sufficient lime available, and provided fertilizers are used in proper quantities, the soil will go on producing for a longer period. Tbe mechanical effect of lime is also valuable, as it renders a clay soil more friable by drawing together the smaller particles, so making the land more easily worked; in a sandy soil it has the opposite effect, closing it and making it hold moisture better. Lime in itself has an affinity for moisture, and its presence enables the soil to retain moisture longer and to a greater extent.

There are three kinds of lime on the market. One is burnt lime, limestone from which the moisture has been expelled by heat. This form of lime is valuable for swamp lands, especially those containing large amount of undecomposed vegetable matter, which it assists in breaking down, and thus renders such soils usable much earlier than if left to time and nature. Burnt lime is liable to deteriorate, as it absorbs water from the atmosphere, and for tbese reasons should be obtained fresh from the lime works and applied as soon as possible. It should be ground fine for preference when it can be applied more easily and evenly than in the lump. To apply burnt lime to soils already poor in bumus (decaying vegetable matter) is a mistake, as it is liable to burn and destroy this valuable constituent.

Ground limestone is the unburned limestone simply ground fine, and though not as powerful as the burned lime, is safer and more easily applied to most soils. In order to obtain the same amount of actual lime per acre, twice the quantity should be applied as compared with burnt lime. It is about half the price, consequently the freight and spreading are the only two disadvantages. It is slower in its action than burned lime, but is much easier to bandle and spread. Gypsum, or sulphate of lime, is found in natural deposits in very large quantities, and where easily procurable, pays well for distribution upon the soil. It takes 2.7, or, roughly, three times, as much gypsum to give the same effect as burned lime.—T. A. J. Smith in Journal of Agriculture, Victoria.

SETTING PRICES

Commenting on stabilizing, or at least judging as to direction which markets will take, the National Stockman and Farmer says editorially:

"In all our discussion of markets and prices we should remember the great unknown but vital factor of consumption, which is reflected in wbat we call the demand. Some writers and speakers assume that markets may be stabilized by finding out what is to be marketed and then distributing tbe shipments of it over the normal period of marketing so as to avoid an oversupply or a shortage at any one time. That may belp if shippers will follow the plans suggested for the proper distribution of their shipments, but there is little probability that they will do this. It is doubtful, considering all things, whether this plan of regulating sbipments or stabilizing markets will prove any more effective in marketing staple crops and products tban the present automatic regulation by advancing or declining prices. But the experiment will be interesting if it is carried on long enough to afford a basis for conclusions. The extent to which consumers' desire and ability to buy affect markets is generally underestimated, probably because we are in the habit of looking at consumption of necessities as a fairly constant quantity. But examples may be cited from current history to illustrate bow potent this influence is. Take the present wool market, for example. Fine wools are selling at high figures and have been advancing for many months. Medium and low wools are dull and have been so during the period in which fine wools have advanced. Fine wools sbrink most in scouring and make the dearest product. A few years ago tbey sold away below the lighter shrinking medium wools. Why is tbe position of the two reversed now? The reason is clear enough—consumers want the finest fabrics and are able to pay for them. They will not buy fabrics made of medium or low wools even at lower prices, though these fabrics are highly useful and were formerly most popular. Otber examples equally striking might be given, but are not necessary. Tbe point of tbe whole matter is that a market is the result and expression of all influences and it can hardly be stabilized from the producer's side alone."

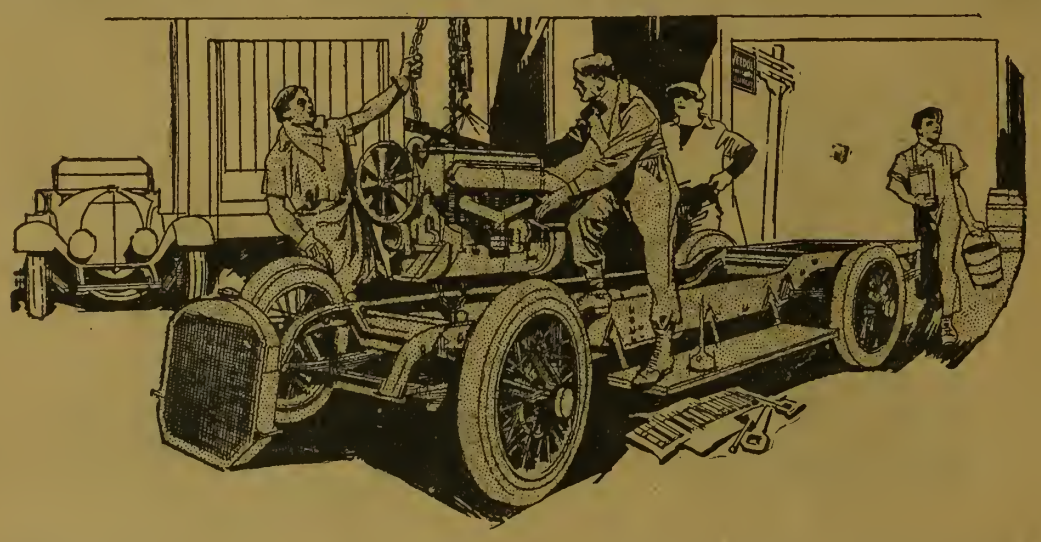
COFFEE IN CALIFORNIA

The question is often asked if coffee may be grown in California and if not, why not. The writer has several times set out plants of the more common and hardy species, or Arabian coffee, Coffee Arabica, in gardens of Los Angeles, ranging from tiny plants to hardwooded subjects several years old and three feet high.

The plants are injured, though not killed, by the lightest frosts. They do not really thrive anywhere in California, but will grow, for a few years at least, where climatic conditions are extremely favorable. A more equable temperature is needed, warmer nights throughout the year, and bigher temperatures during the entire winter season. The annual rainfall should be at least 60 inches, though this could in part be supplied through irrigation and frequent sprayings. But commercial coffee in California is an impossibility unless hardier species are found. —E. B.

GOVERNMENT SAVINGS

The former War Loan Association connected with the federal reserve bank has changed its name to Government Savings Organization. This institution will continue to encourage thrift through the purchase of war savings stamps and certificates.



Which of these troubles has injured your engine?

Scored cylinders, burned-out bearings, fouled spark plugs, played-out piston rings, worn cam shaft, loose wrist pins, sticking or pitted valves

REPAIR shops all over the United States report that these seven common troubles are responsible for 90% of all delay, "layups" on the road, and repair expense.

Yet each of these troubles can usually be prevented. Each of them is *due chiefly to improper lubrication.*

Layups and repair bills due to sediment in your oil

Under the intense heat of the engine—200° to 1000° F.—ordinary oil breaks down. Large quantities of sediment are formed which have *no lubricating value and which thin out the remaining oil.*

Ordinary oil after use — Veedol after use

Sediment formed after 500 miles of running

Excess carbon is formed, valves are pitted. The oil film fails to hold. Cylinders and pistons are scored by metal-to-metal contact. The engine over-heats. Bearings burn out. This is the toll taken by sediment in your oil.

How the sediment problem was solved

To produce an oil that would reduce sediment to a minimum, engineers experimented on the road and in the laboratory for years. Finally they evolved the famous Faulkner Process, used exclusively for the production of Veedol, the lubricant that resists heat.

Veedol reduces the amount of sediment formed in the engine by 86%. This is graphically shown by the two bottles in the sediment test at the left. It reduces evaporation between 30% and 70%—giving long mileage per gallon of oil.

Make this simple test—buy Veedol to-day

Drain oil from crankcase and fill with kerosene. Run engine *very slowly* on its own power for thirty seconds. Drain all kerosene. To remove kerosene remaining in the engine, refill with *one quart* Veedol. Turn engine over about ten times, then drain mixture of oil and kerosene and refill to the proper level with the correct grade of Veedol.

A run on familiar roads will show you that your car has new pickup and power. It takes hills better and has a lower consumption of both oil and gasoline.

Leading dealers have Veedol in stock

The new 100-page Veedol book on scientific lubrication will save you many dollars and help you to keep your car running at minimum cost. Send 10c. for a copy.

SOIL FERTILITY MUST BE REPLACED

There's a certain amount of fertility in your soil. If you take some out, you should replace it, just as you would return borrowed money. In the matter of fertility, the trouble is that our soil is too good a friend. We can borrow, borrow, borrow—not getting so much each time, of course—until we finally conclude there is not much more to get from our friend, and we are at liberty to move away, if we want, and cultivate another friendship.

This, at least, used to be the case, but there is practically no more virgin land and what we have will have to be taken care of.

Reaching Limit of Fertility

Few of us realize how very little fertility in proportion to the whole bulk of the soil there really is. In a ton of ordinary black clay loam there are only 3½ pounds of nitrogen, 3¾ pounds of phosphorus and 60 pounds of potash. When these are exhausted they are gone, that's all.

The best and cheapest general purpose fertilizer and the one that contains the three elements above mentioned is barnyard manure. A ton of it contains 5 pounds of nitrogen, 3½ pounds of phosphorus and a much larger quantity of potash. It is worth at present prices for commercial fertilizer about $5.50 a ton, according to Pennsylvania experiment station Circular No. 67.

$600 Worth of Manure on Average Farm

Supposing you have the average number of stock on the average farm—six cows, three horses and ten hogs. These will produce about 110 tons of manure per year. At $5.50 per ton those 110 tons will have a total value of about $600.

How much will you get in return for that amount of manure? That all depends on how you handle it.

Director C. E. Thorn of the Ohio experiment station says that eight loads put on with a spreader are worth as much as 12 put on by hand. This means a loss of one-third of the above amount, about $200, if the manure is spread by hand. It is hard to realize that the unevenness of hand spreading would make that much difference in comparison with even machine spreading. A good spreader doesn't cost near as much as that loss of $200.

Advantages f Wide Spreaders

In buying a spreader at the present time the farmer should see that he selects one with a wide spread attachment. With such an attachment a strip eight feet wide or better can be covered, extending well outside the wheels on both sides. This has positive advantages over the narrow spreader of years ago. In the first place, the load is thrown off twice as fast and the same amount of ground is covered with just half the driving distance, and on the return it is not necessary to drive so that the wheel tracks lap in order that all ground may receive an even spread. For practically the same price today a wide spreader can be bought that will deliver more in service and include more in quality of construction than an old type machine that only spreads the width of the beater. For these reasons the wide spread machine should be thoroughly investigated before a farmer invests his money in a spreader.

A spreader is the most necessary implement on the farm today. It is a crop producer, whereas most other machines are only crop handlers. It encourages the saving of manure and thereby makes the farmer honest with his soil. He borrows his fertility and doesn't steal it.

DRAINAGE TO THE SURFACE

It is well known that one of the chief causes of arid land becoming alkaline is the drawing of alkali to the surface by moisture which rises and evaporates. The extent of this water movement, however, is often underestimated. In reality it is one of the best examples of capillarity that one readily can point out and has a distinct bearing on the handling of swampy land in rainy sections.

Arid land fully irrigated becomes wet to a depth of 20 feet. The volume of water required to accomplish this would form a lake two or three feet deep over the same area, yet all of this water, practically speaking, would pass to the surface and escape into the dry air within three or six weeks.

The lesson for owners of land requiring draining cannot be missed. If the under soil of their land is equally open, fine and granular, it, too, will pass to the surface immense quantities of troublesome water early in the season. Water logged soil, however, usually is puddled and solid, rather than open and granular, hence has weak capillary movement of water.

The remedy is to begin a course of treatment which will break up and granulate the under soil. The first thing to do is to blast it. The second is to plant heavy rooted crops, which will fill the lower soil with organic matter. The blasting opens and fines the ground down several feet, and the humus keeps it open. Incidentally, the opening and loosening assists direct gravitational drainage to a marked extent. With both downward drainage and upward drainage in good working order, the soil soon becmes dry and mellow.

The danger from alkali, which upward rising water brings in arid sections, does not occur in rainy sections simply because there is enough water escaping downward or through the lower soil each year to leach away the soluble salts. When ground is blasted in dry sections, it should be understood that the danger from alkali is increased, because the upward capillary movement of water will be increased or hastened. This does not mean that irrigated land and dry-farming land should not be blasted if they otherwise demand that treatment, but that surface mulch must be looked after regularly to prevent evaporation so far as possible. For the good of the crops, capillary movement of moisture cannot be too easy. The better the water movement, the better the roots will be supplied with a normal growth.

Experience has shown that in many cases swampy land, obviously demanding tile drains, dries off perfectly as soon as a proper condition of tilth is established. The credit usually is given to the underground drainage established, and that feature of the matter has a large and predominating effect. Yet the drying effect of the drainage into the air is too considerable to be overlooked, especially when the conditions required for it are identical with those required for the securing of the virgin fertility in the soil, and for all around productiveness.

CAPRIFIGS

The J. C. Forkner Fig Gardens, Fresno, has a good supply of mamme and profichi caprifigs for this season. Mamme crop for colonizing caprifig trees ready the latter part of March. Profichi crop ready the first week in June. Orders given prompt attention. Address or see

Mitchell

We save you money
in ways like these

The reason for the many over-values you find in this new Mitchell is largely due to the Mitchell way of scientific manufacture.

We build our own bodies, for instance. The usual way is to buy them outside. But we save the outside builder's profits, and put that money into the car. It accounts for much of the added value.

Then we save in building because we supervise every process. We pay no freight on bodies. We suffer no delays, no compromise in quality.

To build bodies like those on these new Mitchells would cost any assembler much more. We build complete.

You've already heard of the efficiency of the mechanical departments at our great Racine plant, how we save thousands of dollars by investing in the latest machinery, how we applied lessons learned when we worked for the Government building trucks. How we gained new accuracy.

The Mitchell offers several hundred dollars more value because of these ways we save money and put it into the car. You can't find such a wonderful performer, such a handsome car, such an enduring car for anywhere near the price. And we can prove it.

Go to any Mitchell dealer, take a look at this car. Examine it. Compare it. It brings the utmost for your money.

Illustrated booklet sent upon request.

The Sweet Briar Poultry Ranch

By M. E. Bemis

THROUGHOUT the Salt River Valley of Arizona there are a number of successful poultry farms. Just how successful some of these are it would be difficult to say, though all of them seem to be prosperous enough.

I endeavored some time ago to check up some results and the methods which produce the results on a number of these farms and found that there were some who could not give very accurate figures as to the cost of their feed or the egg production per fowl, although I assume that all of them know whether they are making or losing money. Two, both of whom I consider successful poultry men, report quite different results. On one of these farms the cost is 90 cents a year more than on the other and the egg yield is five dozen less.

Of those poultry keepers interviewed the best average egg production covering a series of years has been obtained on the Sweet Briar Ranch. About 1,000 White Leghorns are kept on this ranch. They are housed in one long house. This house is possibly more elaborate than the average poultry man could afford and possibly just as good results would be obtained in a house which cost somewhat less. The fact, however, that a house of this kind is used is the best evidence that everything in connection with the plant will be just as exact and just as near right as possible.

The proprietor of the Sweet Briar Ranch is W. H. Westfall. Mr. Westfall came here from the East some years ago. He was president of a railroad and brought to the business here the same careful methods which had brought him success in his administration of railroad affairs. For a period of three years he has made his hens produce an average of 160 eggs per year. This is exceptionally good for a flock average. Of course there is attention given to all details from raising the chicks which are to become layers to marketing the eggs.

With the high cost of poultry feeds probably most poultry men will be more interested in the ration which is fed. This is as follows: Grain, one-third wheat, one-third milo, one-third barley. The hens consume 4 pounds each, or 1.6 ounces per day. A mash is fed composed of 65 pounds bran, 25 pounds shorts, 15 pounds oil meal, 20 pounds corn meal, 15 pounds ground oats, and 20 pounds meat scraps. This is fed dry in hoppers. The hens consume 2.4 pounds of this mash each month, or 1.3 ounces daily.

I have estimated that the cost of this at current prices for feed is three-fifths of a cent per day for each hen. This does not include any green feed, as the hens here have the run of the ten acre farm or such part of it as they need.

Mr. Westfall was one of the pioneers of the Salt River Valley in the production of guaranteed eggs. About five years ago he made arrangements with one of the local dealers to furnish him with eggs stamped and carrying a guarantee of quality. These eggs have sold at five to ten cents a dozen above the market price for unstamped eggs and the demand has increased until this same dealer has induced a number of others to furnish him with stamped guaranteed eggs.

Close attention to details, the feeding of the carefully compounded ration, which is well balanced, and producing eggs which have sold above the market price, are the methods which have made this poultry farm successful.

POULTRYMAN'S CALENDAR—APRIL, IN THE WEANING COOP

By the first of April chicks hatched between the middle of January and the middle of February are ready for the weaning coop. If they have been properly brooded they are already accustomed to doing without heat. In the weaning coop they learn to roost. Males and females are separated and put on a different ration, the males being given a fattening mash which will prepare them for market and the pullets being put on a laying or near-laying ration.

To teach chicks to roost, put them underneath the roosts, on a thick bed of straw or in boxes. After a few nights you will find them on the roosts. In up-to-the-minute brooder houses the chicks sleep first on the floor and then gradually learn to find their places on the roosts above them.

A good fattening ration for the cockerels consists of 2 pounds corn meal, 1 pound bran, 1 pound ground barley, moistened, if possible with buttermilk or sour milk. If the milk is not available, moisten with water two or three times a day, and feed cracked corn for the scratch grain.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, March 1, 1920. Report for the week ending February 27.

The seventeentb week of the laying contest at Storrs developed the keenest competition of the year, or since the time the contest was started last November. Not only this, but the winning pen for the week, ten White Wyandottes entered by Harry D. Emmons from Plymouth, Connecticut, made the highest weekly record of the year with a yield of 51 eggs. Three pens of three different varieties from three different states tied for second place. Tbese were Oneck Farm's Barred Rocks from Westhampton Beach, Long Island; W. H. Bassett's White Rocks from Cheshire, Connecticut, and A. E. Hampton's Black Leghorns from Pittsfield, New Jersey. All three pens laid 48 eggs each. Four pens from four different states and representing three different breeds, all tied for third place.

The total yield for all pens amounted to 3,504 eggs, which is a gain of 309 as compared with the preceding week and 349 better than the five year average for this period. This is a yield of 50 per cent, which means that the 1,000 hens in the contest av-

The BLASTER says=

"I use GIANT It gets them out cleaner"

Professional blasters know explosives. They have tried all the different makes. Many of them say "Giant gets the stumps out cleaner." John Zurr of Santa Rosa, Cal., writes:

"From the beginning of the time I have been using powder for stump blasting and other agricultural work, I have found the powder made by The Giant Powder Co. to be the most satisfactory. Each certain percentage of Giant Powder is exactly what it is represented to be."

Tell your dealer you want the genuine Giant Farm Powders—Giant Stumping or Eureka Stumping. The Giant trademark on every box is your sure protection against imitations.

It will pay you to write today for our book, "Better Farming with Giant Farm Powders." It tells scores of money-saving ways of doing farm jobs—land clearing, ditching, tree planting, etc.

Sick Baby Chicks?

There is only one way to deal with baby chicks and that is to keep them well. Doctoring a hundred or more chicks is mighty discouraging work.

It's pure carelessness to lose more than 10 per cent of chicks, from hatching to full growth. Many lose 40 per cent to 60 per cent, and even more. No profit in that.

Our book, "Care of Baby Chicks" (free) and a package of Germozone is the best chick insurance. WITH BABY CHICKS YOU MUST PREVENT SICKNESS—NOT ATTEMPT TO CURE. "I never had a sick chick all last season"—C. O. Petrain, Moline, Ill. "Not a case of white diarrhoea in three years"—Ralph Wurst, Erie, Pa. "Have 800 chicks now 5 weeks old and not a single case of bowel trouble"—Mrs. Wm. Christiana, Olive Ridge, New York. "Two weeks after we started last spring we were a mighty discouraged pair. Every day from three to six chicks dead. A neighbor put us next to Germozone and we are now sure if we had had it at the start we would not have lost a single chick"—Wm. E. Shepherd, Scranton, Pa.

GERMOZONE is a wonder worker for chicks, chickens, pigeons, cats, dogs, rabbits or other pet or domestic stock. It is preventive as well as curative, which is ten times better. It is used most extensively for roup, bowel trouble, snuffles, gleet, canker, swelled head, sore head, sores, wounds, loss of fur or feathers. **25c, 75c, $1.50 pkgs. at dealers or postpaid.**

Miscellaneous

A. L. Anderson (R. I. Whites), 556; H. P. Cloyes (Buff Orpingtons), 517; A. E. Hampton (Black Leghorns), 411.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

The fourth month of the contest at Santa Cruz ended on the evening of Monday, March 15. During this month, which covered a period of 29 days, the flock as a whole laid a fraction under 59 per cent. G. G. Barker of Santa Cruz won for the month, his ten hens establishing a new record for the contest with a percentage of 73 for the 29 days. A close second to this was the record of Warren Wood's pen, also of Santa Cruz, with a percentage of 72. The average consumption of food per hen for the month was: Grain, 3.34 pounds; mash, 3.31 pounds; greens, 3.48 pounds.

Leading pen records: Barker, 211 eggs; Wood, 210; Walls, 205; Bellows, 205; Amsbaugh, 204; Binney, 202; Enterprise, 201.

Bellows Bros. of Lakeside had the highest hen for the month with a record of 26 eggs. For the four months, a period of 121 days, hen number 16, belonging to D. B. Walls of Petaluma, laid 106 eggs, or a percentage of 87½ per cent. By the month No. 16 has laid: First month (30 days), 25 eggs; second month (31 days), 28; third month (31 days), 28; fourth month 29 days), 25.

The leading pens to date are as follows: Walls, 754 eggs; Neef, 671; Enterprise, 665; Rose, 659.

Highest individuals at the end of the fourth month: Walls, 106 eggs; Walls, 92; Enterprise, 90; Peck, 88; Barker, 88; Gibson, 87; Walls, 87; Bellows, 85; Webb, 85; Hale, 85.

During the past week, ending March 20, a new seven day record was made for the contest by G. G. Barker's pen, his hens laying an even 80 per cent. High pens for the week were: Barker, 56 eggs; Bellows, 55; Binney, 53; Walls, 53; Enterprise, 53; Bandini, 51; Wood, 51; Gibson, 50; Amsbaugh, 50; Wilson, 50.

POULTRYMEN'S BANQUET

B. R. Holloway of the Holly Hatchery entertained the Van Nuys chamber of commerce, members of the Los Angeles County farm bureau, representatives of various newspapers and agricultural magazines and prominent poultrymen of Van Nuys and San Gabriel at a banquet in the dining room of the Van Nuys high school on Wednesday evening, March 10. Fifty thousand laying hens were represented, including the 26,000 breeding hens whose eggs are used by the Holly Hatchery.

RICE

The California market generally remains practically level, although there are a few lots available slighty under the market. Export inquiries continue to come into the market. The trade firmly believes that the next two weeks will see large orders being consummated.

BEANS

Jobbing price per cwt.: Small white, 6.20@6.25; large white, 6.00@6.35; cranberry, 6.90@7.00; red Mexican, 7.75@8.25; pink, 6.20@6.35; California Bayo, 9.00@9.25; blackeye, 7.10@7.25; red kidney, 13.00@13.35; lima, 11.00@11.25; Garvanza, 9.00@9.50; Kotenashis (in bond), old crop, 5.25; new crop, 5.75.

Dried Peas—California, 5.25@5.40 per cental for green, recleaned.

HOPS

1919 crop, 70@85c per lb.; older growth, 45@55 per lb.; prices to growers for 1920 crop, 50@60 per lb.

GRAIN

Wheat: The prices are based upon Federal grades and standards at the terminals in San Francisco bay and Los Angeles and are as follows per bushel of 60 pounds:

Hard White—	Per Bus.	Per Cen.
No. 1	$2.20	$3.63 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	$2.18	$2.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51½
Club and Sonora—		
No. 1	$2.16	$3.00
No. 2	2.13	3.55
No. 3	2.00	3.48½

The above are minimum prices.

For sacked grain add 4½ cents per bushel to the above prices. Deduction of three-fourths of a pound made for weight of standard grain bags. Wheat grading under No. 3 mixed or smutty wheat will be purchased according to merit.

Oats: Red feed, 3.15@3.25.

Corn: California yellow 3.10@3.15 per cental; Egyptian white 3.50@3.65; milo maize 3.00@3.10.

HAY

Under date of March 27, Scott-Magner & Miller says:

Receipts past week 1,118 tons, mostly cheat from Oregon and No. 1 alfalfa from Nevada. The present weather conditions have been most favorable all over the state for growing crops, therefore, it will not be long before our new crop hay will be available. It is reported that cutting of first crop alfalfa will start in some sections as soon as the weather settles. The entire country reports plenty of grass and the demand from country districts, which was very heavy a few weeks ago, is practically nothing. Feeders in San Francisco are cleaning up their barns before buying any further supplies, which naturally makes trade in the city extremely dull. It is predicted that a few showers during April will give us one of the largest crops we have had in years, both of grain and hay.

We quote today wholesale prices in carload lots as appear from dealer's transfers upon the hay market in San Francisco, for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat hay (light 5 wire bales)	38.00@41.00
No. 1 Wheat or Wheat and Oat hay	35.00@38.00
No. 2 Wheat or Wheat and Oat hay	33.00@35.00
Choice Tame Oat hay	37.00@40.00
Other Tame Oat hay	33.00@37.00
Wild Oat hay	Nominal
Barley hay	Nominal
Alfalfa hay	32.00@37.00
Stock hay	29.00@32.00
Oregon Cheat and Oat mixed	29.00@32.00
No. 1 Barley straw, bale	70@1.00

Citrus Markets

Los Angeles, March 31, 1920

Florida shipments are rapidly decreasing. This has opened the way for keener demand for Californias. There are only about 2,500 to 3,000 cars of Navels left in California. Valencias are beginning to go forward especially from Central California points. They are being quoted around $5 f. o. b. basis.

Lemon prices are not satisfactory though first class stock is commanding fair return. There are 165,000 boxes of foreigns in sight within the next 30 days.

Shipments

Shipments of citrus fruit to date from Southern California since November 1, 1919: Oranges, 12,522 cars; lemons, 2,488; total 15,010. To same date last season: Oranges, 12,874; lemons, 3,152; total, 16,026. From Central California this season: Oranges, 3,566; lemons, 276; total, 3,842. To same date last season: Oranges, 2,274; lemons, 251; total, 3,525. From Northern California this season: Oranges, 260; lemons, 20; total, 280. To same date last season: Oranges, 234.

MARKET NOTES

The market for California cabbage has held stiff during the past week owing to a car shortage in Texas. Usually at this season the crop from that state seriously interferes with marketing the California crop and as the car situation has been relieved a heavy drop in prices may be expected.

There is such eastern demand for lettuce that for the first time in several weeks New York has quoted Imperial Valley lettuce at $5 a crate and prices are expected to hold good to end of season about April 15. Peas still continue in good supply with an advance of one cent over last week. 350 crates of summer squash arrived from Imperial Valley on Tuesday, the second shipment to the local market. Witloof or Dutch celery, forced from roots of chicory, first appears this week.

Always Popular

A well known northwestern ranchman, addressing a livestock meeting in March, said: "We have heard a lot of so-called experts say that there is no such thing as a dual purpose cow but everyone knows that the Shorthorn cow that carries a liberal flesh covering and gives a liberal flow of milk is the most profitable and most popular cow on the farms and ranches of this country."

Looking through a western herd an observer noted several cows ranging from 1800 to 1900 lbs. in weight, big, fleshy, beefy cows, yet their milk records range from 8000 to 12,000 lbs. per year each.

Shorthorn steers continually top the leading beef markets.

Prince Walker Cornucopia

Popular and Productive Holsteins

Founded upon breeding of the most popular blood lines of the breed, backed by foremost production, and carrying a high degree of type, our herd of registered Holsteins offers most desirable selection to the intending purchaser.
The herd of females, including a large number of daughters of Prince Gelsche Walker out of high record dams, is headed by PRINCE WALKER CORNUCOPIA, by Prince Gelsche Walker and out of Alba Sadie Cornucopia Creetia, with over 36 lbs. butter in 7 days and 866.28 pounds butter from 18849.4 pounds milk in 338 days.

Some of his young sons out of good record dams are now offered for sale.

Poland Chinas---The Big Type

Our registered Poland China females include daughters of such high class big type boars as Mac's Big Price, Big Bone Jumbo, and Suberba, the world's champion boar, and are headed by QUALITY BOB, grand champion at Wisconsin State Fair and rated by many judges as one of the outstanding boars of the breed.

The first litters by QUALITY BOB are now coming on, and buyers should make early reservations.

Visit the Rancho or write your wants. You will receive prompt and courteous attention in either event.

POULTRY QUERIES

(Continued from Page 597.)

birds have access to it constantly and an additional meal three times a week of what the author calls "dainties," i. e., millet, hemp secd, buckwheat, Canada peas, kafir and barley. A liberal supply of Canada peas and hemp seed, he says, is necessary to good egg production. The other grains may be mixed with them according to availability and convenience. The "dainties" are fed by throwing them on the floor of the squab house by hand and are thrown in by handfuls as long as the birds will eat. All the grain fed must be old, hard, dry and sweet. Ground oyster shell should be kept in a box in the house, and the ground of the flying pen should be covered with gravel or sharp sand.

Prolapse of Oviduct

I have lost several White Leghorn hens with rupture. First the eggs they lay are a little bloody, then a part of their insides comes out. Can you tell me the cause and how to prevent it?—Subscriber, San Martin.

This is not rupture, but prolapse of the oviduct. The fundamental cause is a weakness in the oviduct walls and ligaments. The immediate cause may be either straining to lay a very large egg, straining to lay when there is an obstruction in the oviduct, or constipation. If the portion of the oviduct which protrudes when the condition of the hen is discoverd has been pecked at by the other birds or has become infected from other causes there is nothing to be done but to kill the hen. If the prolapse or eversion is discovered in time, give an enema of warm, soapy water, if the hen is constipated, and follow with a dose of one-fourth teaspoon of Epsom salts. Wash the protruding mass of tissue with a warm bichloride solution (one tablet to pint of water), then grease with vaseline. With greased fingers try to replace the protruding mass. This must be done with great care and gentleness. When the parts are back in approximately their normal position, insert a lump of ice and keep it there for several hours, in order that the ligaments may not relax. Keep the hen in a small, darkened coop, where she will be as quiet as possible for a few days, and feed a light ration with plenty of green.

It is usually young birds that are laying heavily that are affected in this way. It may be necessary, if many such cases occur, to make the ration a little less forcing for a time.

How Soon Fertile?

I have a goose that began laying before she was mated. How soon after mating will the eggs be fertile? —Subscriber, Orange.

Experiments have shown that eggs may be fertile within a week after mating, but it is safer to wait till two weeks after mating before beginning to have hatching eggs.

White Diarrhoea

Kindly let me know the cure and prevention of white diarrhoea in chickens.—Subscriber, Chino.

If you have really white diarrhoea in your flock, there is not much you can do, for it is a bacterial disease and comes in or on the egg from the hen that laid it. If, which is much more likely, your chicks have ordinary diarrhoea from chilling or overheating or too early feeding, the first thing to do is to remove the cause and the second is to feed sour milk or buttermilk in as large quantities as possible. Keep it before them in fountains and moisten their mash occasionally with it. I am satisfied that 99 out of 100 cases of diarrhoea come from chilling the first four days, and the first and most important part of the treatment is to put the chicks where they will be amply warm. Then feed the sour milk, taking care that there is ample opportunity for exercise—but remember, warmth comes first.

May Be Tuberculosis

My hens go very lame in one or both legs. They eat fairly well, but become poor and weak and sit around on the ground most of the time. Their sleeping quarters are dry. Their ration consists of boiled barley, bran, middlings, alfalfa meal, meat meal and charcoal made into a warm mash in the morning, with cracked corn, wheat, milo and Surelay the rest of the day. They have free range.—Subscriber, Calpella.

This looks like tuberculosis, but a post mortem is necessary to make sure. If on killing one of the affected birds you find liver, spleen and intestines studded with cheesy, yellowish white nodules, you may be quite sure that it is tuberculosis and that the only thing to do is to kill and bury deep every affected bird. If you find no such nodules you are justified in thinking the trouble is rheumatism, though the latter disease is usually characterized by some swelling or inflammation of joints or legs. If there are such external symptoms, which you do not mention, paint lightly with iodine twice a day till there is improvement.

Wants the Best

A Bakersfield subscriber writes for the names of White Leghorn breeders who trapnest, a request which has come to me several times, and I only wish I knew the names of all California poultrymen who trapnest. This subscriber says: "I would like to get some of the best. I raise S. C. White Leghorns, pure bred Hampshire hogs, and am expecting to start in the spring with a registered Holstein bull. I like the Cultivator and want to get in time the best of stock."

Where Are They?

I have just received a vigorous protest from a subscriber against the not-there-ness of people who write this column for help. Two parties have written the Cultivator of their desire to raise pullets for fall delivery. I thought I was doing a service when I put them in touch with two other parties who wanted pullets, but one letter received no reply at all and the other only the shortest refusal.

The Cultivator is most anxious to help in every way, but it hates to be snubbed when it tries to help, and if a breeder or dealer has disposed of all his stock he may—he should—write and inform the inquirers for his goods.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST AT SANTA CRUZ

By M. A. Kortum.

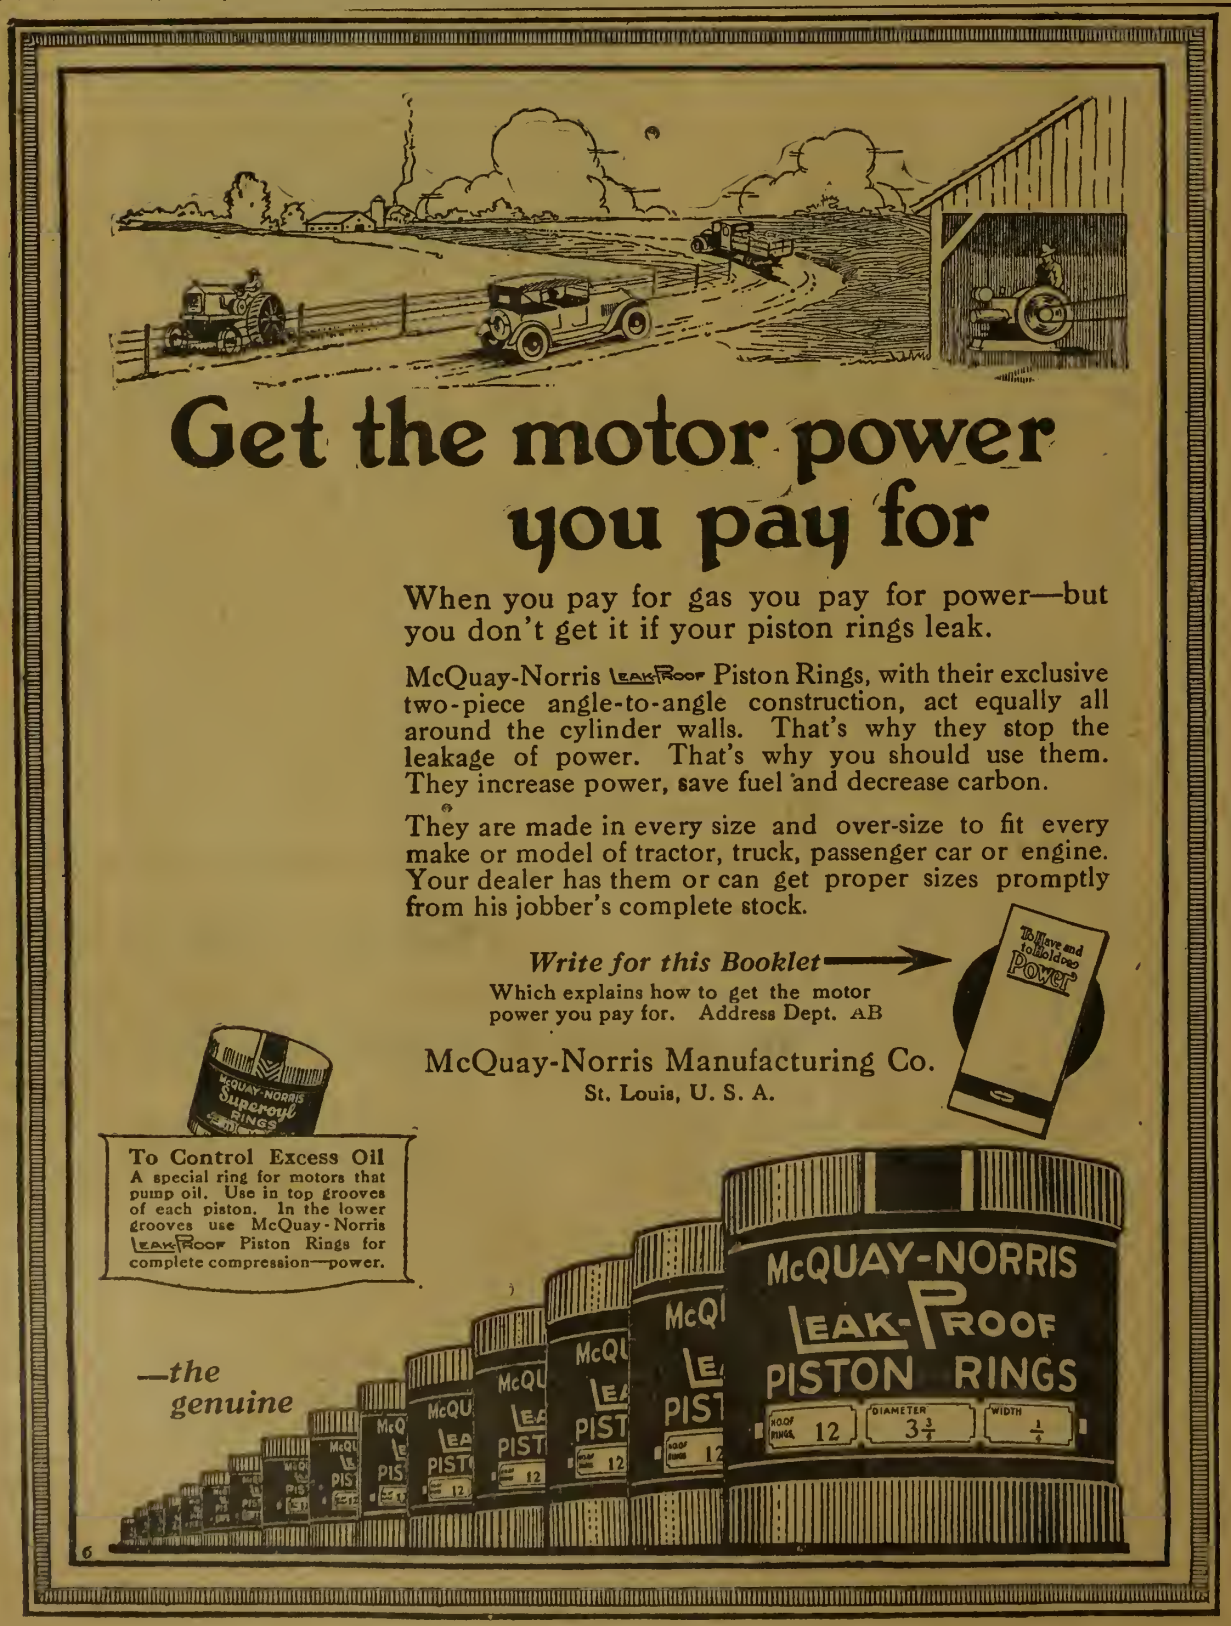
Week ending March 8 showed four running neck and neck, finishing with the same count. Again Santa Cruz took half the honors, with the other half divided between Petaluma and Chino. The high pens for the week are as follows:

Enterprise, 51 eggs; Wood, 51; Walls, 51; Barker, 51; Binney, 50; Webb, 49; Hale, 49; Amsbaugh, 49.

Highest pens to date: Walls, 736 eggs; Neef, 656; Enterprise, 650; Rose 647.

Hens having laid better than 70 per cent to date are: No. 16, Walls, 104 eggs, 87½ per cent; No. 18, Walls, 90 75½ per cent; No. 61, Enterprise, 88, 73½ per cent; No. 272, Peck, 87, 73 per cent; No. 292, Barker, 86, 72 per cent; No. 177, Gibson, 86, 72 per cent; No. 30, Bellows, 85, 71 per cent; No 101, Webb, 84, 70 per cent; No. 238. Hale, 84, 70 per cent.

For the week there were 76 birds that laid over 85 per cent and 216 of the 402 birds in the contest laid over 70 per cent.



Get the motor power you pay for
When you pay for gas you pay for power—but you don't get it if your piston rings leak.
McQuay-Norris LEAK-PROOF Piston Rings, with their exclusive two-piece angle-to-angle construction, act equally all around the cylinder walls. That's why they stop the leakage of power. That's why you should use them. They increase power, save fuel and decrease carbon.
They are made in every size and over-size to fit every make or model of tractor, truck, passenger car or engine. Your dealer has them or can get proper sizes promptly from his jobber's complete stock.

THE MEANING OF EASTER

The meaning of Easter, children?
I will tell yon if I can;
'Tis the heart of God in the spring time,
Appealing to good in man.

And down through all the ages,
Back farther than we can know,
The springtime resurrection
Has carried this message, I trow.

The meaning, at first half hidden,
Is coming on surer wing:
The night of truth has a morning,
The winter of error, a spring.

And anew shall each springtime's glory
This beautiful lesson impart,
That truly the heart of the Easter
Is Easter in each human heart.
—Belle M. Perry.

HOUSE BRIGHTENING

By M. R. O., Hollister

Dear Householders:

Spring brings us so many new joys and by no means least among them is the "house brightening" that our homes may be more truly homey.

Our home is in a five room bungalow. Our spring inventory showed stained woodwork, walls a bit dingy and in much need of new paint, curtains anything but "springy" looking, therefore, resolved we to go over the whole house and give a springtime touch at minimum cost.

We found a good coat of varnish was all the woodwork needed.

The living and dining room floors received a wider varnished border around rug space. One bedroom floor was painted a light tan. The bathroom and other bedroom a light gray, and kitchen floor a darker gray. Experience has taught us that only the "best" of floor paint is economy, and it must be well applied and allowed full time in which to dry before using.

The walls next engaged our thought. Because of the inexpensiveness, ease of applying and its being so sanitary, we chose Alabastine. For living room, dining room and one bedroom a soft creamy tan was used on walls and a little lighter shade for the ceilings.

In bath and the other bedroom we used a delicate blue, and for the kitchen a light shade of green. In each room we put a fainter shade for the ceiling. If you home makers do not know Alabastine, for your own convenience of time and means you'd do well to try it. If at any time by accident a bit is scaled off, we go over the spot with a small brush and a little of the Alabastine mixed with cold water and as soon as dry one could never tell there had been a mar. It is especially good in homes where babies and small children play about, for the walls are ofttimes marred, but can be so easily made new.

Of course the usual cleaning of rugs and brightening up of furniture was necessary. We used dampened salt freely on living and dining room rugs, sweeping and dusting very thoroughly. Some of the furniture needed varnish and some only the regular polish.

The curtains are usually a problem of much interest in the cleaning and changing of the house.

The living room and one bedroom had curtains of good quality scrim. These I washed in warm suds, rinsed in water having added to it two teaspoons gum arabic for each curtain. The curtains retain their crisp newness by this means. They were then stretched on a curtain frame and when dry looked like new.

The heavier winter draperies gave way to ones of pongee. These are lovely and soft and with a brown stenciled pattern were rich and beautiful.

The dining room windows were curtained with tan cotton crepe having inexpensive ball trimmings. These crepe curtains are dainty, serviceable and easily laundered.

A crash table runner on library table in living room was given same brown stencil design as pongee draperies.

The couch in dining room had three large soft cushions, covers made from a tan crash skirt, linen duster (long since unused) and one of tan burlap. The crash and linen ones were given brown hems and a touch of color added with some bright novelty braids. The burlap received a stencil design of pine needles and cones and was fringed on the ends. These cushions can be used freely anywhere and by all members of the family. We want our home to be a usable one; it must combine good taste and utility.

In summer time part of our family occupy out of door sleeping rooms, so we decided to make bedroom off the dining room into our guest room, choosing a soft tan and yellow as our color scheme.

The scrim curtains before mentioned were beautified by adding a band border of yellow flowered cretonne hung "Dutch" style, the valance of the same yellow flowered cretonne. A runner for the dresser was also of the cretonne and a cushion on the rocker. A soft, dainty summer comfort was covered by using four bleached and laundered sugar sacks. these being set together by bands of the cretonne, one running full length through center and one crosswise center, and a border around the finished comfort. It was tied with mercerized cotton thread in yellow and white.

We cut, sewed, dyed and rolled carpet rag balls, carried to the rugmaker, and as a result had a number of pretty rugs, one a tan and white, another of brown with a touch of green. These were placed in this guest room. A little of summer's golden sunshine was reflected in this cool, inviting, restful room.

The other bedroom was in blue and white. Sugar sacks were again utilized on the five windows, two to each. These being broad, short windows, a blue stencil design was used and very nice curtains resulted.

The furniture, dresser, bed and chairs of white enamel were touched up with a new coat of enamel. A bedspread was made from a larger cretonne square, washed and dyed a delft blue (it was formerly used for a big doorway in another house). The two rugs in this room were from the rug makers, one delft blue and white, the other navy blue and green.

The kitchen is a woman's home during many hours of the day, at least some days. The color on walls, light

A SONG FOR EASTER

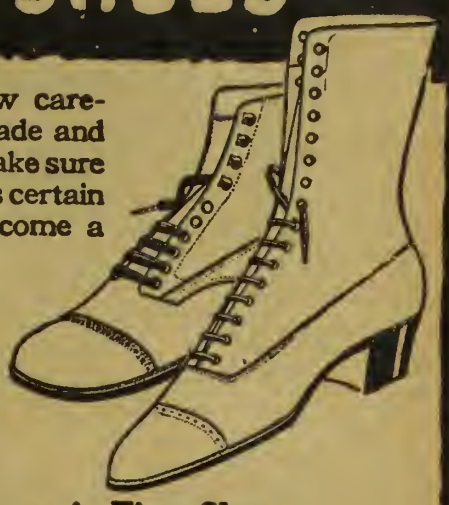
Let all earth's good arise today
And fill the world with sweetness;
Let all earth's wrong unbidden lie
In dust of death's completeness.

Soft falling rains have called the flowers,
The tomb's rock door is riven,
And all the happy springtime hours
Are singing unto heaven.

They must have had enchanting dreams
Down in their hidden places:
The leaves, the grass, the little streams,
To wake with such glad faces.
—E. T. Tompkins.

Mayer
MILWAUKEE Mayer CUSTOM MADE HONORBILT

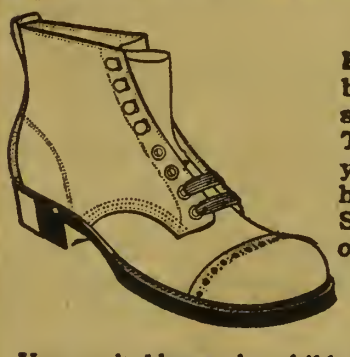
HONORBILT SHOES



IF you only knew how carefully every shoe is made and what steps we take to make sure of unvarying quality, it is certain you would promptly become a wearer and booster for Mayer Honorbilt Shoes. Right now it is essential that your shoe dollars should buy the utmost in value. You can always depend on *Honorbilt* values.

Men's and Women's Fine Shoes

Honorbilt Fine Shoes for men and women can be had in all the very latest styles. Neat and graceful, correct in detail, perfect fitting and comfortable. And the wearing quality never fails. Honorbilt Shoes are built to last.



Work Shoes

Honorbilt Work Shoe leather is double tanned to resist the alkali in the soil, as well as barnyard juices. They are soft and easy on the feet, yet long wearing and will not get hard when wet. Honorbilt Work Shoes will give double the wear of ordinary shoes.

Children's Shoes

You can't blame the children if they scuff out some shoes in a hurry. But that doesn't happen to shoes that bear the Mayer *Honorbilt* trade-mark. They are made of honest leathers and are sound and solid—School Shoes and Fine Shoes—built for comfort for growing feet. *They wear like iron.*

Buy Honorbilt Shoes for your whole family. Leading dealers sell them. Look for the trade-mark on the soles.

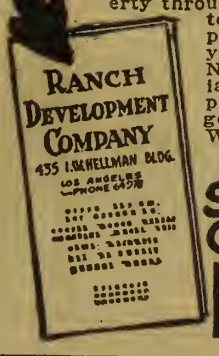
This Folder Tells You How To Make Your Idle Land Earn Money



This is the day and age when you should make every foot of land produce profits for you. If you have any size tract ranging from 80 to 5,000 acres in the Western States that need development you should send for this book at once. It tells you the way to develop your property through the use of Hydro-Electric plants, gravity irrigation systems, pumping plants, grading, and buildings; in fact, it points out the various essentials that are necessary to make your ranch a producing property.

Now is the time to act, so that you can get a crop from your land next year. It is a certainty that crops will bring good prices next year, so take advantage of this condition and get your land under cultivation now.

Write today, stating location of land and number of acres.

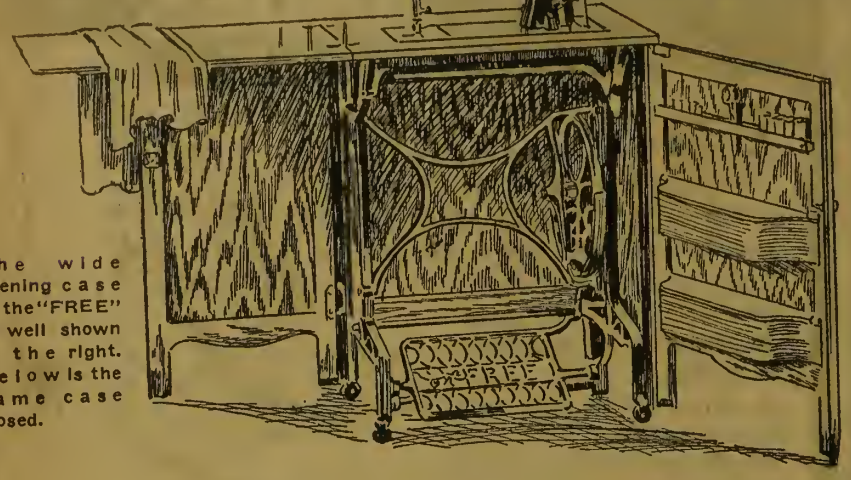
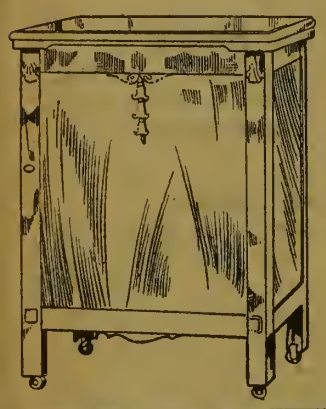
Women Who Do Their Own Sewing Deserve the Help of a Modern Sewing Machine

They should not be compelled to use an out-of-date hard running machine. Family sewing is important. A woman who can do her own sewing saves many dollars a week by her skill. She deserves more than being compelled to "get along" with an ancient machine that taxes nerves and disposition.

THE "FREE" Sewing Machine Guaranteed For Life



The wide opening case of the "FREE" is well shown on the right. Below is the same case closed.



Trade in your old machine on a "FREE."

If you want to know how to get full present value for your old machine applied on the purchase of a "FREE" and enjoy Barker Bros.' convenient payment terms on the balance, write us fully describing the make, age and condition of your machine and we will tell you how you may easily and quickly begin to enjoy sewing on a "FREE."

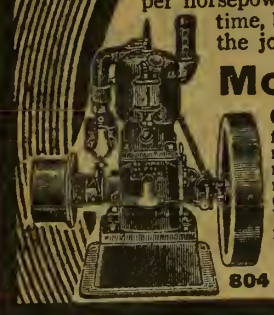
Light Weight Farm Engines

Cushman Engines, recognized everywhere as The Original Light Weight Power, give dependable, economical service on every power job on the farm. Cushman Engines weigh only 40 to 65 pounds per horsepower. The Cushman owner saves valuable time, because he can easily move his engine to the job, instead of hauling the job to the engine.



More Power Per Pound

Cushman Engines weigh only one-third to one-fourth as much as ordinary engines, and they run much more quietly and steadily. Better design, better materials and better workmanship give the Cusbman more power per pound. Equipped with Throttling Governor, Carburetor, Friction Clutch Puliey and Water Circulating Pump without extra charge. Send for Free Book on Light Weight Engines.

green, was used on curtain stencils (sugar sacks), the woodwork being a darker green. We have much light and with the light green it is a restful, cheerful, sunny room.

We put a set of open front shelves in one corner and hung curtains across. This for young "Miss Three Year Old," to put her play pretties in as mamma puts her things in cupboards. Everything in the kitchen is built in except two chairs, a sink stool and small table on rollers. These were all painted to go with kitchen woodwork. This roller table is used to carry foods and dishes from kitchen to dining table, and vice versa. It saves many steps and much time.

One point of much pleasure and change to us is our pictures. We have not yet come to the place financially where we can invest a big sum in real first class water colors and oils for our home decoration, but we do have a good kodak and on our trips here and there we've gathered together a number of good landscapes, now and then a pretty road curve, or a lone tree. For small sums we've had enlargements made and when these are framed in natural wood frames, stained in browns, tans or rich dull green, they are pleasant to the eye and full of memories for us. We change our pictures on the walls, and when spring bids us bring forth the cretonne cushions and the lighter monious with the season. And a few of these pictures have been made more real by the tints from the artist's brush.

From our kitchen we look out upon a full bed of good old fashioned hollyhocks and their cheery faces will be good company on busy days during summer canning and cooking times.

The big front window of the living room looks out upon marigold, golden glow, goldenrod, zinnia and coreopsis beds. These golden yellow flowers carry much of heaven's sunshine into our home, as we always have baskets, bowls and vases of them arranged in our rooms.

I don't know whether or not our editor will consider this worth while, but I'm so anxious to hear from others that I'm sending my epistle in.

My wee daughter and some distance from town keep me in our home many days of the year and we try to make it a really bright home, and do so, partly, at least, by changing the interior with the season's change.

Yours for "Brighter, Better Homes," M. R. O.

P. S. As to stating the exact cost, our Alabastine tints cost an average of $1.25 per room. Good floor paint comes a bit high nowadays, but pays; much of my cretonne I had on hand; the rag rug materials were prepared during long winter days and evenings; the frames for pictures were made from bits of wood in the workshop—really otherwise wasted materials.

The whole family enjoyed taking part in the work, and I am a firm believer in letting the men of the family have a hand in beautifying the home. They enjoy it the more for having had a part, and many have much better taste and judgment of materials, color combinations and the execution of work than women—at least a harmonizing of ideas gives much more pleasing results in the home.

HOW I MADE A NEW KITCHEN

By E. J. T., Stockton

As I happened to be a woman carpenter, perhaps the making of a new kitchen will not interest those who cannot drive a nail straight, but when I was a small youngster I said, "I can do anything that anyone else my age can do," and I kept saying it all through life, and when I wanted a thing done I did it, and so without aid of any kind I made myself a kitchen.

Our house was large. There was a small kitchen, a big dining room and double parlors. Now no farm woman needs two parlors, or living room, as one of them is in these modern times called, so I decided to make a kitchen of the dining room, a laundry and wood room of the little kitchen, it also answering for a storage room for wet coats and wet shoes in winter, things that formerly had cluttered up the kitchen. It was 10 by 11, so was large enough for these purposes. But now to the kitchen:

I bought cheap tongue and groove pine lumber and, with the other pieces

The Cultivator Patterns

BE SURE TO SEND SIZE

3184. Child's Dress. Cut in 4 sizes: 4, 6, 8 and 10 years. A 6 year size will require 3 yards of 36 inch material. Price, 10 cents.

3177-3164. A Stylish Costume. Waist 3177 cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 3164 cut in 7 sizes: 24, 26, 28, 30, 32, 34 and 36 inches waist measure. To make the costume for a Medium size will require 7¾ yards of 38 inch material. The width of skirt at its lower edge is 1¾ yards. Two separate patterns, 10 cents for each pattern.

3186. Girls' Dress. Cut in 4 sizes: 8, 10, 12 and 14 years. A 12 year size will require 3¼ yards of 44 inch material. Price, 10 cents.

3163. A Dainty "Lingerie" Garment. Cut in 4 sizes: Small, 32-34; Medium, 36-38; Large, 40-42; and Extra Large, 44-46 inches bust measure. A medium size will require 5¼ yards of 36 inch material. Price, 10 cents.

2976. A Practical Suit for the Small Boy. Cut in 4 sizes: 3, 4, 5, and 6 years. Size 4 requires 2¼ yards of 44-inch material. Price, 10 cents.

3163. A Pretty Gown. Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Size 38 will require 7⅝ yards of 38 inch material. The width at lower edge of skirt is 1¾ yards. Price, 10 cents.

3170. Junior's Dress. Cut in 3 sizes: 12, 14 and 16 years. Size 16 will require 4¾ yards of 36 inch material. Price, 10 cents.

3160. Ladies' House Dress. Cut in 7 sizes: 36, 38, 40, 42, 44, 46 and 48 inches bust measure. For a Medium size, 6 yards will be required of 36 inch material. The width of the skirt at lower edge is about 2 yards. Price, 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and adreess plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest Chicago styles, all patterns orders are filled in Chicago. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

GARBAGE

needed, already on the farm, I built a cupboard all along an 11 foot wall. But first I took the sink from the kitchen and put it exactly in the center, with a big drain board at the left, and at the left of that I built my cupboard from the floor to the molding on a line with the top of the doors. Then I built a shallow cupboard overhanging. On the other end I built a table with two top drawers and three side drawers and two bins. The bins I took from an old table but built the drawers from parts of new boxes. My cupboard comes over this table too and at the end is closed in by pine boards clear to the floor. I closed it in front of the sink with doors and put in shelves for pots and pans.

I bought hinges, drawer pulls and door catches and before putting them on stained the whole thing a dark walnut, as white soils too easily.

I put in the pipes myself, also, the lead sink drain and the water pipe through the floor, but I did not connect it to the pipes in the yard. I'm going to admit that someone else did that.

I of course put in shelves, just as I could, so there was a place for ev erything. There was, however, one important part I forgot until all was finished, and that was to leave a space in my table for the flour board, but sometime I shall make the drawers shallower and put it over them, as it was in my old table.

I bought Congoleum for the floor and two and a half years ago, the entire job cost $22.75. There was already a place for a stovepipe, so I put in another stove, leaving the old one in the room set apart now for a laundry. I tinted the ceiling of the new dining room and part way down the wall. The balance I papered, using a cream for the ceiling and cream and brown paper for the wall, with an old white molding on the margin, painted brown. This room has a fireplace and two south windows, so it is cozy and light, and everyone remarks upon the convenience of my kitchen.

SUGESTIONS FOR AN EASTER LUNCHEON

Here is a pretty suggestion for Easter favors: From a nest of ferns and flowers have the guests draw colored eggs, to each of which is attached a slip of paper bearing sentiments like these:

Draw the egg of violet hue;
You'll have friends both fond and true.

Pink will bring you luck—
A lover full of pluck.

Gladly take the egg of green,
For good fortune may be seen.

The egg of blue
Means lovers few.

Do not touch the egg of red;
If you do you'll never wed.

If you draw the egg of white,
Your true love you'll see tonight.

You'll marry in another town
If you choose the egg of brown.

These jingles may be written with gold ink, which can be used with an ordinary pen, or the paper may be yellow and the ink of white.

Among the very prettiest of all decorations for a home dinner for Easter, or an Easter Monday party, are crepe paper butterflies, in varied colors, decorated with gold or silver paint or oil colors. Large ones can be made with gilded clothespin bodies, while the dainty small ones have cotton covered wire for foundation bodies and antennae.

Have butterfly candle shades, butterfly place cards and, if possible, a lovely overhead decoration with a number of delicately made paper butterflies fluttering from the ceilings at the end of fine silk strings.

Lovely nut holders may be made (or ordered from a firm making a specialty of novelties) by having small butterflies poised on the rims of the cups which hold the nuts. This is a beautiful decorative scheme especially fitting at this season.

Buy the Best Piano You Can Afford

A good many people start out to buy a Piano with the idea of "how cheap" they can buy. They usually have only one thing in mind—"the price." They are naturally attracted to dealers making "price" the main talking point of their pianos. Pianos are very intricate instruments—the plate and sounding board must be first-class in every respect; there are thousands of little parts which must be accurately made and fitted. Now this "mechanical" part costs, if the Piano is made properly and of good materials. The "tone" of the Piano is still another matter—the art of the manufacturer has endowed the instrument with a "soul," which we speak of usually as the "tone"—this, too, is figured in the cost of the instrument.

Therefore, if the purchaser desires an instrument which is a real piano with a "soul" and not just a piece of furniture, a substantial amount should be invested. Instead of figuring "how cheap," the purchaser should figure "how good" he can afford to buy—for the more money invested at a reliable Piano House, the better the instrument, the longer the service and the greater the satisfaction.

We carry an unusually large line of Pianos in only one quality—dependable quality—but we offer a wide range when graded as to price. As we gladly arrange convenient payment terms, it is remarkable how easy it is to acquire a really good Piano.

We invite you to call at any of our stores—or write us asking for illustrated catalogs and prices.

Cletrac
TANK-TYPE TRACTOR

For Plowing and Discing~the Cletrac

Put a Cletrac to work this Spring. It will replace six to eight horses—do more kinds of work—more days a year—save time and cut costs. It will speed up your plowing and discing—allow you to put more acres under cultivation and produce bigger crops.

The Cletrac used alone or in "fleets" is the right size and type for almost every ranch—the one tractor adapted to all conditions.

No difference how soft and slippery the soil is—the Cletrac travels lightly over the surface on its own endless track without sinking in or packing. It is light, surefooted and powerful. The Cletrac "gets" all the corners also, because it can turn short. Swings back to the furrow quickly, without loss of time or power.

In the orchard, too, the Cletrac is at home. Low hung, with no projections, it weaves in and out among trees without injury to them. Use it to move your spray about.

And remember the Cletrac operates perfectly on kerosene, distillate or "gas".

Write today for that interesting booklet, "Selecting Your Tractor"—it's free.

The Basin of the Colorado River

By C. B. Messenger

OCCASIONALLY a California farmer has been so fortunate as to make a purchase of orchard, alfalfa, cotton or other lands and recover the entire purchase price with the first year's crops. "A combination of circumstances" is usually given as the explanation, or, simply, "good luck." More correctly, it is because of a shrewdness in observing and taking advantage of opportunity, combined with much hard work. When America acquired Alaska, also when she acquired the great territory of the Northwest, in which was also included some of the Southwest, she acquired holdings which every year are doing vastly better than the occasional farm referred to. The minerals of Arizona alone pay annually sufficient to cover lands acquired west of the Rockies.

Now come the engineers and other experts, together with the seers who see things nationally and they point to the rich valleys in the Colorado River basin, and more particularly to the "liquid gold" flowing into the Gulf of California annually, and say to us: "Hold back the floods, put these waters on the rich valleys, and the products of the 6,000,000 acres will every year more than pay for the cost of this great work. In addition, there will be developed 2,000,000 horsepower for use in our industries. Homes for millions will be made possible. Opportunity will be given for birth of a new Americanism, or, more correctly, rebirth of the old Americanism, the spirit of the pioneers."

In addition to new lands developed, new homes made possible, the lands now reclaimed along the Colorado, nearly 2,000,000 acres, will be saved from the ever present menace of mid-summer floods from the melting snows of the Rockies. These lands lie in Mexico and in the seven states up to Wyoming. In the entire basin 15 per cent of the tillable land is in Mexico, 15 in Wyoming, 11 in Utah, 18 in Colorado, 2 in New Mexico, 1 in Nevada, 13 in Arizona, 25 in California.

But why the renewal of this discussion which has been before the people of the Southwest for scores of years? Simply because it remains discussion. Excepting in isolated cases, nothing has been done to reclaim this great wealth. There is still being carried into the waters of the Gulf of California yearly 114,000 acre-feet, or 20,000,000 tons, of rich soil. The wealth giving waters are wasted, the power is not used, homes are not made possible, so there has been brought into being the League of the Southwest.

Its first meeting was held in San Diego in Exposition year. In 1918 a second meeting was held in Tucson, Arizona, but war called for every energy and little more than a series of resolutions resulted. Now comes its third meeting, held last week in Los Angeles. The league is composed of state governors, of representatives of civic bodies, chambers of commerce, boards of supervisors, and other organized units in the seven states or, as expressed in its constitution, the league is: "A non-political alliance between the states of Arizona, California, Colorado, Nevada, New Mexico, Oklahoma, Texas and Utah to foster closer social and commercial relations and to link the communities of the Southwest in a spirit of brotherhood and the promotion of the civic, commercial and social interests of the territory."

In addition, its friends say for it: "It grinds no axes, backs no particular schemes, represents no special interests or factions; it promotes the progress and prosperity of all the Southwest by fostering better acquaintance and intelligent cooperation between the influential and substantial elements of its various communities. Its conventions afford any one community or state opportunity to enlist the unified influence of the entire Southwest to successfully further any legitimate local project or need."

The officers are: President, Dr. R. B. von Kleinsmid, president of the University of Arizona; first vice president, A. L. Richmond, recently president of El Centro chamber of commerce—(Continued on Page 618.)

TO the Wallis owner there is no question that the tractor is a time-saver and a profit-maker. Naturally, his opinion is based upon what his Wallis has done for him; so in his mind there is no doubt.

The Wallis has long championed the principle that the tractor, to serve day after day under the hard strain of heavy farm work, must be built as fine as the best automobile or truck.

Thus you find in it such fundamental principles as the "U" shaped frame; the smooth-running, peppy valve-in-head motor with removable cylinder sleeves and machine-finished combustion chambers; the cut-and-hardened steel gears, completely protected by dust-proof housings and running in a constant bath of clean oil; the oversize bearings, and others.

These things do not cause much concern to the Wallis owner. He congratulates himself on the fact that his Wallis is a dependable worker; that its power is ready day after day; his work done in season; his labor bill reduced and his profits increased.

The trend today is more decidedly than ever toward the Wallis, "America's Foremost Tractor." If you cherish the hope of owning one, it will be decidedly to your advantage to act promptly.

NOTICE: We want the public to know that the
WALLIS TRACTOR
is made by the J. I. CASE PLOW WORKS COMPANY of Racine, Wisconsin, and is NOT the product of any other company with "J. I. CASE" as part of its corporate name.

California Cultivator

Vol. LIV, No. 15 | Los Angeles, April 10, 1920 | One Dollar Yearly

The Goat Dairy Industry

By C. B. Messenger

NOW comes advanced reglstry for Milch goats. I imagine that goats have been the source of food for humans almost as long as have the faithful cows, but Americans have, as a rule, been content to leave this most worthy little animal to southern Europe and western Asia or northern Africa, at least as to commercial production of human food.

More recently, however, the goat has been "tolerated" in this country. This has been especially true of California, for of the great number now producing milk in this country more than 75 per cent are in this state. But even yet in this goat producing section the industry is often likened unto the rabbit boom which flourished in this country many years ago. If there are readers of the Cultivator who have an idea that breeding of goats for milk is but a fad they are surely due to be enlightened. We have no definite figures to show the magnitude of the industry, but a short time spent in looking around a large producing center is sufficient to show literally thousands of these worthy little animals browsing contentedly over hillsides and producing milk which, through auto delivery, is carried to nearly every section of the larger cities. I visited one of these dairies, Vinans' Goatairy, a few days ago and was impressed with the magnitude of the business and the efficiency with which it is conducted.

This dairy has some 200 goats, 91 now milking, but many others due to freshen within a few days. The 91 goats are milked twice daily. The milking is done by two attendants, a man and his wife. As I watched, three or four goats were released from the stanchions and taken to the milking room, this room, not more than ten feet square, having the appearance, with its closed cupboards, of a kitchenette, white enamelled and faultlessly clean. There were two benches of which two of the goats took possession and were promptly groomed, or rather cleansed with moist cloth. The milkers sat down at their sides and in two or three minutes had finished the milking and the two nannies left their places on the benches which were immediately occupied by two more. As the goats were milked, the milk was strained into an ice cream freezer looking container, a tin can inside of a wooden tub, and when this was filled with practically ten gallons of milk a snap was released and the milk ran down the trolley to the bottling house a bit lower down the glen. In this case the milk is delivered to various parts of the city of Los Angeles at a price of 40 cents per quart or 25 cents per pint; other dairymen have sold for 25 per quart or 15 per pint.

This dairy was exclusively of grade goats. California has a large number of pure breds. the foundation stock of which was sent to this country many years before the present quarantine regulations were in force. There are Toggenburgs, Nubians, Saanens, Maltas, and now there is coming an American breed, that is, the American Milch Goat Record Association organized in 1903 is not only registering pure breds but under a different classification is registering grades providing the sire is pure bred.

Youngsters Which Promise Future Production

A bunch of kids of great promise surrounding their owner J. P. McLaughlin. Most of them are pure bred Toggenburgs. A few, however, are grades.

But regarding the advanced registry, here is a note just received from the University of California.

* * *

University Tests Goats for Advanced Registry

Testing Toggenburg goats for an advanced registry for the first goat breeders' association organized in the history of the world, the college of agriculture of the University of California today announced the beginning of a system of authenticated records of milk and butter fat production which will not only focus attention upon the remarkable milk production of goats but will also lead to their improvement through breeding on the same basis as applied to dairy cattle.

The work was carried on under the auspices of the National Toggenburg Breed Association for J. B. McLaughlin of La Crescenta. The results of 24 hour tests follow:

Name of Doe	Milk Pounds	Butterfat Pounds	Avg. % Fat
Polly-Mac	13.8	.442	3.20
Polly Ana	10.2	.421	4.13
Lassie Mac	9.1	.355	3.90

If the production of Polly-Mac be estimated for a period of 30 days, it would amount to 414 pounds milk or approximately 184 quarts for the month. This is at least two-thirds as much milk as a good dairy cow will produce, yet the average goat weighs but one-tenth as much as a common cow.

* * *

"First in the history of the world" looked attractive, so at the first opportunity I proceeded to Mr. McLaughlin's place on the hillsides at the foot of the Sierra Madre. Polly-Mac and Polly Ana were engaged in a lively tilt, for they had just been milked and were well fed. They are both under test, and Mr. McLaughlin remarked that visitors were not in strictly good form inside the goat house when they were under test. However, a peep was permitted. The goats are under a 12 month test and Polly Ana is the first of Polly-Mac's offspring to join in this test. There will soon be a whole flock of Pollys if Polly-Mac continues her last year's record. Inside of 12 months she gave birth to ten kids, five does and five bucks. Three of the little does, as near alike as three peas, were at play in a nearby corral and gave every promise of being as great producers as is their mother with her 13.18 pounds of milk daily. Whether they will, any of them, surpass California Gretel, that wonderful little animal whose production was given in the

(Continued on Page 627.)

Picnic Day at the University Farm

PICNIC Day at the University Farm at Davis has come to be an event of widespread interest to the agricultural communities of the state. For the past 11 years this annual celebration has been enjoyed by thousands of people and this year's Picnic Day, which is scheduled for April 24, promises to surpass all predecessors.

The term "Picnic Day," which has been applied to this annual visitors' day at the farm, is somewhat misleading. While the event has all the features of a picnic or fair, its real purpose is to afford the citizens of the state an opportunity to inspect the institution which they are supporting and which has such a vital influence in the biggest industry of the state. While the institution is always open to the public, this is the one day when all phases of it will be in operation for the special purpose of inspection and demonstration.

The equipment and methods of farm practice which will be displayed are the latest word in scientific agriculture. Many valuable experiments are being carried on continuously, the results of which would be of great value to the farmers in general if they were known. The actual demonstrations and exhibitions are continuous throughout the day and the remainder of the program keeps up a continual series of amusements. The parade is always one of the most spectacular events. The university's prize livestock, which includes some of the best in the state, is entered in this event and each division has a float which depicts some phase of the work being carried on. The student floats, depicting some of the phases of campus life or activity, are always orlginal and interesting. Athletic events not only include intercollegiate games and meets, but also a number of comedy numbers. Large accommodations are provided for dancing and refreshments are served continuously. Speeches of the day are usually made by the governor and the president of the university. It is customary for most of the visitors to bring their own picnic lunches, and coffee and cream are provided.

The first picnic was held in 1909, three years after the purchase of the site, and marked the beginning of the farm's activity. On this day some 5,000 friends of the university gathered to eat lunch under the trees and discuss the future of the farm in California agriculture. This gathering proved very successful and it was decided to have a picnic every spring when those interested in the farm could get together and review the past and make plans for the future. The following fall school instruction was started, but lack of equipment and other difficulties made progress slow at first. The two succeeding picnics were not successful for the farm had little to show and had not as yet learned to show that to advantage. In 1912, however, enough equipment had been installed to prove quite a drawing card, and attendance from then on steadily increased.

When Professor H. E. Van Norman was made dean of the University Farm school in 1913 he made an important step in advancing picnic day. Previously most of the work had been handled by the faculty, but Dean Van Norman realized the value of this type of work for the students and accordingly they were asked to take charge. The student committee which will handle the picnic this year is: General chairman, H. M. Kilburn; entertainment, John Wheeler; publicity, R. A. Davidson; dance, Ernest Phillips; parade, O. W. Karn; transportation, H. J. McLean; reception, Chester Steele; refreshments, G. Hayford; stock judging, J. E. Ditty; decoration, F. Cooper; athletics, O. Huber. The general chairman and the first three men named are students from the university at Berkeley, and the remaining chairmen are farm school men.

The last few years' attendance has been around 16,000 and this year accommodations are being made for 25,000. Last year the day was proclaimed a general holiday in Yolo County in order that everyone might attend.

Agricultural News Notes of the Pacific Coast

Northern California

Hops are selling in Santa Rosa for 62 cents.

The Sacramento retail market is quoting spuds at $9.10 per sack.

The Pacific Rice Growers Association is asking for tariff on Asiatic rice.

Placer County produced last year nearly $5,000,000 worth of deciduous fruits.

Livermore, Alameda County, has promise of establishment of a big dehydration plant.

A campaign is on to raise a fund for building a highway between Nevada and Northern California.

Some almonds have been caught by late frosts and it is feared the crop may be materially reduced.

The state highway commission is taking steps to grow nursery shade trees for use along the highways.

Wine grape growers are generally uniting and preparing for cooperative action in disposing of next season's crop.

Dr. David Barrows, newly appointed president of the University of California, was installed on Charter Day, March 23.

The advisability of installing community dehydrating plants in Napa County is being considered by owners of vineyards.

Work is going forward steadily on outlining plans for forming an irrigation district to take in irrigable lands of Livermore Valley.

Between 50,000 and 75,000 acres of land in Sacramento Valley on which it was expected rice would be grown, has been abandoned for this year.

The state highway commission has advertised for bids for the construction of highway between Red Bluff and the northern boundary of Tehama County.

California papers are full of reports that thousands of sacks of potatoes are rotting in warehouses, the precious spuds being held to force up the market.

Rice experiments directed by the federal department of agriculture at Biggs, Butte County, will be curtailed because of cut in appropriation of the federal department.

The Central California Wool Growers' Association, with headquarters in Alameda County, is the name to be chosen by wool growers who are now engaged in organization.

Horticultural Commissioner Turner, Placer County, in a recent report to the supervisors places the total of fruit and grain crops in Placer County for 1919 at $5,000,000.

Fifty autos carrying about 160 farm advisers and farm bureau delegates are doing Sonoma, Napa, Solano, Sacramento, Placer, Yolo, Sutter, Yuba, Butte, Tehama and Shasta Counties this week.

Ninety power concerns in the state have turned over to the railroad commission complete direction of their systems in order to equitably distribute and conserve power during the coming irrigation season.

Sacramento now has direct steamship service between Europe and New York via San Francisco and the Panama Canal. Through bills of lading will be issued in both directions, goods being transshipped on river steamers.

Central California

Prospects are for a good sorghum crop at Hughson, Stanislaus County.

A. J. Serpa of Stanislaus County was killed by a bull on his ranch near Ceres.

Monday, May 24, is opening day for the Sequoia and General Grant national parks.

The Blossom Festival of the Santa Clara Valley was staged at Saratoga on March 27.

"Control the pest of house flies" has been the slogan of San Joaquin County farm bureaus.

Erection of a $50,000 dehydrating plant for fruits and vegetables is announced for Visalia.

The boys potato club at Shafter, Kern County, has potatoes all planted and growing for the contest.

Superintendent Kreutzer has moved the general offices of the land settlement to Delhi, Merced County.

A number of poultry producers of Santa Cruz have joined the Poultry Producers of Central California.

Patterson, Stanislaus County, proposes August 26, 27 and 28 of the week preceding the state fair as its fair dates.

Tulare shipped during the last year in excess of $250,000 worth of grain, or all told, dairy and other products aggregating $6,125,000.

The Dinuba Grape Growers Association is building additions to its packing houses at North Dinuba, Reedly and Orange Cove.

The California Farm Bureau Federation is mailing to all its members a questionnaire on the Asiatic and Mexican immigration problems.

The Farmers Union at Ceres is inviting locals in the vicinity of of Modesto to unite in the establishment of a cooperative store at Modesto.

Picking of Valencias in the Lindsay and Porterville district of Tulare County is considerably ahead of normal years and 80 per cent crop is reported.

The big cannery at Armona, Kings County, has opened the 1920 season on spinach with force of 125 women and 50 men. It will next operate on apricots.

At the recent conference of rice growers and handlers with the bureau of markets in San Francisco the government recommendation for four grades was indorsed.

The California farm bureau proposes to take up Japanese immigration. Questionnaires will be sent out asking for vote from every member of the federation in the state.

Farm bureau livestock auction sales are announced at McFarland, April 10; Bakersfield, 17; Wasco, May 1; McFarland, 8; Bakersfield, 15; Wasco, June 5; McFarland, 12; Bakersfield, 19.

A general meeting of the Tulare County Water Users' Association is announced to be held in Visalia, April 28. At that time it is expected definite action will be taken for a survey of the county's water resources.

Local meetings of the Kern County farm bureau will be held at Shafter, April 13; McFarland, 14; Beardsley, 15; Weed Patch, 20; Kern Delta, 21; Edison-Fairfax, 23; Court House, 24; Inyo-Kern, 26; Isabella, 27; Wasco, 29.

Southern California

Elsinore Lake is reported rapidly filling up.

Camp Baldy reports a seasonal precipitation of 30.3 inches.

Nuevo, Riverside County, reports apricot trees heavily loaded.

Banning, Riverside County, held its flower show April 8 and 9.

Large plantings of sugar beets are being made in Ventura County.

Palo Verde Valley has pledged 6,000 acres of cotton to the cotton growers association.

Apricots and almonds on low ground at Banning were somewhat injured by recent frosts.

Celery growing has become an important industry in Chula Vista, San Diego County.

E. P. Pierce has been appointed deputy horticultural commissioner in Coachella Valley.

Ranchers in Victor Valley, San Bernardino County, are interested in cotton experiments.

The Palo Verde Cotton Association now has three gins owned and operated by growers.

Heaviest snowfall in years was reported on the San Jacinto mountains the last of March.

Several Southern California apricot orchards are carrying "This is a Sunsweet Orchard" sign.

A big dehydrating plant for grapes is proposed for the Cucamonga district, San Bernardino County.

Simi Valley, Ventura County, made large planting of walnuts and apricots during the past season.

Anaheim Orange and Lemon House has begun on Valencias. It is expected the work will be in full swing by May 1.

Early planted cantaloupes of the Imperial Valley are in bloom and prospects are for carlot shipments by the first of May.

W. C. Wallace has been appointed by the Riverside supervisors to take charge of the drainage system in West Riverside.

The new orange packing house of the Anaheim Cooperative Orange Association will begin packing between April 15 and 20.

The Escondido Progressive Poultry Club is working toward the building up of an industry which can ship eggs by the carload.

Ranchers of the Vista section of San Diego County met recently to discuss the formation of an irrigation district to include 40,000 acres.

The Escondido Poultry Association has organized by the election of Frank Hull as president and Mr. Sorenson as secretary and treasurer.

Considerable interest is manifested in the Escondido Valley in the proposal to form a new irrigation district between Escondido and Oceanside.

The annual meeting of the Riverside County farm bureau will be held at Fairmount Park, April 13 with a picnic lunch at noon and a program of short talks in the afternoon.

The Ventura County Cattlemens Association at its recent meeting at Ventura elected W. H. Hoffman president, Charles Donlon vice president, Gerald Waterhouse secretary, Walter Johnson, treasurer.

The Coast and General

Wenatchee Valley, Washington, has 1,500 cars of apples yet to move.

The Stillaquamish, Washington Cow Testing Association has 500 cows on test.

Pastures in Western Mexico and Southern Arizona continue in good condition.

Two hundred bales of Yuma Valley cotton were sent out last week to Liverpool, England.

Embargo against Australian fruit entering Hawaii has been removed in the case of apple shipments.

Recent rains in Salt River Valley of Arizona have made possible greatly increased planting of alfalfa.

The Washington State Fair Association has $16,000 on hand to use in planning the next state fair.

Storing of eggs began in Portland Oregon, the last of March, buyers paying 32 and 34 cents at country points.

The desert about Yuma is "blooming like a rose." The delicate wild lilies of the desert are brought in by the armful.

A central bureau will be established in Chicago to control refrigerator car service during the coming fruit shipping season.

Wheat growers of Washington are signing up in the great Washington-Idaho-Oregon Wheat Growers Marketing Association.

At the April meeting of the Lewis County, Washington, Holstein-Friesian Club federal testing for tuberculosis will be considered.

Dr. C. D. Marsh of the federal bureau of animal industry is touring Arizona on the lookout for poison forage plants, especially loco.

A great irrigation project is being discussed by Montana people, which would place water on thousands of acres in the valley of the Yellowstone.

Fifty fruit shippers of the Wenatchee District of Washington have pledged their support to proposal for building a new railroad up the Columbia River from Pasco.

During 1919 county breed associations were organized in 12 counties of Oregon. These are all dairy associations organized to encourage the use of pure bred stock.

Gopher control work was conducted during February in the counties of Maricopa, Cochise, Yuma, Santa Cruz, Pima, Pinal, Gila and Graham. The work was done through cooperation of federal and state authorities.

Irrigators near Mesa, Arizona, are clamoring for more teams to aid completion of canal which has been endangered because of so many farmers having withdrawn their teams because of necessary home work.

A group of 50 Finnish poultrymen recently met at Winlock, one of the biggest poultry centers in the state of Washington, and formed an organization to affiliate with the Lewis County and the state cooperative poultry organizations.

The governor of Nevada has named April 6 "Bird and Arbor Day." The proclamation calls for observance of the day by special exercises in the schools. The people of the state are asked to plant trees on this date and to do some act for the preservation of bird life.

Cooperative Management of Citrus Groves

By T. R. Woodbridge Before Citrus Institute

THE groves associated in our project are situated in the Upland-Alta Loma district, about 20 miles west of San Bernardino. The individual holdings are from two to 40 acres, averaging about 12. Therefore it is not feasible for more than a few individuals to own teams, tractors and equipment necessary for satisfactory grove work, and it is the custom for these individual owners to employ labor by the day and hire teams and tractors by the day or season for all classes of work. It is not necessary to more than refer to the common difficulties under this system. There is the uncertainty of what is the proper rate of wages and team and tractor hire, the competition between neighbors in these matters, especially during the spring rush, the aggravating delays, and the annoyance and inefficiency of having a different boss, even if he is the owner, of each small tract.

For a number of years a few of my friends and myself have worked out various more or less promising plans for overcoming our troubles, from including all our properties in a stock company to some form of cooperative operation. Nothing, however, came of our efforts until the war called several of our growers and made us realize that it was up to the stay-at-homes to in some way take care of the groves of those who took war's chances for us. Before our plans were completed the armistice was in force and our neighbors were returning to take up their work. But we had gone so far in our plans that we decided to give them a trial, and out of all this was born what we call the Liberty Groves Operating Corporation.

The Liberty Groves is incorporated under the non-stock, non-profit laws of the state. It has three directors who are given complete control of its business affairs, but who are subject to recall at any time; membership is granted by the vote of the directors; membership is terminated by expulsion by the vote of the directors for reasons sufficient in their judgment, by sale of a member's groves, or by the withdrawal of any member during the last 15 days of any December. Memberships are not transferable and the purchaser of a grove belonging to any member must make an original application if he desires to join. The general idea of these restrictions is that in such an organization it is necessary to have harmonious membership. And putting control of the membership in the directors' hands alone assures us peace even if they have to fight to get it.

Any such expelled or withdrawing member is credited or paid in cash for the interest he may have acquired in the assets of the corporation during his membership. At the end of the fiscal year all charges against each member for the services of the corporation are adjusted on the basis of actual cost and the excess or deficiency between the amount collected and this cost is credited or debited to the member. Each member's interest in the corporation's assets are similarly credited at the end of the year.

Each member upon joining pays into the treasury $15 for each acre in the care of the corporation. These amounts are carried in equal amounts of $5 each as membership fee, capital account and operating account. This makes $10 available for the purchase of equipment and assures the corporation $5 per acre in cash to meet payrolls and current expenses which must be paid before charges can be collected from members.

Other details of the incorporation and by-laws will not be of particular interest. They are all built with the object of being so strictly non-profit, and of determining so easily and definitely the interest of any member that the corporatoin may be even dissolved at any time on a fair and equitable basis.

In studying other ranch organizations we found that most of the successful ones operated a single large tract or a centrally situated larger tract with a few scattering acreages and that they were owned by corporations or by individuals who had other business or family relations.

When the owner desires separate accounts are kept of the cost of operating his groves in such separate acreages as he may specify.

It may be interesting to know that the superintendent, in order to pass by once (not enter) each tract under his care, must travel 16 miles. During a few months of road repair this amounted to 20 miles. This condition of scattered groves caused us considerable anxiety in the beginning, but, as I will show later, was not the bugbear we feared.

These 24 tracts receive their irrigation water from seven different sources, from one corporation furnishing canyon stream water, from four corporation owned wells and from two private wells. We have two tracts which take water from two systems at each irrigation.

The fruit consists of 85 acres of lemons, 205 acres of oranges, five acres of grape fruit, ten acres of olives, with ten acres being cleared for planting. The fruit is marketed through an olive packing corporation, an independent citrus packing house and five packing houses affiliated with the Citrus Fruit Growers Exchange, or seven in all. Our charter specifically states that we cannot engage in the packing or selling of fruit.

A troublesome condition has been our lack of a central location for anything. Scattered over the tract we have three small barns, three tractor housings, three tractor fuel stations, a small tractor repair house, a garage, with no place for larger equipment and tools except that in which they were last used. As we have no housing for our employes they live in the city or wherever they can get board or lodging in the country. This has been a serious matter in our labor situation.

Inasmuch as we were trying an experiment we did not wish to make a heavy initial assessment for the purchase of teams, tractors and equipment necessary for the work. Fortunately the members of our organization owned two teams with equipment, three tractors with few tractor tools, and a small blacksmith outfit. We therefore decided to rent all the equipment available until such time as the Liberty Groves had proven a success. All equipment was first appraised by an outside and universally approved man and the rental was based on the values so given. This rental however covers merely the interest on the investment and a fair depreciation which may be applied to the purchase price later. There were several wagons, team equipment and general ranching tools which were loaned by members to the corporation without rental for the first year in order to speed the affair along.

It has been necessary however to purchase equipment amounting to about $3,000. This includes a few of the larger tractor tools, a brush cutter, a sprayer, a trailer and an automobile. The trailer was made necessary by the state law which prohibits moving tractors over the highways without adequate protection for the road surface, as well as by our feeling that it did the tractor injury to drive it on its own power over the concrete pavements.

Our trailer was a specially designed carrier hung low, and the tractor climbs into it easily on its own power. It is also used in emergencies for fruit hauling, being towed around by automobile. In a larger organization a truck would be necessary, but by buying a strong automobile we have combined the heavy and light service requirements and move tools as well as employes around easily and quickly.

An important feature of the Liberty Groves is that it does not necessarily take over the whole care of any grove. A member is supposed to state in writing at the beginning of each year, or at the time he joins, just the work he desires the corporation to do for him and the manner of doing it. The balance he assumes himself and the corporation takes no responsibility either in advice or work. We have groves where the owner attends to the pruning, the irrigation, etc., or the fruit picking or hauling, or where the matter of the fruit is attended to by a packing house or independent buyer. We have tracts where we are doing only the rock clearing, and we have several tracts where the superintendence and work of every kind is assigned to the Liberty Groves, with almost every condition between these extremes. While the by-laws enable the directors to make a rigid rule in this respect, we have been able to make it elastic, and the custom is to let the member change his working schedule within reason.

A member is charged only for the actual time the laborer, team, tractor, etc., is working on his grove. All adjustments in the field taking more than 15 minutes, all time lost in repairs, all time used in transferring men and equipment from grove to grove, is charged, not to any one or two members, but directly to the general cost of the labor or equipment used, and thus becomes a part of the general expense on which the average charge is based. I referred to the matter of lost time above. During our early planning it was even feared that this would be so large as to disrupt the organization. It seemed to us that this was a crucial point in determining whether isolated groves could successfully combine their working plans. To our surprise and gratification therefore our first year shows that the total cost of moving laborers, teams, tractors and all other equipment, including field adjustments of over 15 minutes, amounted to less than one per cent of the total cost of all operations.

Our system of charges to members probably follows that of other organizations. We render an itemized bill (and it is really itemized) each month showing days and hours for labor, team, tractor, etc., for each day, and for every class of work.

Labor is, however, not charged at the special rate that any certain employe may be receiving on that day, but is based on the average labor charge for the month. That is, the total payroll, including every class of labor from the man who hoes weeds to the team and tractor drivers, is divided by the total number of days of labor to get the average. In this we follow the custom of the Stewart Citrus Association of Upland, and possibly others, who have found it satisfactory. It is true that it works a temporary hardship in some cases, but it averages in the long run and certainly eliminates endless calculations on the monthly charges and, of greater importance, it enables the superintendent to use the labor available where and when he sees fit.

Teams have been charged for at an hourly rate covering the actual operating costs, plus the interest and depreciation (called rental on our books) referred to before. The amount so collected has enabled us to purchase three teams rented from members during the year and so accumulate enough to replace two horses in the case of injury or death.

Tractors

Tractors have similarly been charged for at an hourly rate covering operation costs, interest and depreciation. On the three tractors we have used, appraised at a total of $3,000, our rental collections have been sufficient to pay for half the cost of the tractors. We had planned to cover this item in three years, but an increase in our acreage increased our accumulations accordingly.

Overhead

The determination and proper assessment of overhead is at all times a difficult matter. I have been a member and also a director of several cooperative organizations and know that there is nothing to equal the mention of overhead to get a real live rise out of an annual meeting. For that reason it is not often discussed. In our Liberty Groves, however, we have from the start made a separate charge for this item, explaining what it covered. It seems fair to assume that the members' proportion of the corporation's general expenses is measured by the proportion his monthly bill bears to the total bills of all members. Therefore we adopted the more or less general custom of assessing the members for overhead on this basis. This means that a member who has to pay the Liberty Groves for $100 worth of work during any month shall pay one-half as much of the overhead as that member whose bill for services amounted to $200 for the same period.

We started with 190 acres, have had two sales of properties where the new owners joined the organization, and one sale where the new owner did not join. We started this new year with 300 acres and a resolution by the members authorizing an increase to 375 acres.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

SPIRIT OF THE WEST

No apology is due for the amount of space given this week to a great gathering of great men held in Los Angeles. It was an event worth far more space. For years to come there will be opportunity to talk of the possibilities of reclaimed power and water and wealth from the Colorado. We do believe the event of the last week was one of the most important milestones in this reclamation.

Nor is the Colorado alone in offering opportunities to genuine Western get-together spirit. Flood control of waters of the Sierra Madre and other of the Southern California mountains, the great Pine Flat scheme of the Sierra Nevada, saving the floods of the Tuolumne, the American, the Sacramento, the great Iron Canyon dam, and the pooling of interests of irrigators of the Sacramento Valley all show California standing together to secure greater use of nature's forces and to secure the help of the federal government for these great undertakings.

BONDS COMING DOWN

The patriotic subscriber to the Liberty Bond issues now finds his $100 arôun l the $90 mark, that is, providing he is forced to sell, or, perhaps more often, if he wishes to sell and buy an automobile. In any case they are lower than it was anticipated United States government bonds ever would go. Just why, no one can tell, at least as to all the reasons, for there are a thousand of them. Perhaps the most rapid decline has come since the talk in congress of issuing another $2,000,000,000 to be given to the returned soldiers. However, we have one good suggestion, and that is, if we would all hold our bonds until they mature, their value would soon return to par. There is not a particle of question but that every one of these bonds will command a full 100 cents on the dollar when they mature. It is the height of foolishness to force them off at the big discounts of today.

HARNESS THE COLORADO

In addressing the chamber of commerce of Los Angeles, on his return to California, Franklin K. Lane, former secretary of the interior, touched upon several things of interest to the Pacific Coast, but on none with more force and eloquence than the reclamation in the Colorado River Basin. Here are a few disconnected sentences:

We have, as they have in England, little Englanders and big Englanders, little Americans and big Americans. The big Americans are those who have eyes to see what America can be—what she can be intellectually; what she can be spiritually; what she can be industrially; how she can serve the world best.

We are getting to have a new appraisement of things. Money doesn't seem to be of quite as much consequence as it was. The larger men who deal in large figures look upon themselves with less admiration because of the great sums that they have accumulated and ask themselves constantly—of what use is this money; how can I make it serve better and how can I put to the larger service of my fellowmen the talents that I have?

The thing that tests us all is our value to each other, and California, by that test, and Californians, by that test, loom large in the eye of the nation and in the eye of the world.

We have not yet upon this coast obtained the Pacific sense; the consciousness of the Pacific and of its possibilities. There are hundreds of millions of people who are today just awakening economically, industrially, socially, politically—those people should get their impulse and their impress from us, and we should show forth to them the finer qualities of Christian civilization and make them conscious that this is a land in which Christianity is not merely a commercial system.

I hear that in a part of this state there is a shortage of rain. It should not be vital to us in any way if there is a shortage of rain in one part of the state or another, because the whole community should be independent by reason of the largeness of its resources and our interdependence and our closeness of relationship in transportation. We have just begun to realize that this is a railway age; yes, that it is a steamboat age; yes, that it is an electric age; yes, that it is a gasoline, oil, petroleum age; yes, and that we are not living in Los Angeles alone, but we are living in Java and Alaska and New York and the islands of the sea, and all are bound together and you men of commerce must come up in your vision and appreciate that you are not serving merely the men who lie immediately at your doors, but that you are like those old men who lived in Boston a century ago, who sent their ships across the sea and first started the commerce with the Orient and like those men of Henry VIII's time, who went round the world carrying their flag and giving a conception of our civilization to the peoples of the world.

* * *

We who are in California are rich in vision and we are rich in this; that we can make men see what we see. We have eyes and we can make others see through those eyes and that is what you have done. That is the reason that this land has been subject to some magical transformation; that is the reason why you must make men in Washington see that the Colorado River shall be put to use.

I tell you gentlemen, it takes nothing excepting a little brains, a little money, a little patience, a little persistence, a little faith, and a long time to make Congress see anything.

* * *

We have a reclamation act. We have invested $115,000,000 in the development of Western lands. Last year, the crop from those lands was worth $87,000,000.

* * *

What are you going to do in making Congress realize that there are acres which the world needs brought into service because of the peculiar character of the soil and of the climate and that must lie unused in large part until somebody has the money to combine with the engineering sense to store the water of the grand Colorado, the tributaries of the Colorado down,—and then let those waters out over the land below in California, in Arizona, in Lower California, in such a way as to bring about the greatest result?

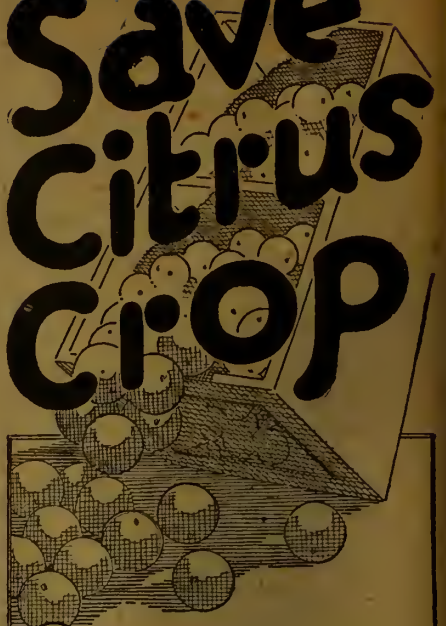
That is not a petty proposition. There is no other one possibility in the United States that will involve as much money. One hundred million dollars ought to be spent in the development of the Colorado River in the next ten years.

SELLING IRRIGATION WATER

The Cultivator recently answered a question as to selling irrigation water in effect that it was necessary for the owner of water to be very careful in making a contract to deliver to his neighbor water for temporary irrigation, otherwise permanency of the water rights might be jeopardized. This brought from Secretary W. R. Williams of the California state railroad commission a letter calling attention to certain exemptions because a "state of war" exists. In addition this is a year of water shortage and the state commission is gathering data which may make available every drop of water to be had. The commission says:

"We would like to be advised of any private wells and pumping plants which may have a greater capacity than is necessary for the irrigation of their owner's lands. In 1917 the legislature, by a special act (Statues 1917, page 281), provided that 'during the time the United States is a party to war or a state of war' and for six months thereafter, the owner of any private irrigation plant or any mutual water company could dispose of any surplus water to others without thereby becoming a public utility. Inasmuch as the United States is still technically 'a party to war,' we believe the above mentioned statute to be in full force and effect and that therefore an arrangement can be made whereby private owners and mutual water companies can materially assist in augmenting the supply of water by the use of surplus water from these private wells. We feel sure that every irrigator is interested in the welfare of the state as a whole and his community in particular and that he will agree to cooperate in the above outlined plan in a public spirited manner."

Save Citrus Crop



Wipe out your enemies—red spider and aphis—with Nico-Sulphur Dust. The most economical and effective method of pest control known to science. Headquarters for high-grade DUSTING MACHINES. Write for free literature.

Growing Greater Mileage On Desert Land

On several thousand acres in the Salt River Valley of Arizona, this company today is producing the finest variety of commercial long-staple cotton in the world.

While this accomplishment is of general interest as beginning the reclamation of an immense agricultural empire, it is primarily important to users of our tires.

Cotton is an indispensable element in modern tire construction; superior cotton enhances the strength, flexibility and endurance of the product it enters.

In converting the immemorial wastes of the desert into fertile and profitable acreage, Goodyear is really growing greater mileage on hitherto abandoned land.

Through every stage of their development Goodyear Cord Tires have benefited by work of such a character as is represented in this Arizona enterprise.

Not one element of their composition, not one principle of their construction, but has been carried steadily forward by invention, experiment and toil.

Today the harvest of such endeavor is seen in the capacity of Goodyear Cord Tires to deliver a kind of performance unapproached in any earlier type of tire.

Because Goodyear Tires and the sincere conservation service behind them afford unmatched satisfaction, more people ride on Goodyear Tires than on any other kind.

This actual photograph shows former desert land in the Salt River Valley of Arizona, now producing the finest variety of commercial long-staple cotton obtainable

The Possibilities of Terracing

By Herbert Burdett

TERRACES have been for centuries the favorite form for citrus groves in Southern Europe, and as the result of local observation and experience they seem likely to become as familiar a feature of the landscape in the citrus belt of California as in those of Italy and Spain. Hillsides hitherto neglected or devoted merely to the production of barley hay are being transformed into very profitable hanging gardens, as the ancients used to call them. Modern scientific methods of citrus culture are being applied to attain results formerly achieved only by the employment of human labor on a scale that today is economically impossible.

Protection from frost damage is the end chiefly sought by the terrace builders. The cost of fighting frost is a heavy charge upon the orchardists of California, amounting to as much as an average of nearly $80 an acre a year, according to C. C. Teague of the Limoneira Ranch at Santa Paula, who has kept careful records of the expense on that typical property during the past six years, which, to put it in another form, amounts to a capitalization of over $1,300 at six per cent. On the other hand, Edwin G. Hart of North Whittier Heights is authority for the statement that by the expenditure of from $10 to $100 an acre in terracing, immunity from frost has been secured, a difference of ten degrees being recorded on the coldest night of the present season, between the higher terraces and the level land less than an eighth of a mile distant.

It has long been recognized by careful observers in this state that the higher lands were comparatively free from frost and many groves have been planted upon slopes with gratifying results in that respect. But the fact that no particular difference was made in the method of planting these earlier groves, whether on level ground or on hillsides, proved often disastrous in other ways. The trees being set in the usual straight rows, up and down the slopes, there was nothing to check washing of soil during heavy rains and even in irrigating it was difficult to avoid some erosion. There were instances where this washing out was so extensive as to expose the roots of trees and practically ruin portions of a grove. Consequently the erroneous conclusion was reached by many observers that hillside planting was not practical.

By the construction of terraces on which the irrigation water flows on a grade of from one to 2½ per cent this danger of washing out has been overcome, as demonstrated at North Whittier Heights. Such terraces as extend beyond 300 to 400 feet are furnished with a second supply pipe at about that distance from the initial flow and the addition of a fresh stream prevents lack of water at any point, while it permits the use of a stream so small as to be under perfect control The rainfall is nearly always absorbed by each terrace but a drain is provided at the end of the terraces to take care of any surplus water, which it leads into the nearest gully or sometimes into a reservoir whence it is again used, as all water for irrigation necessarily is pumped to the summit of each terraced hill.

In Italy and Spain where the terraces were constructed long ago when labor was cheap, stone retaining walls were built, as often the soil was carried and filled in where rocky hillsides were utilized. The cost of this construction would be of course prohibitive here. Plow and scraper and "V" leveler do the work and the earth banks are sown to clover and self seeded with natural grasses and other vegetation which serve to prevent erosion from rain. Some of this growth remains green throughout the year but such of it as dries and ripens is cut or broken down and serves as a mat through which the rain filters gradually into the soil.

Avocado culture is rapidly increasing in popularity and terraces are particularly suitable for these trees. The first terraced avocado grove constructed in this state is at North Whittier Heights and is owned by J. M. Elliott. This was planted six years ago. The avocados are interset with lemons and absolutely no frost injury has occurred to either.

There has lately begun on the west or opposite slope of the Puente Hills at La Habra Heights what will be the most extensive demonstration of terracing in the state. About 100 acres will be terraced and planted this year under the supervision of Edwin G Hart, and it is intended to similarly plant about 500 acres. Another 300 acres will be utilized by Robert L. Reynolds, who has successfully grown winter vegetables on slopes and hillsides for some years past, and who is a convert to the new frost protection system of terracing. Robert M. Teague, citrus nurseryman, has 40 acres at La Habra Heights also, which he intends to terrace and plant to citrus and avocado trees.

Pear Growing

By H. H. Sherrard, Horticultural Commissioner Tuolumne County

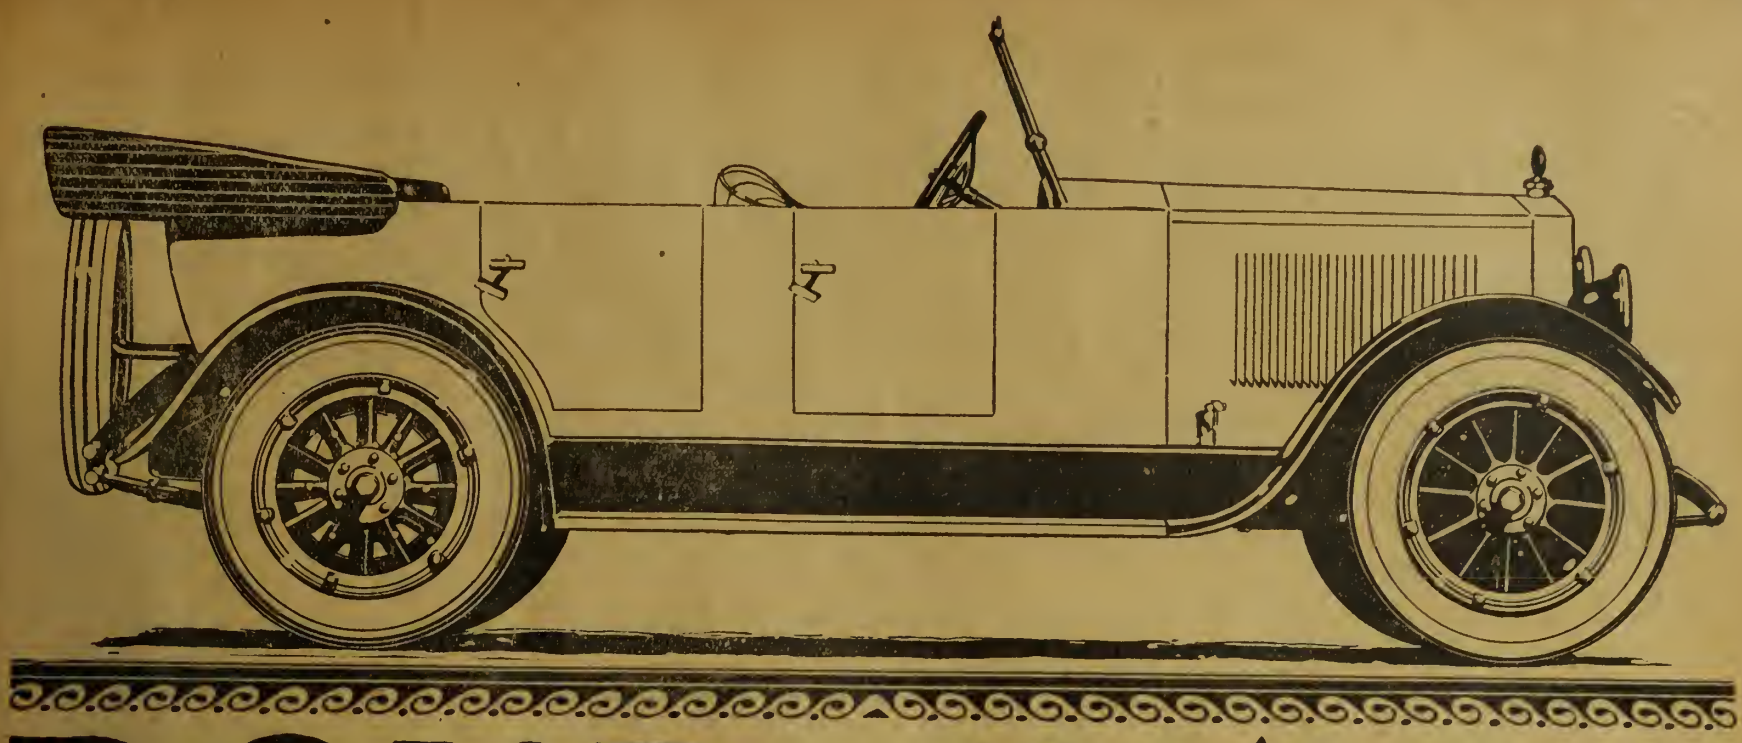
THERE is no greater assurance for the pear industry than the old trees widely scattered in all kinds of soil conditions, topography, and difference in altitude. With little observation along the highways one will notice pear trees of numerous varieties growing on flat wet areas, on the hillsides, on a ridge, in sod, and many of them growing vigorously and producing good yields, and without cultivation, pruning, or spraying. Some of these stand in very wet soil, others in dry soil, and many of the trees are over 50 years old, symmetrical in form and show no deformity as the result of unfavorable weather conditions, diseases, or insects. These trees have battled the elements alone and stand as mighty bulwarks for the future, indications of ability to grow in our county and seeming to beckon to the interested grower "Plant me," "Plant me." There is no better information to be secured as to what variety of fruit will grow in a section of a country than the very trees that are growing there, the conditions under which they are growing, and the results of this growth in health of tree, amount and quality of fruit produced. Some prominent fruit men of this county have stated that they have a yield of nearly 1,500 pounds from individual trees.

Localities and Soil

Some of the largest and best pear orchards in California are situated in the foothill regions. The conditions in Tuolumne County for the pear are ideal. Our deep, dark red clay loams, mixed with decomposed granite and lava, amply supplied with limestone, produce large quantities of the highest qualities of pears. However, pears will grow and produce well in shallow soils over a tight hardpan and under adverse conditions. Apples will not do well on wet or dry land; they will not be long lived and the fruit will be tasteless, but the pear will produce good fruit under both extremes, will even grow well and produce in soils somewhat alkaline.

Propagation and Planting

Pears can be dwarfed successfully by grafting on quince root, the Angier being commonly used. The Bartlett does not make good union with the quince and it is usually customary to double work the quince, first grafting on Beurre Hardy for a length of a foot or more, which makes a good union with quince variety, and then the Bartlett on the Beurre Hardy Some of the most experienced growers of California advocate 14 feet as the best distance between dwarf pear trees, which gives 222 per acre. The cultural advantages of the dwarf are



BOUR-DAVIS
MOTOR CARS

You will like the Bour-Davis at first glance, because few cars have ever approached it in beautiful lines, finish, upholstery, and equipment.

When you first drive it, your enthusiasm will grow. For you will feel the wonderful thrill of driving a big, high-powered car, fit and able to go through under the worst road conditions in the south and west; roads that are impassable to most cars.

But, the most pleasing thing about the Bour-Davis is that your pleasure in it grows the longer you own one, because of its thoro reliability.

The Bour-Davis is built in the south by men who were pioneers in the automobile business and who have made a most careful study of southern and western road conditions, and designed the Bour-Davis to meet them.

On the market for five years, the record of the Bour-Davis is without a blemish. There has never been a poor Bour-Davis built, nor a dissatisfied Bour-Davis owner.

THE CAR ITSELF

Space permits only the briefest description.

The chassis will delight any mechanic—125-inch wheel base; Continental Motor; spring specially designed for southern and western roads; every part the finest money can buy.

The body is a beautiful creation—straight, unbroken lines from front to rear. The body finish and coach work is a masterpiece. Real leather upholstery. And you have a choice of three body colors and four upholstery leathers to express your individual taste. The equipment is exceptional—lined top; tonneau and inspection lamp; thermos bottle compartment that locks; curtains that open and close with the doors, and numerous other features that will surprise you in a car at its price.

Take a ride in a Bour-Davis or drive one and we predict you will be surprised to find that you can satisfy your utmost desires in a motor car for a medium price

Our latest six color catalog will be sent on request

DEALERS
You will find the Bour-Davis an exceptionally profitable selling proposition. Some territory still open. Write for full information.

When writing advertisers, mention the Cultivator.

their ease of pruning, picking and spraying. One man can prune approximately four times as many of these trees and pick three times as much fruit in a day as of the standard pears. Spraying is more thoroughly accomplished. Quince root is nearly immune to root aphis, but more susceptible to oak root fungus.

The standard pears are budded or grafted on pear seedlings, the stock being secured from France and Japan. Dr. W. L. Howard of the University of California recommends Jap or French root as blight resistant for the trunk and top worked to Bartlett so that in case of blight attack the disease will be kept in the branches and be more easily controlled. Twenty to 24 feet apart on the square is usually advised for standards. The holes for planting pears, as well as all other fruits under most conditions, are most economically made and are best for the trees if blasted.

Pruning

The vase form is usual in shaping the pear tree. When the tree is young give careful consideration to the development of scaffold branches. Each individual tree usually presents a different problem and considerable judgment must be exercised. Summer pruning promotes fruiting while winter pruning secures strong wood and prevents overbearing. Thinning out with some shortening in to allow an adequate amount of sunlight are the fundamentals to observe in pear pruning.

Thinning

In case of overbearing after all the natural dropping has ceased, thinning is recommended to improve quality and size. Small and low quality fruit are common on the overloaded trees.

Irrigation

Irrigation must be carried out to some extent in Tuolumne County for pears or the fruit will be small, tough and of poor quality and the tree will be retarded in its growth.

Blight

One of the limiting factors of the pear industry in many sections of California and the United States is blight. Blight is a bacterial disease that develops in the sap tissue of the tree. It gains entrance through the blossom, bruises and tender shoots, the organism passes down the twigs through the branches and into the trunk and sometimes even to the roots. To control prune out the diseased areas when they first appear, using care in keeping tools disinfected and cutting out about 18 inches below the infected and dead parts.

Varieties

The Bartlett is unquestionably the variety for commercial purposes, with Winter Nelis in second place and Seckel a fair variety for the home orchard or special trade. It is usually recommended to plant Bartlett and Winter Nelis together for cross pollination purposes and in the proportion of about eight to one, every third tree in every third row being a Winter Nelis.

Harvesting

Pears should be harvested when the first indication of ripeness is noted. With the Bartlett the first sign of ripeness is a tendency for the stem to separate from the fruit spur when the fruit is slightly raised.

COOPERATIVE MANAGEMENT

(Continued from Page 609.)

Lessons

We have learned several lessons during the first year, a few of which may interest you. We should have housing for employes, and barns and shops for tractors and tools, with plenty of capacity for storing feed and supplies. We believe we will soon come to the plan of letting the superintendent alone decide from his experience on all kinds of ground in our organization what is the best way to disk, plow, cultivate, etc., any individual acreage. Our experiences in buying fertilizer, repair parts and replacements has shown us that we have not been utilizing our opportunities as we might. We can with advantage purchase the larger house supplies such as coal through our corporation. We have had confirmed our idea that a citrus ranch cannot be run by tractors alone. We have learned that operating a tractor on stony ground is doubtful economy. We feel that results have proven the correctness of our first instructions to our superintendent that he bear in mind two important matters: First, service; second, economy.

The members of the Liberty Groves have finished their survey of the first 11 months of operation and have expressed satisfaction with the results, and are convinced that a number of scattered groves totaling 200 to 300 acres can be operated better and cheaper as a whole than under the individual system, even with the unfavorable conditions I have described to you. So thoroughly are they convinced of these matters that at the annual meeting in February they authorized the purchase of another tractor and team and authorized the erection of a house for a married employe, a few bunk houses for bachelor employes and the building of a large barn and general storehouse.

RAISIN DAY

Fresno celebrates Raisin Day on April 30. Plans for the historical pageant which forms a section of the parade in the celebration are reported to be progressing rapidly. The pageant will depict the early days in the San Joaquin Valley. A parade two miles long will be the morning feature of the celebration and over 150,000 are expected in Fresno.

"Mail your friends a Raisin Day postal card from Fresno on Raisin Day" is one of the slogans adopted for the celebration of the day. Postals emblematic of the day are now being printed and will be distributed in the morning as the parade finds its way along the streets by "Sun-Maids" and "Blue Ribbon Peaches" riding a float on which will be the largest mail box in the world, a replica of the package boxes used by the government.

Later in the day the box will be placed in courthouse park in the center of the city and the public will be asked to mail the cards distributed to all their friends. It is planned to make this an annual event and it is expected that a flood of fame will be given to the Raisin Day celebration by this means.

The attendance is expected to exceed 150,000 this year, that number attending the eleventh Raisin Day celebration last year.

There are 75,000 blind throughout the United States and less than a dozen libraries for their use. There are no newspapers. England, with only 35,000 blind, has facilities for printing far superior to ours.

Orchard grafters are the only kind of grafters who don't get into trouble these days.

CATERPILLAR
Reg. U.S. Pat. Off.
LAND LEVELERS
increase land values

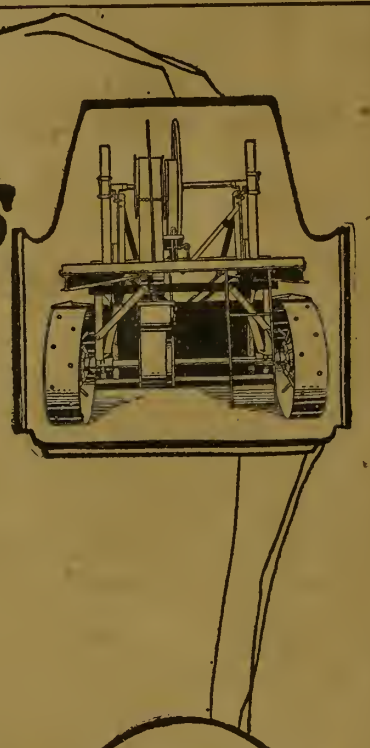
For a few dollars per acre, land once considered unfit for cultivation can be made highly productive. The increased valuation alone pays a big profit on the moderate investment.

Fill the low spots and level the rough stretches of so-called "worthless" land. The "Caterpillar" Land Leveler will do it at the rate of from 15 to 40 acres a day. One man on the tractor, another on the leveler, handle the work. The "Caterpillar" Land Leveler does better work, at less cost, than horses or mules and scrapers, or other tractor equipment. It is simple, strong, easy to operate.

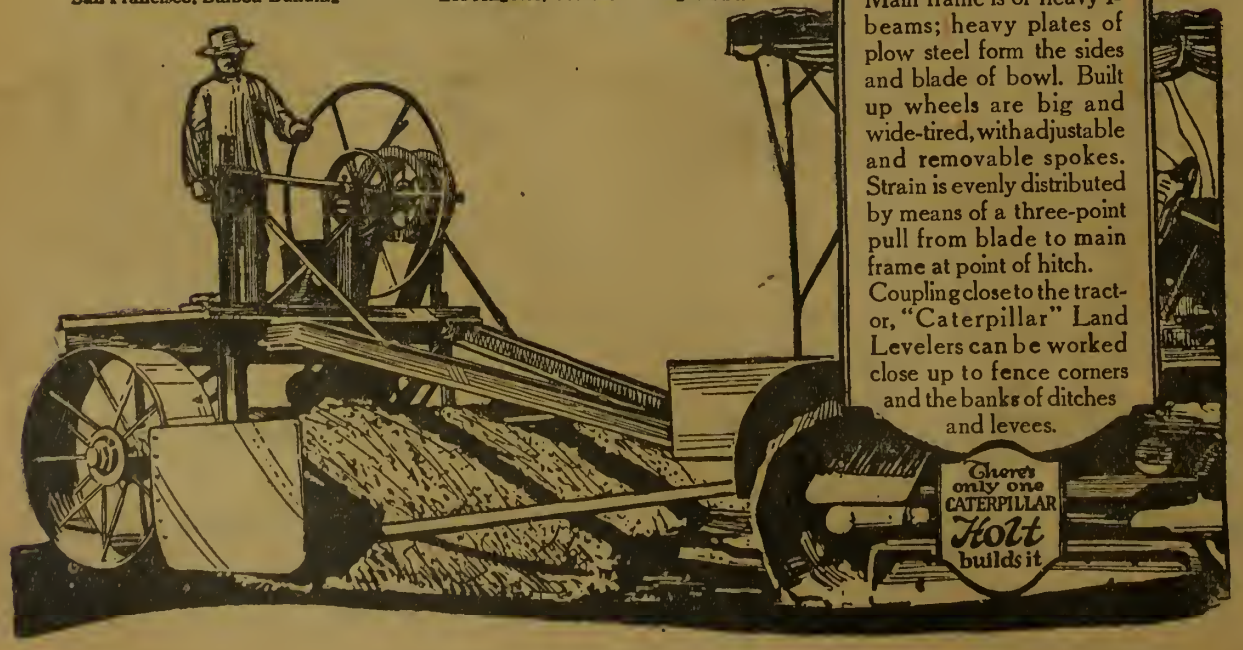
Governments use it for reclamation work, counties for roadwork, and farmers and contractors for every kind and condition of leveling. It carries the dirt as far as wanted, dumps it in a heap, or spreads it thinly or heavily, as desired.

Call no land "impossible" until you have seen our new book on "Caterpillar" Land Levelers. Where shall we send your copy?

THE HOLT MANUFACTURING COMPANY
Representation in every part of the world
STOCKTON, CAL. PEORIA, ILL.
San Francisco, Balboa Building Los Angeles, 117 So. Los Angeles St.



Two sizes of "Caterpillar" Land Levelers are made—8 feet and 11½ feet. The blade is raised by belt driven by pulley on axle. A powerful hand lever applies belt tightener. This lifting mechanism is simple, direct, and impossible to get out of order. A foot brake locks the blade at any height.
Main frame is of heavy I-beams; heavy plates of plow steel form the sides and blade of bowl. Built up wheels are big and wide-tired, with adjustable and removable spokes. Strain is evenly distributed by means of a three-point pull from blade to main frame at point of hitch.
Coupling close to the tractor, "Caterpillar" Land Levelers can be worked close up to fence corners and the banks of ditches and levees.



COOPERATIVE CAPRIFIG ORCHARDS

By G. P. Rixford

THE widespread disaster to the mamme, or over winter, caprifig crop during the past winter in the central part of the San Joaquin Valley and part of the Sacramento Valley should admonish the growers to take precautions to obviate such a calamity in the future. It is not less than a calamity to have the mamme crop wiped out, as the loss of the winter crop means the loss of the profichi, or spring crop, which is the great pollenizer and plays so conspicuous a part in bringing the Smyrna figs to maturity, the failure of which means disaster to thousands of acres devoted to the industry. The great Smyrna fig industry, now well on the way to a prominence scarcely second to the raisin industry, is absolutely dependent on that minute, but beneficent hymenoptera insect commonly called blastophaga.

The insistent demand from great regions for the winter figs from the government orchard at Loomis in the foothill region of Placer County, with which to reestablish the lost colonies, shows how serious the question is to large numbers of growers.

The obvious means to meet the difficulty in the future is for the cultivators of a district to join in planting the best caprifig varieties on a small tract in the citrus belt of the foothill regions along the borders of the great valleys, which is reasonably free from frost. The cooperators in such an enterprise would insure themselves a dependable supply of caprifigs at little expense. Other and later localities could be planted in order to extend the caprifying season.

The following paragraph from United States department of agriculture Bulletin No. 732, is germane to the subject:

"All Smyrna fig growers appreciate the fact that there would be considerable advantage if caprifigs containing the insect could be had for a period of a month or six weeks, thereby insuring the pollenizing of more figs and an increase in the crops. With our present varieties of caprifig trees the caprifying season covers a period of only about three weeks. The only way by which this period can be extended with capri vartieies now cultivated seems to be by planting the capri trees in cool localities where the proximity of the sea or other influences retard the ripening of the figs and the development of the blastophaga. In such localities as Loomis, Fresno, Indio and Mecca, California, and Phoenix, Arizona, the insects from the profichi crop begin to issue from about the 10th to 20th of June, while in localities within the influence of the ocean breezes, such as the cooler portions of Sacramento and San Joaquin Counties, the period of issue is a week or ten days later, and at Niles, Alameda County, California, on the eastern shore of San Francisco Bay, the time of issue is as late as July 25 or the beginning of August. Cooperative caprifig orchards could be so located as to supply the Smyrna fig growers with pollenizing material for the latest figs that could ripen before the advent of the fall rains.

"This would be a desirable undertaking for an association of fig growers, such as was formed at the Fig Institute at Fresno, California, January 4 and 5, 1918."

Any association formed for the purpose will be supplied gratis with cuttings from the best trees in the Loomis orchard, varieties which in that locality have never failed to carry the crop safely through the winter.

SALE OF PUBLIC SCHOOL LANDS

A public auction sale of state school lands in Ventura County will be held at the court house in Ventura, April 19, 1920; the school lands in Santa Barbara County will be offered for sale at the court house in Santa Barbara, April 20, 1920, and the school lands in San Benito County will be offered for sale at the court house in Hollister, April 22, 1920, all sales to commence at ten o'clock A. M.

For lists of lands and information address W. S. Kingsbury, Surveyor General, Sacramento, who reserves the right to reject any and all bids.

TRUCKS AND TRAILERS

Occasionally there was a tractor in the truck and trailer show held in Los Angeles last week, but it had a look as if it felt it was an interloper. It was really a fine showing of trucks, of trailers, of oils, greases, signals, spring lubricators, ball bearings, solid wheels, cushion wheels, all other kinds of wheels, batteries, tires, both solid and pneumatic, wheel cranes, anti-leaks for the radiator, carburetors, various types of bodies, listers and occasionally other farm implements, piston rings, magnetos, and other accessories and equipment for trucks and trailers.

There was a large number of trucks ranging from the small auto made over into a delivery wagon up to the big seven and a half ton powerful machine. The most surprising feature was perhaps the wide range of trailers. These were from the little two-wheel camping outfit up to the big four-wheeler in solid cushion tires, also in pneumatics.

IN CLOSE COMPANIONSHIP

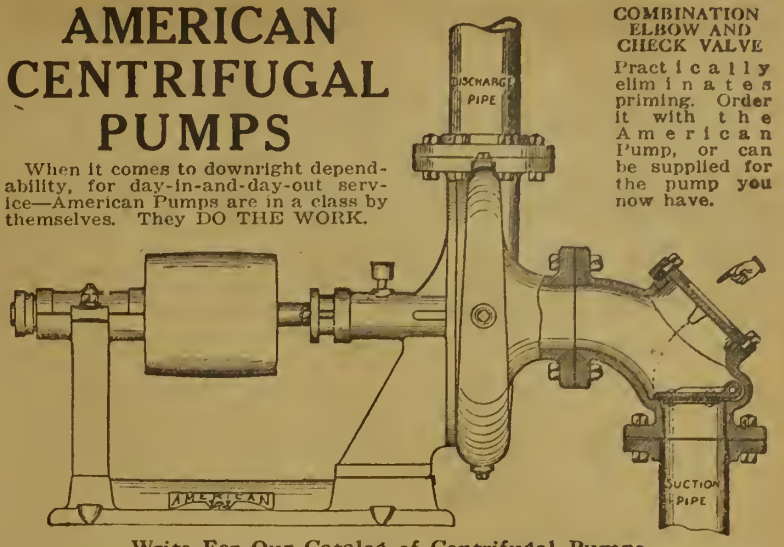
Little Janet's mother had sent her to the corner store to get some fly paper. Janet was a long time in returning, and her mother began to feel anxious. Going to the door, she saw the youngster coming up the street, and called:

"Janet, have you got the fly paper?"

"No, mother," said Janet, "it's got me, but we are coming together."

AMERICAN CENTRIFUGAL PUMPS

When it comes to downright dependability, for day-in-and-day-out service—American Pumps are in a class by themselves. They DO THE WORK.



COMBINATION ELBOW AND CHECK VALVE

Practically eliminates priming. Order it with the American Pump, or can be supplied for the pump you now have.

Write For Our Catalog of Centrifugal Pumps

If your water problems can be solved with any pump—it can be solved with an American. These pumps are designed to meet every possible condition. They get the MOST water at the LEAST cost and with the LEAST TROUBLE. Put your irrigation problems up to irrigation experts. Also write for our Catalogs of Motors, Gas Engines and Oil Engines.

American Pump Co.

73 Fremont St., San Francisco. 425 E. Third St., Dept. B., Los Angeles

Extra parts are always available without delay for standard advertised machinery. This class always found in the California Cultivator.

-but CALCO Metal Grain Bins are Leak-proof

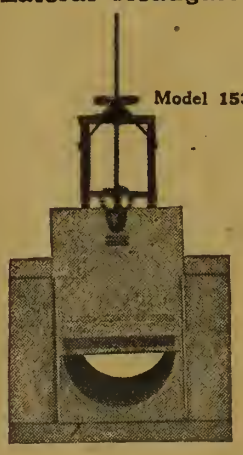
The only way to stop a leak is to plug it.

Calco Grain Bins are plugs; they are designed especially to plug leaks.

They plug the leaks where your grain has been wasting. They plug the leaks in your business. Sacks leak. Squirrels, rats, and mice gnaw holes in them. Every leak means a loss to you that could be avoided. Calco Metal Bins don't leak. Write for the Calco Grain Booklet. It will show you how to save money.

Armco Lateral Headgate

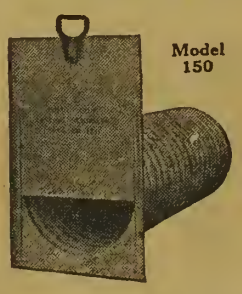
Model 153



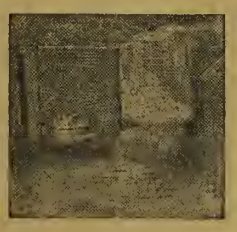
An inlet gate with bulkhead and screw lift. Model 150 is another inlet gate with hand lift.

Armco Lateral Headgate

Model 150

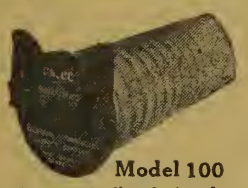


Lyman Irrigation Meter



An accurate, low-cost meter for the measurement of irrigation water.

Calco Automatic Drainage Gate



Model 100

Automatically drains low-lying lands and protects against back flow.

Armco Irrigation Gate

Model 161

Will not dry out, swell, warp, rot or burn. Is easily operated.

Calco Slide Headgate

Model 101

For levee and reservoir use under varying heads of water up to 20 feet.

Speaking of CONCRETE GARAGES

Is your car protected in a weatherproof, fireproof, permanent garage? Is your other property protected because your car is thus housed?

You want a garage like that—one that is reasonable in cost and requires practically no repairs.

You can have it if you use Concrete in any one of several ways. You'll be interested in knowing how a concrete block garage will meet your needs.

Ask for our free booklet "Concrete Block Garages"

Wonderful New Hay Crop
SUDAN GRASS

First Introduced into the U. S. in 1909 from the Sudan in Africa. Tests by the department of agriculture have proved it to be of the greatest value in the Southern and Western states, where rainfall is deficient.

Culture—Sudan Grass is strictly an annual. It may be drilled or broadcasted. If drilled 8 to 12 lbs. per acre is ample; for broadcasting 15 to 25 lbs. should be used. It grows 8 to 10 feet high and yields from 3 to 8 tons per acre. You are sure of two cuttings, and if irrigated three or four cuttings.

Sudan Grass for Pasture—During the months of August, September and October all other grasses are dry, then is the time Sudan is most valuable for fall pasture, and by having it fenced in small fields it will yield food for six times as much stock as any other forage will without irrigation. For milk cows and hogs, there is no better and more abundant pasture than Sudan Grass. It will solve the hay proposition as nothing else can or will do in this climate. A good silage and balanced ration. This seed was grown on our own farm, and is free from Johnson Grass.

Price Per Pound:

10 lb. lots, 25c — 100 lb. lots, 20c
250 lb. lots, 19c — 500 lb. lots, 18c
1000 lb. lots, 17c

Carob, or St. John's Bread

By Ernest Braunton

THE Cultivator recently received a circular from a New York firm of importers offering beans and bean meal from Ceratonia siliqua, known locally as the carob, or St. John's bread tree, one somewhat grown in the warmer parts of California for nearly or quite a half century, for old trees may be found from San Diego to Butte County. The circular says:

"We quote subject to confirmation, for prompt shipment from producing countries, Portugal — Cyprus — Italy, wholo honey locust beans, in bags used especially in making calf meal, stock food, etc., in lots of 20 tons and upward at 4¾ cents per pound, f. o. b. New York, 30 days net, or less one per cent ten days. It requires about three to six weeks for shipments to reach New York after receipt of order. We can also supply powdered honey locust beans, in barrels, ready for use, and would be pleased to submit sample and quote price if interested."

Sounds like big business, but it is a long and expensive journey to bring the product from Spain and Italy when it may be grown in California. It has been stated that the trees are slow of growth and maturity but so far as the writer knows none have been given a chance. Budded nursery trees of superior merit have produced pods the first year, when less than two feet high. This is certainly precocious enough and satisfying to any who wish to make a practical test of the commercial value of these trees.

In Other Lands

The late Aaron Aaronsohn, of the Jewish agricultural experiment station in Palestine, said in that country an acre of these trees on poor dry soil yielded a much greater quantity of food material than an equal area planted to the best alfalfa. He gave a sugar content of 40 per cent and a protein content of seven to eight per cent. The writer has eaten of pods grown in California that analyzed 32 per cent in sugar.

In France, Spain, Portugal, Italy, Algeria and other parts of north Africa and in semitropic climes over all the earth the carob tree is grown for its edible pod for stock food. In times of famine or food shortage large quantities have been eaten by human beings. In those countries tho carob grows in any kind of soil except stiff clays or those too wet, as the tree is unusually drouth resistant. Even in gravel it has returned good crops of beans and in no good soil has it failed to yield a crop commercially profitable.

The Crop

Aaronsohn stated that in Palestine in good years the average tree yielded 450 pounds and he had seen grafted trees yield 1,000 pounds each, with trees still growing. Algiers reports a yield of 660 pounds; Portugal, in fertile soil, 1,650 pounds; and single trees are known in Spain, near Valencia, that bore more than 3,000 pounds Such a crop, at the New York prices quoted, would be worth in the United States $130.

Carob Trees Ten Years Old

They bore good crops of pods after the fifth year and promised well but were removed to make room for a skyscraper.

No harvesting except picking from the ground is necessary for the pods drop when mature. Those adhering will quickly fall if branch is shaken or the pod struck with the tip of a bamboo pole. As the trees are wide spreading and do not grow more than 40 to 50 feet high in the wilds they are easily controlled for we may behead them if found best to keep them branched low. The pods are equal in food value to barley for feeding horses, cattle, sheep and hogs and as the yield is much greater per acre than grain (in mature trees three or four times as great) it is readily seen they should be grown in all countries where it is climatically possible, for few crops will yield an equal value to the stock farmer.

In California

Records show that the United States imported seeds of the carob from Spain in 1854 and from Palestine in 1859. It is thought some of the seeds were sent to California as a few very old trees are known. These range as far north as Napa and Butte Counties. In 1911 the first budwood of the six best fruiting varieties was imported by the United States from Valencia, Spain. This was sent to the plant introduction gardens at Chico and is being widely distributed Aside from these buds the best of the seedlings in the state, probably of equal value, have been drawn upon for buds, so that there is no lack of trees of the best fruiting types. A large proportion of tho seedling trees, planted for decorative purposes, are valueless as food producers.

The trees are usually grown from

seeds, which are easily procurable, and the seedlings budded to approved varieties. Trees bearing seeds are not uncommon in many parts of the state and quite generally distributed over the southern third. Nurserymen having propagating plants have grown them from cuttings, but heat is needed. The seeds should be soaked in water for three days before planting. The trees do not transplant well with bare roots so all should be balled. The young trees are first grown in boxes or nurserymen's trays and treated same as eucalyptus, being cut out with little squares of earth for planting in pots, boxes or field. The trees grow rather slowly for the first few years and no doubt should be set 40 feet apart and interset with faster growing fruit trees. As stated, at first few trees have been given good care and soil but these few have made good growth. Heavy frosts injure them so that they should not be indiscriminately planted throughout California. There is no good reason why the pods should not be grown and used as elsewhere. They are exported from the countries mentioned by thousands of tons annually, much going to England for stock food and in Malta and other island possessions the meal is the chief food of horses belonging to the British army. Even in California the meal has been mixed with flour and used for bread, cakes, etc., and is highly regarded by those who have eaten of them.

STORAGE SCALD

A. W. Tate Jr., Watsonville district apple inspector, office of standardization, department of agriculture, is the authority for the following interesting information:

"Recently the manager of a local cold storage plant asked an opinion in regard to a certain lot of apples which showed a large percentage of 'storage scalds.' A shipper had stored apples in both the local plants. In one no scald developed; in the other a large percentage occurred.

"I examined lots from each plant, packed the same date and from the same portions of the orchard. The conditions were identical, and the investigation revealed plainly that the fruit from the irrigated section of the orchard showed no injury, while the apples from the light, shallow and dry soil did.

"This bears out the following conclusions from scores of inspections of cold storage fruit: Apples from light soils, or shallow soils overlying clay, in other words deficient in moisture; fruit prematurely ripened due to this soil condition, or from trees injured by rodents or other causes almost invariably are more easily infected by 'storage scald,' whereas fruit from irrigated light or heavy soils where, by thorough cultivation, the moisture has been retained, are practically immune."—S. V. C.

EUCALYPTUS A NUISANCE

A case of unusual interest has just been decided wherein eucalypt trees on a lot in South Pasadena, Los Angeles County, standing near the line of an adjoining lot, have been adjudged a nuisance in that the roots impoverished the soil of the adjoining lot. The trees were ordered cut down at once. The case has attracted wldespread interest because it is the first of its kind. After a description of the two properties involved, the decision reads:

"It having been found that the defendant maintains upon his said two lots seven eucalyptus trees of the blue gum variety, all of said trees standing near the said land of the plaintiff, and that all of said trees send roots into the soil of the plaintiff's said lot, and that some of them bear branches which overhang plaintiff's said lot, and it having been found as a fact that said branches and said roots constitute a nuisance in so far as said roots penetrate into the soil of plaintiff's said lot, and in so far as said branches overhang her said lot, and it having been found as a conclusion of law that the plaintiff is entitled to a decree requiring the defendant to abate the said nuisance, it is ordered, adjudged and decreed that the said nuisance shall be abated by the defendant within —— days from the entry of this decree. It is further adjudged and decreed that said abatement shall be permanent in its nature, and that the operations required therefore shall be carried out upon the land of the defendant and not upon the land of the plaintiff, and it is further adjudged that the plaintiff have judgment for costs in the sum of $——, to be taxed. Dated this 24th day of March, 1920. (Signed) L. H. Valentine, Judge of the Superior Court."

FOREST FIRE PROHIBITION IN DRY SEASON

Unanimously on record in favor of keeping all fires out of forests during the dry season, a joint committee appointed by several of the organizations most interested in the preservation of California forests to study the problems of forest first protection has announced its object of formulating a protective system that will, at minimum expense, prevent material loss to mature timber, and also result in a minimum of damage to the productive capacity of forest soil.

Initial activities of the committee will be to analyze and weigh all existing evidence on the following questions: Effect of fire on mature and young timber and on its rate of growth; value of advance reproduction in the forest; damage to timber by insects and the effect of fire thereon; cost of protective measures.

Donald Bruce, associate professor of forestry in the University of California, has been appointed chairman of the committee.

COLORING THE CASABA

Growers of casaba melons have striven for years to improve them, until we have several excellent types, all sports from or selections of the original type. Some years ago the flavor was pronounced perfect, the flesh of good color and texture, and the cavity and number of seeds reduced to a minimum. It then became a question if further improvement was possible. Then some grower noticed a little yellow tinge in the outer rind and this was encouraged until it became quite distinct as an underlay of yellow or imperfectly suffused background or foundation of yellow.

Then a Downey rancher teased the yellow "into the open" and held it fast. The result is a casaba with every good point of the other varieties and a golden color most appealing to the eye, proclaiming the rare qualities to be expected within. Other growers have reported the rind as being a little bit harder than that of the others, therefore a better shipper and keeper. Those watching market sales also noticed that the rich color sold off this variety before the others on the market were taken. So that now the golden hybrid is no doubt to be the leading variety grown in the future, unless someone shall still further improve it, which hardly seems probable. —E. B.

Value of the farm crops for Maricopa County, Arizona, last year was more than $35,000,000. The value of the crops in 1910, according to the United States census, was $2,545,000. The land under irrigation in 1900 was 118,230 acres and at the present time it is approximately 300,000.

Do You Know—

STANDARD PRACTICE

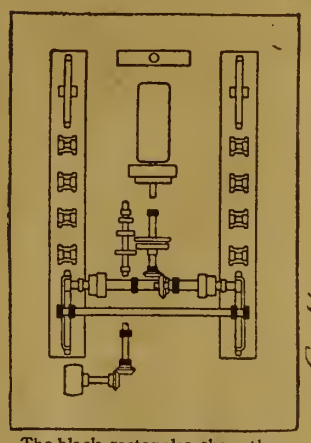
The use of Timken Tapered Roller Bearings at points of hard service in the great majority of leading tractors—and in power-driven farm machinery—is proof of leadership established on the tapered principle of design, quality of manufacture, performance, and service to the automotive industry.

that only an adjustable tapered roller bearing can keep tractor gears from wearing out prematurely?

that Timken Tapered Roller Bearings at points of hard service keep working parts in proper alignment continuously, decrease repair bills and increase the life of the tractor?

that the tapered roller bearing—the Timken type—is the type of bearing that will function properly under radial load, or thrust load, and all possible combinations of the two?

that Timken Bearings can easily be taken up should wear develop after a long period of service, and be made as good as new?



The black rectangles show the locat ons of the Timken Tapered Roller Bearings in the Best Tractor, manufactured by C. L. Best Gas Traction Co., San Leandro, Calif.

Hay met a good call from local feed dealers and shippers at former prices prevailed

Is Your Hay Part of the 10%

Only 10% of the hay Grades "Choice"

IN nearly every instance, hay that grades poor would have been "choice" or No. 1, if cured in accordance with the Dain System of air-curing hay. This system requires no extra hay tools—you simply use, instead of some other rake, a

JOHN DEERE

DAIN SYSTEM RAKE

The Rake With The Inclined Frame

With this rake you can follow the mower, rake while the leaves are still active, and place the hay on clean stubble in medium-size, loose windrows, the bulk of the leaves inside and the stems outside.

The Dain System rake does this the most successfully because it is the rake with the inclined frame. The frame is low at the front end and increases in height toward the rear—its capacity increases as the volume of hay increases. The frame being low at the front end and set slightly ahead of the tooth bars causes the hay to come up against the frame and pitch forward into a loose windrow, placing the leaves inside and the stems outside; most of the moisture evaporates with no loss of leaves or foliage.

With the Dain System Rake you can preserve the loose windrow until the hay is ready to store or bale, even though it may be necessary to turn the hay over two or three times on account of bad weather conditions.

Free Book "John Deere-Dain System Rake" describes this system of making better hay. Write us today, addressing John Deere, Moline, Ill., and ask for Booklet DS 47.

CONVENTION NOTES

President Von Kleinsmid is an ideal presiding officer. The discussions were pushed along with pep and a clear voice gave information to many who were unable to hear all some some of the speakers did endeavor to convey.

* * *

One of the great events of the convention was the address of William J. Bryan at the closing session. Mr. Bryan said that for once he had had the satisfaction of sitting and listening to men who knew what they wanted to say. He defined the greatest of orators as one who knows entirely his subject and honestly presents it. Mr. Bryan showed himself the orator under his own definition, for he spoke honestly of many of the things he had learned during the three days of conferences. One of the things he learned was that there is possible opportunity in this great development of the Colorado Basin for the exhibition of selfishness, but he gave warning to those who would exploit the American people and get undue advantages that the American people would be watching and waiting for opportunity to punish. Let the issue be clearly drawn between the pioneer and the profiteer. "I am for the pioneer."

* * *

It did not matter, perhaps, whether these lands were developed for the benefit of the state or the nation; but it did materially matter whether they were developed for the benefit of all the people.

* * *

Mr. Bryan suggested that the only campaign of education which could be conducted to convince the East of the wonderful possibilities and the great benefit to the nation of developing these lands was practically bringing the East out to see with its own eyes. The wonderful production of cotton, the best cotton in the world, of alfalfa, of livestock, of rice, of mid-winter garden truck, and many other necessities, could not be told convincingly at long range, but a trip of the Easterner along the road on one side of which is cactus, snakes and sage, on the other wealth producing crops, would show him.

* * *

"The same water which grows the cotton will furnish the power to turn the spindles and run the looms to make the cotton fit for human use. This would save to the Southwest the lands now desert; it would save in transportation and all other costs." It was asserted that if these waters which are going to waste annually could be controlled so as to be used for hydro-electric power, in addition to their use for irrigation purposes, there would be developed 2,000,000 horsepower for running the looms and the factories of the country. One enthusiastic listener understood it to be 100,000,000 horse power. It's immaterial, however, for it is as impossible for most of us to imagine the full import of 2,000,000 horsepower as of 100,000,000.

* * *

There are now being irrigated by the waters of the Colorado slightly over 2,000,000 acres of rich lands. One speaker suggested the cost of the reclamation as $80,000,000, another, $100,000,000, and another remarked that even if it should be a quarter of a billion one year of full crops would pay the entire cost.

* * *

President Seiberling of the Goodyear Rubber Company referred to the wonderful quality of the Pima cotton of Arizona and incidentally referred to agricultural possibilities under irrigation by stating that the cost of the great Roosevelt dam is now covered four times annually in the products of the Salt River Valley.

* * *

"Boll weevil has driven Sea Island cotton into the sea; the finest long staple cotton found anywhere in the world is the Pima cotton now grown in Arizona and California."

* * *

On Friday there was rivalry between speakers as to who could introduce the greatest number of puns, quips and stories to enliven their otherwise serious talks, with Governor Campbell of Arizona and Vice President McCormick of the Southern Pacific railway about equal. But William Jennings Bryan was called for while the audience awaited the coming of Helen Taft, and told the following story:

"When Joe Blackburn of Kentuck

was running for congress he heard that a hanging was to take place at a county seat in his district and as he knew the sheriff he made the trip, hoping to catch an audience. The sheriff recognized him in the crowd and invited him to a seat on the scaffold with the priest, doctor, etc. The prisoner was to be hanged at 10 o'clock but as arrangements got ahead of the program the sheriff told the prisoner he had five or more minutes if he wished to say anything to the crowd. As he replied in the negative Joe jumped to his feet, asked for the intervening time and launched a plea for his election. In about two minutes the prisoner turned to the sheriff and said: 'Sheriff, if it's all the same to you, I'd like to be hung now and let this fellow talk after I'm gone.'"

* * *

No talk of the day met with more response as it progressed than that of Dr. Elwood Mead, who explained that while others were outlining great schemes for reclamation and irrigation he wished to present the human side of the question—placing the settler on the land, and under conditions that reasonably assured success. It was evident from the close attention paid and the hearty approbation manifest that he had suggested a new and valuable line of action.

* * *

Joseph Simons, president of the Imperial Valley Landowners Association, asked the support of the league in seeking official creation of a neutral zone helow the border for the benefit of water users. He complimented the Mexican government on the favors extended and the able manner in which during the war they had guarded our water canals below the line. But when a canal breaks or other mishap occurs too much red tape has to be unwound and rewound before one may get across the international boundary to make repairs, etc. So his organization asks a neutral zone, for water interests only, to remove this heavy handicap to quick action in times of canal trouble.

The Resolutions

"The Convention of the League of the Southwest, composed of delegates from the States of California, Colorado, Arizona, New Mexico, Nevada, Utah, Wyoming and Idaho, in conjunction with engineers. scientists and men eminent in the affairs of the whole nation, assembled in the city of Los Angeles, Cal., April 1, 2 and 3, 1920, view the plan of control and development of the Colorado River, as outlined by the Reclamation Service of the United States and the able papers presented to this convention, as one most essential to the growth and development of the West, and as furnishing means for the future prosperity of a great many citizens of the United States of this and future generations. The vastness of the project is such, that many years will be required before it can be brought to completion in all its details.

"Whereas, it has been shown by the investigations of the government that a great dam may be constructed at or near Boulder Canyon on the Colorado River, as proposed by ex-Secretary Lane, adequate to control the destructive floods of the Colorado River and of sufficient capacity to supply water for the irrigation of 1,500,000 acres of land in addition to that now under irrigation, with a productive capacity of $150,000,000 in wealth annually, with a livelihood for over 1,000,000 of our population;

"And whereas, the power available from this reservoir will be sufficient to supply the necessary electrical energy for large portions of the states of California, Utah, Nevada, Colorado and Arizona;

"And whereas, the storage of water at this site will not in any way interfere with the further development of the river in the upper portions of its drainage basin;

"Now therefore be it resolved; That the United States Reclamation Service be requested and urged to proceed with diligence with its investigations of this site, with a view to its very prompt construction;

"Resolved: That Congress is hereby requested to appropriate the sum of $50,000 for the use of the Reclamation Service in completing the investigation of the Boulder Canyon reservoir site, and that such appropriation be made available at once;

"And whereas, the withdrawal from

(Continued on Page 623.)

"I never wrote an ad—but I've used one of your outfits a year—so here goes"

"Unfair, you may say, for a farmer like me to write an advertisement on Western Electric Power and Light Outfits when I already have one. But is it unfair if I tell the truth? You may disagree with my ideas, but I am not asking you to buy a Western Electric if you do not believe in it. I'll go further and say don't buy any plant until you have seen them all. That's what I did."

John Horning

Mr. Horning is a farmer near Maiden Rock, Wis.

Too much talk about "light;" how about power?

"In my case it was several weeks before I realized that in the pulley on my outfit I had a work-horse that was as valuable by day as the light was at night. Now I am convinced that without enough engine capacity to take care of power and battery charging at the same time, a farmer is cheated out of a money saving that means heaps.

"Of course, I know there are other plants with pulleys, but I do not know whether their engines can take care of an extra load or not. Maybe they can—they should. I do know that I got more engine with my plant than some of my neighbors.

But will the engine do the work?

"A big husky engine, like a mule, is no good if it balks. Now I want to say that my engine is dependable. Of course, all valve in head, 4-cycle engines are powerful — that's been proved.

"Nor must I fail to give my engine credit for starting when I want it to start, even in the coldest weather—and it keeps on running too. In fact, I can hear it right now. But if it depended on me to watch the oil level like a cat watches a sparrow, I'm afraid I'd be in trouble most of the time. I'm too busy. With my engine all I need do is fill the oil reservoir about once in two or three months. Then as long as there is even an inch or two of oil in the crank case, there's enough for the revolving crank to splash over every moving part.

"Then there's another thing that means sure death to a set of bearings—starting too soon on kerosene. I made that mistake once with another engine I had. Result was the kerosene seeped down into the oil reservoir, thinned my lubrication, and pretty soon bang! went the bearings. Now this present engine, though it burns kerosene, starts on gas—about a cupful is needed—and keeps running on gas that gradually changes to a mixture of gas and kerosene, which finally becomes all kerosene when the engine is hot enough to burn it up. I haven't had any bearing or lubricating troubles all this time and I don't look for any.

I don't know enough about a generator to talk about it.

"I am going to say off the generator question. I don't believe the average farmer knows enough about a generator anyhow to talk about it. I took my generator on faith. I understand that these people have been making generators for about 30 years, which is longer than I have been farming. I think I know something about farming and I should imagine that they know something about generators.

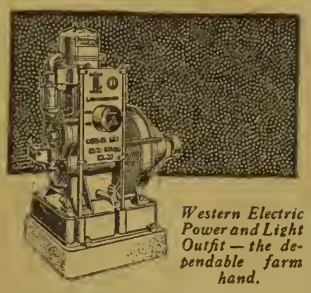
What about the Batteries?

"I have become interested enough in batteries to read up on them a little, and I know now that my battery is geared up a little differently from most other lighting plants. I think the explanation of the Western Electric Company, written by them, is a better one than I can write. If you're interested, read it."

* * *

Note: What Mr. Horning means by "difference" in his battery statement is this:

The charging of the battery is automatically controlled. At the start the current flows in at a fairly high rate, but as the batteries fill the rate of flow becomes gradually less and less—till at last the current is just trickling in. Then it stops by itself. This "tapering charge" takes the strain off the batteries and so makes them last longer.



Western Electric Power and Light Outfit — the dependable farm hand.

Maybe some of the information that helped Mr. Horning decide will help you, too, in choosing a Power and Light outfit. Write for booklet CC-3 to Western Electrtic Company, at Los Angeles or San Francisco.

Some good territory still available for live-wire representatives.

Bamboos for California

By Ernest Braunton

JAPAN exports 10,000,000 bamboo poles to the United States every year. These will grow in districts of Japan where the temperature drops to 15 degrees Fahrenheit, or less, the snow often breaking down the young growths. In England a temperature of six degrees failed to prove fatal to several of the hardier species. There is no part of California, except in cold mountainous regions, where we may not grow timber and edible bamboos.

California is indeed not without notable collections to prove the statements above quoted. At the plant introduction gardens, Chico, there is a good collection, and one in Golden Gate Park, San Francisco. Dr. H. Tevis of San Francisco has probably the best collection in the United States, and Lloyd Tevis, at Bakersfield, has acres of groves that are of timber size, 50 or more feet high.

Commercial Plantations

In Japan some of the best commercial groves are on comparatively high ground surrounded by rice fields. A favorite site for them is in the deep rich alluvial soils along water courses. The valleys are chosen to get away from strong winds so the young and growing shoots may not be whipped against mature stems and the growing tips injured, for such injury makes an imperfect pole or sometimes none at all. Windbreaks of coniferous trees are planted in Japan and China.

Giant Bamboo

These magnificent plants are on the Tevis place near Bakersfield. The bamboo has not yet come into its own in this country, though its uses are very extensive in China and Japan. It appears to be perfectly adapted to California conditions, and from the experimental plantings which have been made we believe the time will come when its great usefulness will be proven.

From there to San Diego gigantic bamboos are common in ornamental grounds, but no one has attempted to grow them in commercial plantations.

Not Tropical Plants

A popular misconception is that bamboos are tropical in their requirements and to this is due the indifference in regard to their general use throughout the state. But the family is a large one, great in climatic range and size of species. Some are tropical, some are moisture loving, but other sorts grow on dry mountain sides amid the snow and ice of severely cold winters. The range in size is from creeping species that are mere soil covers to giants more than 100 feet high and a stem diameter of seven inches. It is this unsuspected hardiness in large growing species that has prevented wider planting in California, but the largest species grow rapidly and form large groves in commercial plantations of Japan where they are annually visited by 15 degrees of frost. Why need Californians hesitate to plant?

The question that naturally arises is: Why should we plant, and if we plant, where and how? The fact that we annually import 10,000,000 poles would lead us to look into the matter of possible profit; we care not what use is made of them, whether they go for fishing poles, or for prison cells as they do in Japan. The edible species, grown both in Japan and China, are shipped as canned goods to the United States and served in our best hotels at 25 cents a portion. Even in Japan these asparagus like shoots command a minimum price of five cents a pound. Here they will bring at least twice as much. And any agricultural product that markets at ten cents or more a pound is worthy of local consideration.

It seems the quality of the soil greatly influences the texture of the wood for some districts are noted for flint like hardness of the canes. The soil should also be well drained, yet retentive of moisture; they are not swamp plants, though needing much moisture. Stagnant water is fatal to growth, but lands merely subject to overflow are among the best. Borders of canals, streams and ponds are favorable situations. The United States department of agriculture states: "The deltas of rivers, low, irrigated islands, like those in the San Joaquin and Sacramento Rivers, would produce big forests of these valuable plants, while the banks of irrigation canals could be made beautiful by them."

Planting and Care

According to the largest Japanese growers cited, the soil should be stirred before planting as deeply as possible and if heavy should have large quantities of stable manure or other rough material worked in. Much humus is necessary. The plants are set out 12 feet apart each way or 300 to an acre. If the soil is a dry one, plant deeply, but if a moist one, set the plant in a little hillock or mound.

After planting a thin layer of cow manure is spread over the soil and on top of this a layer of straw. This

mulch is maintained throughout the year. Irrigation should be frequent and an annual application of fertilizer is necessary to commercial success. All foliage should be encouraged and fostered, as shade is necessary for the young shoots as they pierce the soil, and is at all times desirable. All shoots appearing for the first three years are allowed to grow, but subsequently only the strongest are retained, the remainder being cut out. This throws the vigor into a few large canes. In Japan where snowfall is so heavy as to break down the shoots, the tops of several are drawn together and tied so that the tent like group will shed snow. No cane is sufficiently mature for cutting until four years old and unless it be cut at that age it deterlorates in market value. A grove is not profitable until about ten years of age. In California we have not given the bamboo proper space, thinning, fertilizer, or water if in well drained soils.

IMPERIAL VALLEY OUTLOOK

The 1919 acreage of cantaloupes in the Imperial Valley was something over 14,000 acres. Government experts concede a 1920 acreage of at least 20,000; leading growers in the Imperial estimate the total at 22,000, and they may be nearest correct. The outlook certainly is as promising as well could be.

The cotton outlook is equally good, or better, for last year's returns were little short of phenomenal, as viewed from past experiences, and the coming year is full of promise. Tomatoes have formed on the young plants, and the acreage is heavy, so unless some unforeseen and unexpected calamity strikes the crop the returns will be high, for the demand will be heavy.

Due to eccentricities and extremes of weather the story of the 1919 lettuce crop is not so alluring, and it is yet too early to prophesy as to its effect on the planting for 1920. Last year's acreage was variously estimated from 7,000 to 9,000 acres of which only about 2,000 were marketed, a total to date of about 2,400 cars. Rains fell so copiously and continuously that the general crop was too much forced in growth, which could not be checked. It seems as if our California climate occasionally takes the bit in its teeth and runs away, making certain crops grow whether we will or no. Then at shipping time came that bad eastern weather with its extreme cold, froze the lettuce in transit and as it was being handled in the Atlantic Coast markets, so that the losses were heavy. The crop is now nearly gone. Two or three weeks ago the shipments were from 80 to 100 cars a day; now they are less than ten. But late planted crops will probably hold the close of the season over to about April 10.

According to a United States market official who has just returned from the Imperial that valley is each year gaining heavily in more staple production. Cotton is of course a prime favorite, but mixed farming, with cattle, hogs, and even sheep in large numbers is each season more in evidence. The unusual success attendant upon alfalfa growing in all parts of the valley makes the livestock industry most alluring and a heavy increase of meat and dairy products is a tidal wave that nothing will stop. The official quoted was firm in his declaration that each year puts valley agriculture on a firmer basis; the speculative days are past, each farmer now knows what is best for him to raise with an assurance of success both as to crop and market returns. Although only passing through the Coachella Valley reports reached him of great activity and enthusiasm over the 1920 onion crop. The state department of agriculture has called a meeting there for March 27 to discuss standardization of the coming crop in packing and marketing.—E. B.

BETTER SEED POTATOES

The 1918 legislature for the first time made an appropriation for the work of promoting and protecting the California potato industry. California potato growers can now be assured of certified seed stock. Under the present program the fields are closely inspected during the growing season and a careful check kept to prevent the spread of diseases and to insure the culture of better seed potatoes. Because of the appropriation the only charge made on the seed grower is the tag tax of ten cents a sack. This is only collected when the stock is finally inspected and tagged under the California department of agriculture.

Mr. Shear, who specialized in potatoes in the East for many years, and has a wide knowledge in that line, says that several California localities have already gone into the raising of seed potatoes. The seed grown in Modoc County, for example, near the Coast, but at a high altitude, has already proved its value for the early or spring crop of Southern California. "There is no question," said Mr. Shear, in discussing mountain grown seed, 'but that seed potatoes grown in a section and at an altitude where the growing season is very short, produce a vigorous plant and an early maturing tuber when planted in extreme southern districts. There are cases, however, when the seed produces vigorous plants but not a heavy yield of potatoes. We are now checking up the experience of various growers so that we may be able to give a reasonably correct record for the benefit of potato growers. Our program is to produce and protect the industry in every way possible.

"One of the objects of my southern trip is to study the matter of grading. There is no question but that certain varieties have tender skins, rendering questionable the use of a mechanical grader. However, Florida has used and continues to use the mechanical grader, even though the Spalding No. 4 variety, raised on the east coast in Florida, is a very tender skinned tuber. The public demands the U. S grades. It looks as though there will have to be some method of doing away with the present faulty system of hand grading now being used in California potato fields. Again, the harvesting will have to be done by machinery. The present wasteful hand method of using the old time potato fork causes a heavy percentage of fork cuts. We are gathering data showing the extent of the losses in harvesting and handling, and soon will be in a position to give California growers much valuable information."

At the last sale of the California Rice Growers at Princeton lower prices were secured than for some time past, ranging about $7.

A Sturdy, Oversize Cord Tire that Establishes a New Standard for Durability and Freedom from Skidding

The Michelin Universal Cord embodies three substantial improvements in cord tire construction: *first*, a new and perhaps unequalled wear-resisting tread-compound; *second*, an improved non-skid tread that offers effective protection against skidding in every possible direction; *third*, a super-sturdy oversize body. These combined advantages result in increased resiliency and a freedom from blow-outs hitherto unknown. For your next tire get a Michelin Universal Cord.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Value of Concentrates

Would like to know where I can get some information on the values of various feeds. Is it cheapest to buy milo at $67.50, middlings at $70, mill run at $57 or barley at $70? What is the value of "Lactine, "Semisolid Buttermilk" and other substitutes for milk for little pigs?—Subscriber, Wasco.

Prof. F. W. Woll of the state university answers: "The percentages of total digestible matter in the grain feeds given are as follows: Milo 79.9 per cent, flour middlings 78.2 per cent, mill run 67.0 per cent, barley 79.4 per cent. It follows, therefore, that at the prices given the buyer pays for digestible nutrients in these feeds as follows: milo 4.2 cents, mill run 4.3 cents, flour middlings 4.5 cents and barley 4.4 cents per pound of digestible matter. Since middlings and mill run both contain a somewhat larger proportion of digestible protein (flesh-forming substances), than either of the other feeds, they are as a rule somewhat more valuable than these pound for pound of digestible matter, but the difference in the relative prices given is not marked and it will be more important to secure a good quality of the feed bought than to choose one or the other feed. In fact, a mixture of the grain feeds will prove a more efficient and palatable ration than either one of the feeds given, and I would suggest feeding ground milo and mill run in the proportion of two to one by weight. This, with either ten per cent of tankage or with buttermilk and skimmilk fed in the ratio of three to five pounds per pound of grain will make an excellent feed for pigs and will produce maximum gains in weight. As to the value of the various buttermilk products, would refer the subscriber to the reply given in last week's Cultivator. Five to six pounds of buttermilk or skim milk has been found to possess a similar feeding value to one pound of grain, and dried buttermilk contains close to ten pounds as much digestible matter as an equal weight of buttermilk. The other buttermilk preparations on the market will come closer to dried buttermilk the more solid matter they contain; many contain less than 40 per cent of solids, however, and are very expensive feeds at the prices asked for them.

Cactus Questions

Two subscribers from Ontario and Kingsburg, inquire as to books or bulletins dealing with cacti in general, as to where ornamental cacti may be purchased, and how to grow cactus from seed.

The only book on cacti is an old one by Watson, printed in England, dealing with the plants under glass in the botanic gardens at Kew; not of much value to Californians. The United States has published two or three bulletins on specific groups of cacti—but, good news—Dr. J. N. Rose, curator of the national herbarium at Washington, is getting out a cactus book that will be the best thing of its kind ever published, but it may be another year before it is out. We do not know of any dealers at present though there is a revival of interest in these plants that will no doubt develop commercial stocks. To grow cacti from seed is easy. Get good clean sandy loam, not too sandy, and without decaying vegetable matter. Sift it through a fine sieve. Fill flower pot saucers nearly full of this fine soil. Sprinkle seeds thinly on top. Cover them slightly. Water carefully with a florists (Scollay) sprinkler or "flick" on water with a whisk broom—they will stand watering freely. Keep in warm place. In a week to ten days the tiny plants will appear. When three weeks old transplant if too thick or pot in small pots.

Brandywine Strawberries

I have set out a patch of Brandywine strawberries and may set out more if reports are favorable. Are they a good berry?—Subscriber, Sebastopol.

The Brandywine is one of the best strawberries grown, being a favorite over a wider range of country, perhaps, than any other variety. But strawberries are so variable under differences in soil and climate that a matter of a few miles often demands a change in varieties grown. We would advise you to inquire diligently at to what ones have proven best adapted to your own district.

Red Strawberry Leaves

Can you tell me why strawberry leaves turn red? Spiders take to these leaves more than to others.—Subscriber, Redondo.

Without fuller information we fear we cannot tell you anything of value if your plants are adversely affected Red leaves are due to age, frosts, etc., and we are presuming that their only seeming abnormality is change of color. You do not state whether or not the plants are in poor condition. Spiders most infest the drier and more mature leaves of all plants.

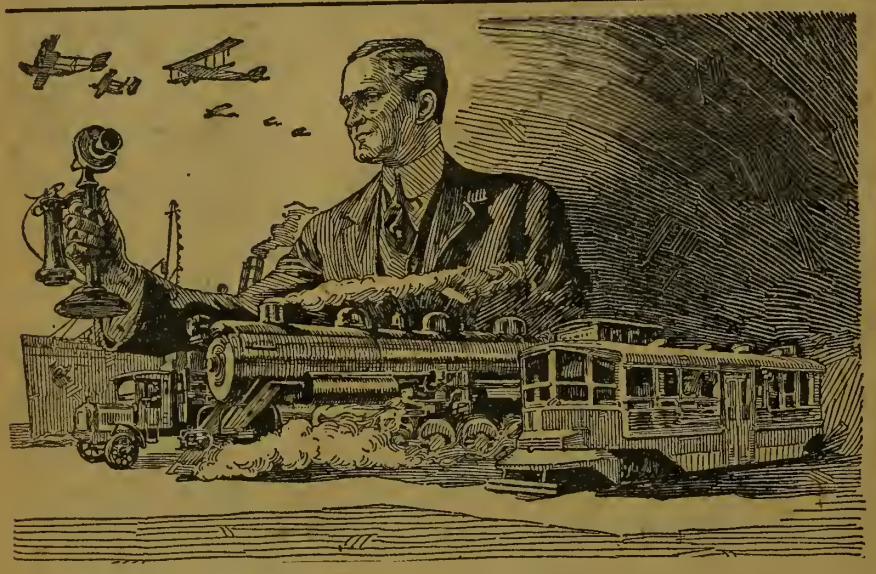
SEED POTATOES IMMUNE TO WART DISEASE RECEIVED

Dr. James G. Sanders of the Pennsylvania department of agriculture has advised the California department of agriculture that there has just been received a ton and a half of 12 varieties of potatoes immune to the wart disease. Dr. Sanders says:

"These varieties purchased by the Pennsylvania department of agriculture will be thoroughly tested for yield and quality in Pennsylvania and the best varieties will be grown in large quantity, to be distributed ultimately for seed purposes in and adjacent to the wart infested regions. Should some of these varieties prove satisfactory they will add greatly to the possibility of controlling this disease and limiting its spread.

"Last year's experiments proved the immunity of our well known varieties, the Irish Cobbler, the Spalding Rose, and the Idaho Rural, so that we now have a basis upon which to work at once.

"The introduced potatoes come from northern Scotland, entirely out of the infested district of the British Isles, and have been grown under certification of the British board of agriculture, whose officers have been very kind and have gone to no little trouble to select these varieties and prepare them for shipment to America."



The Measure of Progress

The progress of the past, as well as that of the future, is measured by criticism—for criticism exists only where there also exists faith in ability to improve.

We do not criticise an ox cart or condemn the tallow dip, for the simple reason that they are obsolete. During the reconstruction period through which our country is now passing, if the public does not criticise any public utility or other form of service, it is because there seems to be but little hope for improvement.

The intricate mechanism of telephone service is, under the most favorable conditions, subject to criticism, for the reason that it is by far the most intimate of all personal services.

The accomplishment of the telephone in the past fixed the quality of service demanded today; a still greater accomplishment in quality and scope of service will set new standards for the future.

RUSSELL
THE OLD RELIABLE LINE

Get All the Grain This Year

With enormous grain crops to handle this year it pays to have your own thresher, and thresh—clean—save your grain at just the right time for best grain and best market.

And with the crop bringing record prices, it is good business to pay a little more if need be for a genuine Russell and make sure of getting and saving *all* your grain.

The Russell is the World's best Thresher, backed by 79 years of success; it has the big easy-running 15-Bar Cylinder, the patented High-Finger Grate, and the patented Spiral Distributing Beater. These features are just a few of the reasons why many thousands of experienced threshermen all over the world demand the Russell in preference to all others.

All six Russell Threshers are alike in design, and have the same exclusive Russell features. Each is built *up to* the old reliable Russell standard—not *down to* meet a price.

Don't buy *any* thresher until you get our big new Catalog describing the up-to-the-minute Russell line of threshers and steam and kerosene tractors—sent free on request.

BASIN OF THE COLORADO

(Continued from Page 619.)

entry of the Ouray reservoir site in the state of Utah has checked the advancement of important railroad and other enterprises necessary to the development of the natural resources of Colorado and Utah, and believing there are other reservoir sites sufficient to fully care for the storing and control of all the water of the Colorado River, without the Minnie Maud or Ouray reservoir sites in Utah, which would inundate and render useless 250,000 acres of land, including several small towns and 20,000 acres of Indian allotments, and which prevents the building of a through line of railroad from Denver to Salt Lake City, that is vital to the interests of northeastern Utah and northwestern Colorado, this reservoir site should be abandoned, that the essential right of way may be granted and development assured to one of the largest and richest mineral and agricultural sections of the Colorado basin;

To Abandon Ouray

"Now therefore be it resolved: That we recommend the abandonment of the Ouray reservoir site unless it shall be shown that such site is absolutely essential to the general development of the Colorado River;

"Be it further resolved that it is the sense of this convention that private projects which do not conflict with the proposed general plan of the Colorado River development should be permitted to proceed with the fullest cooperation of the government, and that a liberal policy should be adopted toward such private enterprises.

"Be if further resolved that in carrying out the plans of the Colorado River project, due consideration should be given entrymen and settlers who have been hindered in their efforts to obtain water for their claims, and that they should be given such reasonable time as may be necessary to complete their proofs.

"We further recommend that no public lands be withdrawn from entry, or if already withdrawn, that no such lands be withheld from entry and settlement, except those proved essential for the project;

For Joint Control

"It is further resolved that the President of the United States be requested to take the proper steps, through diplomatic channels to secure —if possible—the establishment of a joint control, by the government of Mexico and the United States, of the waters of the Colorado River diverted by natural conditions through a portion of the republic of Mexico and again entering the United States, to the end that all leeves, irrigation works and canals constructed for the control of such waters may be properly maintained and protected;

"Be it further resolved that the governors of the states represented in the League of the Southwest constitute a permanent committee and as such be empowered to take such action as they may deem necessary and proper to make effective the suggestions embodied in these resolutions; and for that and the general purposes of the league, they are severally requested to obtain, if it be possible, such financial aid as may be needed from their respective states;

"Whereas, definite results in pooling the water resources of the Colorado basin and arranging a working program can only come through full presentation and study of all engineering data pertaining to irrigable areas, reservoir sites, power sites and water supply of each state;

"Resolved, that to this end a permanent engineering commission should be formed consisting of the state engineers of the several states and engineers of the United States Reclamation Service to study the basin as a whole and prepare a comprehensive plan for immediate action and early development."

The resolutions were presented by Judge Richard E. Sloan of Arizona. Members of the committee were: Gov. D. W. Davis of Idaho (chairman), Francis Cutler for California, Judge Richard E. Sloan for Arizona, Gov. Octaviano Larrazolo for New Mexico, Gov. E. M. Ammon for Colorado, R. S. Gallett for Utah, Charles P. Squires for Nevada, A. A. Jayne and Luther Brown, at large.

California Peanut Industry

By Ernest Braunton

IT has been clearly demonstrated that peanuts may be grown in favorable spots in all sections of the state and are a decided commercial success. That a paying crop cannot be grown on heavy soils is equally true, therefore this factor is of first importance. The soil most favorable is a rich sand or a sandy loam, not coarse dry sand, but a light porous sand or soil that is fairly retentive of moisture. The presence of lime is important. If you market nuts in the shell a clean sand will yield a clean light colored shell, but large growers thresh the nuts and market only the meats or kernels.

Soil should be plowed deeply and made as smooth as possible, for peanuts are planted on the level and ridges should be avoided. No fertilizer is used for there is no plant that gathers more nitrogen from the air than does the peanut, and no California soil so far tried appears to lack any fertilizer element needed by the peanut, even though continuously cropped for several years. The rows are planted 30 inches apart and the nuts four to eight inches in the row. Eight inches apart is an ideal distance if all would grow, but one cannot afford to have any 16 inches apart, so close planting is practiced. A remodeled bean planter, with new parts for the seeds, which are larger in peanuts than in beans, is used and is entirely satisfactory. This plants four rows at once, the nuts being in the shells and 60 to 70 pounds used per acre. The time for planting is from April 15 to May 15.

Culture and Care

A. B. Miller, Fontana, San Bernardino County, the heaviest grower of peanuts in the state, says that irrigation is the keynote to success. As he grew 2,000 acres in 1919 and will plant 3,000 acres this year, there is no doubt but he knows the pivotal point about which crop production swings. Mr. Miller furrows for irrigation just as do the orchardists, and with similar cultivators. He irrigates three or four times during the season when the nuts are growing, once as soon as planted, again in 30 days, to be followed by one or two more applications 15 days apart, following the second, as season and soil demands. This matter must be closely looked into and as closely attended to. Failure of the proper amount of water at the right time is fatal to an early crop, though these wonderful vines will again respond, but produce a later crop. Of course cultivation and weed control present new problems in a really sandy soil, such as has proven best.

As the full crop of Spanish peanuts is produced within two inches of the surface, it is harvested with a bean cutter which reaps two rows at the same time, and by a set of small iron bars at the rear the plants are left in one row. The main harvest comes in September and is treated the same as the bean crop in Ventura County and other Southern sections. But if the crop is later and rains come, quick action is necessary, for both nuts and vines are more absorbent of water than any other crop known in the vegetable kingdom except sponges Four days after a rain peanuts lying on the soil will rot. Should an emergency arise, the plants are strung on stakes for drying just as is done with the "goober peas" in the "Sunny South." Stakes eight feet long are driven about 18 inches into the soil and six inches above the surface a piece of lath is nailed, and on these stakes the plants are strung for drying, the lath preventing the stack from coming in contact with the soil.

A Hill of Spanish Peanuts
The variety best adapted to California and the one most generally grown.

The Crop

Except the crop is sold in the shell, which may be stained by water, it is in no wise injured by rain if quickly dried. The peanuts are threshed on Mr. Miller's ranch by a remodelled bean thresher, which works perfectly When well cared for the yield at Fontana is a ton to the acre; in war time, with war time help from Uncle Sam, the production was but 1,200 pounds to the acre. All the 1919 crop from this big ranch was absorbed by Los Angeles in the peanut butter and confection factories, and the outlook for 1920 points to the same local absorption, for the demand is for at least 15 carloads of shelled nuts annually. The growers last year were paid 18 cents a pound.

The only variety planted is the White Spanish, as it is superior to others in oil content and equally valuable for other uses. While the Virginia and Georgia varieties are larger in the individual nut, they do not rival the Spanish in any other respect. The nuts contain about 45 per cent of oil and 35 per cent of this is recoverable in the oil mills. No oil has been produced locally since this country entered the world war, as the nuts are more valuable for food purposes. Mr Miller says that peanut straw is similar in food value to alfalfa and that for some livestock he prefers it. The crop of straw is about equal in weight to the crop of nuts. Few realize the extent of the peanut industry in the United States, but last year's crop was estimated at a value in excess of $100,000,000. The value for crushing at the mills has in the past been about $100 a ton, the price of course being largely controlled by the price of lard. The plants are splendid soil renovators and have few rivals as collectors of atmospheric nitrogen. The state which leads in peanut production is Texas.

FEDERAL
Double Cable Base Tires

Federal Black Non-Skid Cord Tire

Rim-Secure—Road-Sure

Do not let chafing rims make chaff of your tires. The Federal Double-Cable-Base ends this trouble.

Against the straining pull of the road, four stranded steel cables hold the tires *always* securely against the rim.

For this reason Federals travel farther on the road because they cannot creep on the rim, blow out, just above the rim, shift or come off.

You might as well *have* the miles Federals *save* from the rim.

You can get them *only* with Federal tires.

ONE KIND OF ABILITY

Hewitt—Gruet claims to have considerable ability in his head.

Jewett—Yes, I have seen him wag his ears.

SAFETY FIRST ON THE FARM

By Frank A. Huntington

While so much is being said in the newspapers and by lecturers about safety rules as applying in factories, mines, street crossings in cities, on children's playgrounds, etc., why isn't it a good time for farmers to consider accident prevention?

Newspapers constantly report accidents caused by farm machinery striking stumps or boulders in fields being plowed, cultivated, or cropped. For instance, last summer an elderly man was killed by being thrown off his binder against a transmission chain which caught his clothing and drew him into the machine. The accident was caused by a boulder against which the binder struck while cutting wheat.

After the accident the field was cleared of stones. But why wait until someone is killed or severely hurt before thinking of a cleanup? Why are so many people prone to lock the stable after Dobbin has been stolen?

Another farmer near me nearly lost a leg, due to his mower guards catching on a low hidden stump in the grass he was cutting. An artery was severed and he had a narrow escape from bleeding to death. Of course, the stump should have been marked before the grass became high enough to hide it, or, better still, I believe in blasting them out and being rid of them forever. The stump that caused this accident was taken out after it had done the damage.

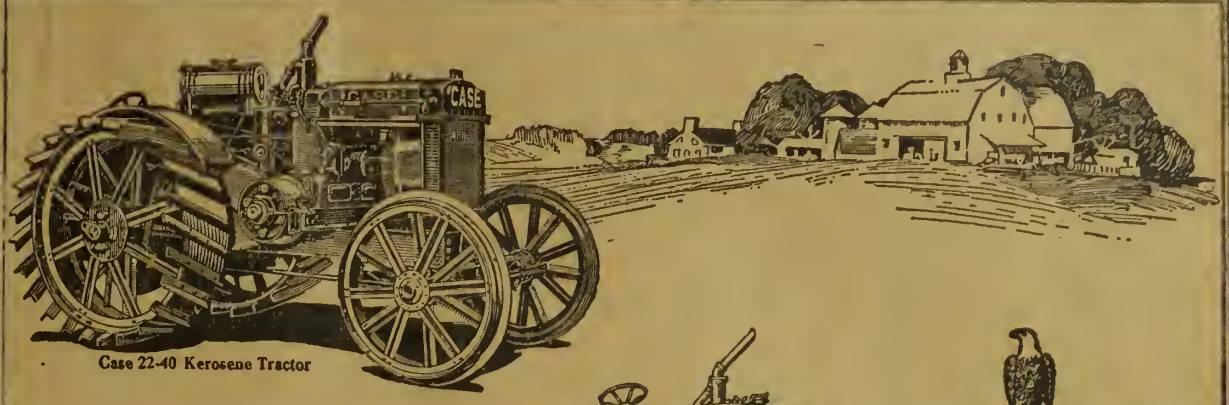
DISTRIBUTE NAPIER GRASS SEED

Packets of Napier grass seed and Merker grass seed are being distributed through portions of the extreme South and California by the United States department of agriculture for the purpose of widely introducing these closely related plants whose value, especially as green fodder for dairy cattle, is now well established. Accompanying the allotments of seed are instructions for planting and the making of cuttings in order that the growers can take care of their own and their neighbors' future needs. Napier grass was first introduced by the United States department of agriculture in 1913 from Africa and Merker grass somewhat later. Experimental plantings have shown that they will thrive south of a line drawn from Charleston, South Carolina, to Shreveport, Louisiana, also in the southern portions of Texas, Arizona and New Mexico, and in portions of California.

As forage plants both grasses are still regarded as being in the experimental stage, but federal scientists state they are both very valuable, but further data as to their value in comparison with Japanese sugar cane, corn and sorghum are needed. Attention is called to the fact that attempts have been made to apply other names to Napier grass, namely Japanese bamboo grass and Carter grass. The use of these names is not desirable, according to the government's representatives. Some of the advertisements setting forth the value of these grasses are probably too enthusiastic, but that the grasses are valuable new assets is clearly demonstrated.

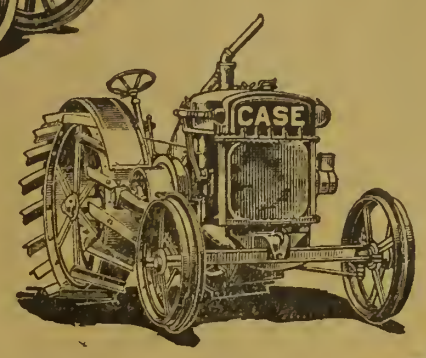
THE COMPOST HEAP

A large part of the value of manure is due to the effect of humus. The small rancher with a cow or horse could greatly increase the amount of humus by developing a compost heap. It is suggested that all the leaves, weeds that do not bear objectionable seeds, pieces of sod, clippings from the lawn, straw, hay, and the like, that are lying around loose, be placed together as a layer of a compost heap. A layer of moist manure would probably follow and again a layer of dry material. In the course of a year this heap would not only increase the amount of fertilizer available but would prevent the loss of the most valuable portion of the manure pile, the fluid portion, due to leaching. The layer of dry stuff would absorb what would otherwise run off and soak into the ground. The high prices of manure fertilizer in California should make this valuable by-product one well worth conserving.—J. G. J.



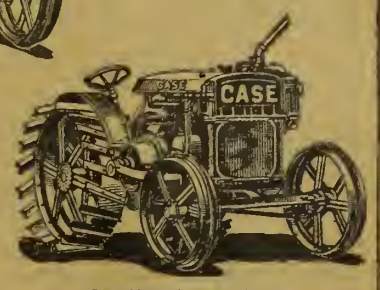
Case 22-40 Kerosene Tractor

To avoid confusion, the J. I. CASE THRESHING MACHINE COMPANY desires to have it known that it is not now and never has been interested in, or in any way connected or affiliated with the J. I. Case Plow Works, or the Wallis Tractor Company, or the J. I. Case Plow Works Co.



Case 15-27 Kerosene Tractor

Look for the EAGLE Our Trade Mark



Case 10-18 Kerosene Tractor

We Could Build Case Tractors Cheaper— But They Would Cost You More

Built into every Case Kerosene Tractor is a high degree of immunity from frequent repairs, replacements and undue wear. These items and the delays they cause are expenses you must add to the first cost of any tractor designed and built less excellently than the Case.

It would cost us less to use iron castings in many places instead of the drop-forged steel we do use; but it would cost *you* far more for replacement of broken and worn out parts.

We could save a lot by using cast-iron open gears instead of cut steel gears running in oil-tight housings; but later on, you'd pay many times the difference for extra parts, and lose still more by delay.

Thus, all through, in design, material, workmanship and equipment, we build Case Kerosene Tractors the best that they can be built instead of building cheaply and "passing the buck" to you.

Case Kerosene Tractors are built in a standardized design of three sizes: 10-18, 15-27 and 22-40 h.p. respectively. Your proper choice depends only on your power requirements. They are uniform in dependability, durability and simplicity of operation and adjustment.

Back of Case Kerosene Tractors is the great line of power farming machinery built by the J. I. Case Threshing Machine Co. Of this line, each unit is unexcelled in its class; within this line is equipment for keeping a Case Kerosene Tractor profitably employed throughout the year. Write for free catalog descriptive of Case Tractors, and listing our great line of tractor drawn or driven machinery.

KEROSENE TRACTORS

An Unusual Holstein Offering

In the usual public sale of registered Holsteins the buyer of young heifers and heifer calves has a small range of selection, but here is a sale made up entirely of heifers and heifer calves, and a lot of choice young bulls.

This is a COMPLETE DISPERSAL of the young registered Holsteins at

Bonita Stock Farm, Lodi, Cal.

Tuesday, April, 20, 1920

This herd of young things is one of the typiest offerings yet made in the state. They are well grown, well marked, in splendid condition, and of most substantial breeding.

63 Heifers and Heifer Calves

There are a few bred heifers in the offering, and the rest range from yearlings down to young calves. A large number are sired by SUPREME GLISTA PIETJE, whose dam twice made over 32 pounds butter in 7 days and made 631.35 lbs. in one year, and his sire's dam made 827.31 lbs. butter from 18623.7 lbs. milk in one year. The dams of these heifers are splendid young cows, a large number with official records up to over 26 lbs. butter in 7 days, and most of them have cow test association yearly records that will be valuable in guiding the selection by buyers.

27 Excellent Young Bulls

Every bull in the herd will be offered in this sale. Quite a number are now ready for service, and most of them are sired by SUPREME GLISTA PIETJE, mentioned above, and out of some of the best cows in the herd. This is one of the real opportunities of the season for dairymen to secure good young bulls.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; NO ANIMAL TUBERCULIN TESTED.

Catalog free on request to management.

DISPERSAL SALE

75—Registered Holsteins—75

Leeman & Kilgore Ranch, Ripon, Cal.

Wednesday, May 12, 1920

To dissolve the existing partnership between Leeman & Kilgore it is necessary to offer at public sale the high class herd of registered Holsteins now owned by them. This is rated as one of the best bred herds in California, and is a collection of good individuals that will be offered in good physical condition.

High Record Cows

MISS GELSCHE WALKER KORNDYKE, the great 32 pound daughter of Prince Gelsche Walker, is among the many high record, highly bred young cows in the sale, and there is a choice selection of A. R. O. cows and heifers of most attractive breeding.

Daughters of High Record Cows

The young things in the sale include daughters of such famous bulls as King Mead of Riverside, King Morco Alcartra, Segis Pontiac De Kol Burke, and Sir Aaggie Korndyke Alcartra, out of the high record cows in the herd.

An Extra Choice Selection of Bulls

The offering of bulls in this sale is unusually attractive. The two herd bulls will be sold. The senior sire is Sir Aaggie Korndyke Alcartra, who is by Prince Alcartra Korndyke, son of Tilly Alcartra. The junior sire is King Gelsche Walker Korndyke, son of Miss Gelsche Walker Korndyke and King Morco Alcartra, son of Tilly Alcartra. The sale also includes some richly bred young bulls by such sires as King Morco Alcartra, Sir Aaggie De Kol Acme, King Korndyke Pontiac 20th, It, and Sir Aaggie Korndyke Alcartra.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER. EVERY ANIMAL, EXCEPT A FEW AT THE END OF THE SALE, TUBERCULIN TESTED AND SOLD SUBJECT TO RETEST BY THE BUYER.

Catalog free on request. Management

Milking Shorthorns

May 5, Thos. Harrison, Santa Rosa.

Poland Chinas

April 24, W. T. Dice and Harrold Waltz, Hanford.

Announcement has been made that Professor O. E. Reed has resigned as head of the department of dairying at Purdue University, Lafayette, Indiana, to become superintendent of live stock production for the Gossard Breeding Estates, operating farms at Martinsville, Indiana, Preston, Kansas and Axial, Colorado. Professor Reed is well known to the dairy interests of this state, having served as judge at a number of California shows.

Thos. Harrison, proprietor of the Santa Rosa Stock Farm, Santa Rosa, has claimed May 5 as the date for his sale of milking Shorthorns. The forthcoming sale will be the first sale of milking Shorthorns ever held in the West.

C. R. Thomas, manager of the Los Angeles Livestock Show has just returned from a successful business trip to the livestock sections of the Middle West. Putting into practice his preachments along the line of livestock improvement for the coast country, Mr. Thomas has placed no less than 106 pure bred Shorthorn and Hereford bulls in California and Nevada since early February. He is now pushing to completion plans for holding one of the biggest livestock shows ever put over on the Pacific coast. All forces and interests are being carefully and systematically organized to make livestock a supreme factor in this big annual event.

The Toyon Farm Association, San Francisco, announces that which they believe to be a new world's record in the eight months after calving division. Their Lady Aaggie Echo Hengerveld produced 24.69 pounds of butter from 494.4 pounds of milk in seven days as a senior three year old, exceeding the previous record of 453.8 pounds of milk and 23.09 pounds of butter by 40.6 pounds of milk and 1.60 pounds of butter. This new world's record holder is safe in calf to Sir Pietertje Ormsby Mercedes 443d, one of the best sons of the great yearly record sire Sir Pietertje Ormsby Mercedes, out of Aaggie Wayne Peep three times over 30 pounds in seven days and four wonderful yearly records averaging over 1,000 pounds in the year. This calf with a world's record dam and combining the popular blood of Sir Pietertje Ormsby Mercedes on the sire's side with that of Spring Brook Bess Burk 2d carried on the dam's side through Sir Johanna Canary De Kol, the sire of the dam's dam, has a brilliant future in prospect.

The last Poland China sale of the season will be held at Hanford, April 24, at which time W. T. Dice and Harold Waltz will offer about 60 head of sows and open gilts. Many of the sows were purchased by Mr. Dice on his recent trip through the East and come from some of the leading herds of the cornbelt. The past season has been a notable one in Poland China activities in this state and it is felt that the Dice and Waltz sale will furnish a fitting close to a prosperous season.

The highest price ever realized for a grade dairy cow at a reported public sale was registered at the sale conducted by Rhoades and Rhoades at their salesyards at Clearwater for Bost and Johnstone on March 31. The record cow had produced 600 pounds of butter fat in a year and was sold to I. J. Scott of Pomona for $700. The bidding on the cow was very spirited up to the $600 mark and from there it narrowed down to a contest between Mr. Scott and J. M. Mayo of Compton. The entire consignment of 26 head sold by Bost and Johnstone averaged $268. One important feature in connection with the herd was the fact that every cow had a creditable rec-

ord in the farm bureau cow testing association and the owners were able to furnish the proofs of production. Having association records back of good cattle is of great value in the sales ring.

STOCKMEN TO MEET

California cattlemen gather in Blanchard Hall, Los Angeles, next Thursday, Friday and Saturday, April 15, 16 and 17. California cattlemen have been confronted by the problem of no pastures and continually advancing feed and continually declining prices for their cattle. We imagine there will be some very pungent questions asked in the convention, but we fear there may be none qualified to give conclusive answers. In any case, the sessions will be filled with interest and we trust prove profitable to the industry.

THE GOAT INDUSTRY

(Continued from Page 607.)

California Cultivator of May 18, 1918, remains to be seen. California Gretel was a pure bred Toggenburg and in 365 consecutive days produced 2,941.5 pounds of milk and 97.41 pounds of butter fat. This amount of fat would produce 120 pounds of butter, enough to supply a family the entire year.

Mr. McLaughlin has reason to believe that several of his coming producers will equal, if not exceed, the record of his Polly-Mac. To be more respectful, the full name of this little creature is Rosemont's Polly-Mac No. 1263. Her greatest production in 24 hours was 15.4 pounds of milk, or 452.6 pounds in one month. Both Polly Ana and Lassie Mac have produced materially above the amounts quoted by the university test.

There are literally hundreds of goat dairies around the city of Los Angeles. There are also many near San Francisco though they have not been such great favorites in that section as they have farther south.

* * *

By Ernest Braunton

The Toggenburg goat comes to us from Switzerland where this breed has been selected from the wild goat and bred for milk production for centuries, therefore has as long a line of ancestry as any breed of domestic animals. Those now in California are still largely high bred grades, but eligible to registry. The progeny of a half breed Toggenburg, if sired by a registered pure bred may be registered. Investigation by the writer shows a liberal number running seven-eighths or more Toggenburg, but five-eighths are more common. Half breed does are bred to a pure bred buck and then bred back to a male offspring. More of these were found in new herds than any other class. Nearly all of them are wonderful milk producers and it is no doubt because of this fact that the rancher does not go a step higher; the breeder does. Many pure bred sires are imported though but very few dams.

Results of Experience

Before the world war it was estimated that 75 per cent of the households in Germany and Mediterranean countries kept goats. They were not confined to the poorer classes but the prosperous middle classes depended upon them for milk, butter and cheese. In some countries goat meat is a favorite article of food and during the last few years' stress abroad the goat has played a far more important part in life saving than in America. Back in 1910 an Australian wrote: "We had a terrible season last year and lost heavily in sheep, but the goats kept us in milk at all times and they are now furnishing our family of eight with all necessary butter and milk. In the dry days I overcame prejudice against goat flesh and ate and keenly relished it."

Jensen, in "Milk Hygiene," gives the following composition of milks:

	Goat	Cow	Human
Water	87.30	87.75	87.92
Casein	3.00	3.00	0.58
Albumin	0.50	0.50	0.52
Fat	3.90	3.40	3.43
Lactose	4.40	4.60	7.12
Salts	0.80	0.75	0.25

In California results have been highly gratifying, especially in regard to low cost of keep. A few years ago a rancher was pasturing and feeding does and charged one dollar a month. The writer interviewed two breeders at Pasadena and Altadena, and both said the total cost per day for milch does throughout a six months' production season is never more than 15 cents a day and these produce an average for the season of from four to five and a half quarts daily. One claims the latter amount for a full seven months' period for one doe for the past five years, the animal in question being seven years old. It is certain that compared with cost of keep they yield more than any milch producing animal.

Breeders usually prefer having a considerable range in period of productivity and consequently breed some early in September and October, and others from January to March. E. W. Patrick of Altadena is at present milking eight high grade does with kids but a week or two old. He takes the latter away as soon as born, even if he has to sit up nights at times to be present at the birth.

They are fed on the bottle for from three to five months, though they will begin to nibble hay and green food at about six weeks of age. Corn meal is cooked, merely brought to a boil, in a very thin gruel, and this is gradually mixed with the milk, beginning when the kids are three to four weeks old, and continued until they eat solids. Green stuff and hay is given them at three months and they gradually fall into the eating of it. The milkers are fed bran and beet pulp, nearly equal quantities, sometimes a dry mash, at other times wet. Alfalfa hay is the one fundamental feed and on sandy soils where alfalfa will not grow elephant grass proves a good ration. After weaning some oats are fed and some feed oats to milkers. Goats like a variety and so love to range the hillsides.

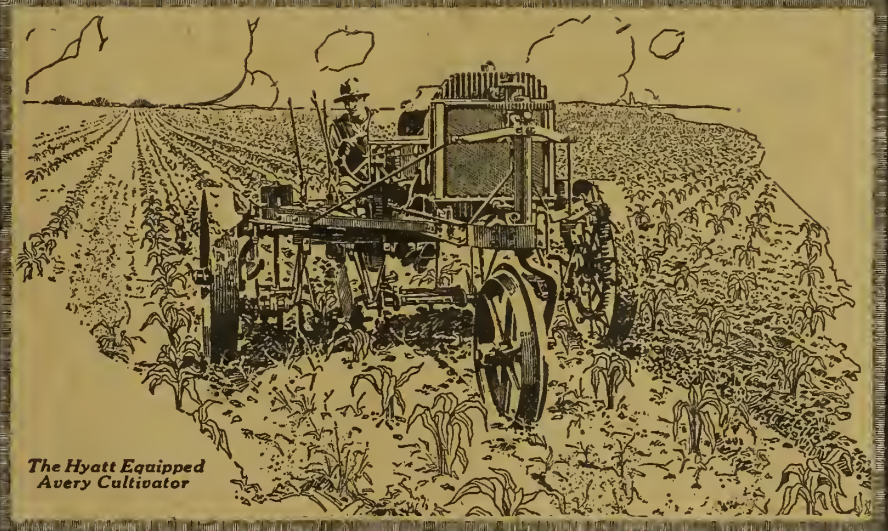
HYATT
ROLLER BEARINGS
For Motor Cultivators



The Hyatt Equipped Avery Cultivator

IT is a significant fact that practically every motor cultivator on the market today, built with anti-friction bearings, is equipped with Hyatts.

Hyatt Bearings keep the cultivator wheels running true, prevent wear and save hours of oiling, because they need the oil but once a season instead of twice a day—and do all this under hard duty amid dust and dirt, giving a permanent, care-free performance.

And such are the reasons for the predominance of Hyatt Bearings, not only in motor cultivators, but in all power farming machinery, such as tractors, grain binders, plows, threshers, wind mills, trucks, etc.

Shasta County Declares for Pure Breds

By Parker Talbot, Farm Adviser

During the two years of its existence the Shasta County farm bureau has been instrumental in accomplishing considerable in the improvement of livestock. The work was started last year by bringing into the county pure bred pigs for the boys' and girls' pig club. This work, carried on in cooperation with 40 boys and girls, has been the means of spreading the influence of pure bred hogs to many farms.

During the current year the farm bureau has planned to do its utmost to extend the interest in beef cattle. The start was made at the Fall River fair in the eastern part of the county last fall. The best stock of the valley was brought to McArthur and placed in classes which were judged by W. M. Carruthers, a prominent breeder of Live Oak.

At a meeting of the local stockmen's association at the close of the fair a committee composed of James R. Day and Dennis Cessna was sent to Davis and vicinity to buy eight head of registered Shorthorn bulls. The animals purchased were young and stood the buyers $300 a head.

After the Anderson fair in the western part of the county a party of ten stockmen went to Davis to buy pure bred bulls. Five head were purchased from the Caledonia herd, all first class animals. These bulls went to E. A. Stopher of Balls Ferry, Charles Hufford of Millville and Money Hickman of Gas Point.

At the time of the stockmen's week at Davis, during February, a party was made up of Henry Lonquist, Perry Opdyke, Vernon March and Ralph Bidwell from Hat Creek, E. A. Stopher and W. W. Foster of Gas Point, to attend the cattle sales and bring back some bulls averaging $450 per head.

One Hereford bull, eight head of Shorthorn bulls and two Shorthorn cows were purchased at the auction sales. The average price was $400 per head.

W. W. Foster bought 12 head of pure bred Shorthorn bulls at a private sale on the Conway Ranch.

Within the last six months about 40 head of pure bred bulls have been introduced for use on the range and they have gone into four different parts of the county.

The distance from the Fall River Valley to Gas Point in the western part of the county is about 100 miles, showing that the interest in better cattle is not centering around one locality.

The farm bureau has planned to follow up the start made by bringing in ten head of Shorthorn calves which will be placed with ten boys and girls, who will be members of a calf club organized under the auspices of the college of agriculture.

The California Shorthorn Breeders Association has authorized their secretary, David J. Stollery, to select the calves. The Northern California National Bank of Redding will pay for the entire shipment and arrange with each boy or girl to take their note in case they do not have the ready money to pay for the calf. The main requirement is that the new owner can show that he has the feed.

Why Federal Accreditization for California Herds?

It is axiomatic that no business can ultimately reach its full logical development unless all elements of that business be raised to the highest standard possible. Our dairy industry in California, as at present constituted, has not complied with this demand of good business. We have built up good herds, good in milk production, good as show cattle, raised under excellent conditions of soil and climate. Our show herds are forcing the East to the acknowledgment that the West coast must be reckoned with in the great Eastern show rings. With all this mass of excellence there is the deep underlying current of work not well done. From the practical side why is it that foreign buyers to a great extent pass us by? Important buyers landing in San Francisco look to the east and north and seldom consider the cattle of this state. The answer is plain. Our lax position on the vital question of bovine tuberculosis; our laxity in not following the precept of the majority of the states of the Union in the matter of federal accreditization.

California, in the forefront in most constructive movements, has chosen to ally itself with a pitiful minority of three states in this fundamental consideration. Our failure to take a stand in this matter is being construed by breeders elsewhere as an admission that the health conditions in our herds are such as to discourage their owners from tuberculin testing. Once this thought germinates fully and it is proven by further demonstration that we do not care, we will not only block purchases from overseas but will block purchases from within our continental limits.

This whole consideration is not of purely present moment. Inevitably state and federal legislation backed by the demand of our medical profession and local boards of health will require the eradication of this scourge. Happy then is the forehanded breeder who has developed a clean herd. This condition is as absolutely inevitable in the future as the rotation of the seasons.

The mechanism now extant which will ultimately mean the practical eradication of bovine tuberculosis, first in the important herds of pure breds and later the grade herds, is state and and federal accreditization. The practicability of cleaning up a herd by this method is, of course, a matter of opinion, but it has had marked success in practically every state in the Union. State after state has fallen into line until all but three are now in the ranks, and one of the three is California.

The present method of procedure is in substance as follows: The rules were formulated by the unanimous action of the United States Sanitary Association and by representatives of pure bred cattle breeders' associations.

1. A tuberculosis-free accredited herd is one which has been tested by the subcutaneous method, or any other test approved by the bureau of animal industry, under the supervision of the federal bureau or a regularly employed veterinarian of the state in which cooperative tuberculosis eradication work is conducted under a joint agreement. Further, it shall be a herd in which no animal affected with tuberculosis has been found upon two annual or three semi-annual tuberculin tests, as above described, and the physical examination.

2. Any or all cattle shall be tested or retested at the option of the state or federal authorities.

3. An accredited herd in which not more than one reactor is found at a subsequent tuberculin test may be reinstated to the list if the entire herd passes a successful test without reactors; said test to be applied not less than six months from the date when the reactor is removed from the herd and farm.

4. No cattle other than accredited cattle shall be added to an accredited herd unless they have passed two tuberculin tests applied at intervals of not less than 60 days or more than 90 days by a regularly employed state or federal veterinarian.

5. When a herd has been officially accredited continuously by the United states department of agriculture and state for a period of two years, it may then be tuberculin tested annually by any veterinarian whose name is on the accredtied list of veterinarians.

6. Before a herd can be accredited the stables and premises shall be placed in a sanitary condition.

7. Prior to each tuberculin test satisfactory evidence of the identity of the animals shall be presented to the inspector.

8. All removal of registered cattle

For the Prevention of

ANTHRAX

Of all livestock diseases, anthrax is one of the most fatal.
For the preventive and curative treatment of anthrax we offer

ANTHRAXOIDS

(Spore Vaccine)

For immunizing cattle, horses, sheep and mules.

Anthraxoids are Anthrax Spore Vaccine in pill form. Each Anthraxoid is a dose ready to be injected under the skin of the animal.

Antianthrax Serum

A serum to be used when animals show symptoms of anthrax.

Anthraxoids-Antianthrax Serum

(Simultaneous Treatment)

Double vaccination with serum and vaccine. Used when anthrax is established or suspected to be in a herd.

Write for free booklet on the Prevention of Anthrax.

Los Angeles, Calif.

Beef Cattle Specialist

For 30 years I have been devoting my entire time to pure bred beef cattle. I know where and how to buy. I make regular trips to the great producing centers and will buy on order. Best of references. Satisfaction assured. Correspondence invited. R. M. DUNLAP, Hotel Land. Sacramento, Cal.

from the herd, either by sale, death or slaughter, shall be reported promptly to the state or federal officials.

9. All milk and other dairy products fed to calves shall be produced by an accredited herd or if from outside or unknown sources, shall be adequately pasteurized.

Strict compliance with the regulations governing accredited status entitles the owner of the herd to a certificate "Tuberculosis-Free Accredited Herd" to be issued by the bureau of animal industry and the state live stock sanitary authority.

A supplementary list shall be made to the accredited herds list to contain the names of the owners of pure bred herds that are found free from tuberculosis on two annual tuberculin tests but in which the herd bull reacted. Such herds shall not receive an accredited herd certificate. The reacting bull may be used under the following conditions:

1. He shall have passed a satisfactory physical examination and be kept in isolation and quarantine under state supervision.

2. When it is desired to breed cattle to the reacting bull, such cattle shall be taken to the bull and bred on neutral ground. The bull shall be controlled on a staff or halter.

The mechanism here described in brief is naturally difficult. It means labor, time and money to evolve a herd that will meet the rules. This labor, time and money has been expended by progressive owners in practically every state and they are satisfied and are beginning to reap the harvest of their good accomplishment. It makes the path a little easier to contemplate if we recognize that pasteurization of impure milk is merely the legalization of disease. Such legalization is bound to fall in the future. It is the compromise for a temporary condition and as soon as sufficient time for education has elapsed it will cease to be the main reliance of the health authorities and will be merely an added safeguard. The logic of this statement is apparent. The answer to the progressive breeder is also apparent. He will recognize the condition and clean up his herd against the day when his neighbors will come to him and say, "To stay with the breeding game I must do as you have done. I have come to buy." That time will be the time of extra profit. A reward to him who has seen the writing on the wall and not only seen but read the answer.

The federal government at present stands ready to conduct this work in this state. They, as a matter of fact, already have a man here for the purpose, who on account of the state's present inability to cooperate, is doing work other than that originally intended for him. The state veterinarian is at present practically helpless, due to the lack of funds. These funds will probably not become available unless there is a demand made for them. It has however been possible in the case of one Holstein breeder to start this work under state and federal supervision, due to the fact that accredited herds were bought in other states and kept under the regulations governing, upon arrival in California. To this breeder is due much credit for initiating this movement here. That his lead will be followed is certain and then California will be relieved of the stigma of endeavoring to play a losing game.

ADVERTISING LIVESTOCK

There are many ways of securing live livestock advertising. Perhaps one of the best, next to a reputation for always putting out dependable goods, is the agricultural fair. Next to that possibly comes the farm paper, and if the breeder has a line of stock with grand champions at some of the national shows, the large national breed journals afford profitable mediums. But in addition there is the printing press always available and often near at home. Earle McCune, a Poland China breeder of Lemoore, Kings County, is using the printing press most effectively. He sends out legal size envelope with neat card on upper left hand corner with enclosure of blotters of good quality on which are calendars, this time for the month of April, and a short note as to the Earle McCune ranch at Lemoore. In addition Edith Rose gets a neat little notice with a few words as to her breeding. It's good advertising.

Lendorris Liberty Bond and Young Jumbo

assisted by BUSTER LEN comprise our battery of herd boars

From the standpoint of popular bloodlines and individual excellence they are unexcelled.
Our sow herd is worthy of mating with our three good boars. The young stock for sale have the size and feeding qualities so much desired.
We solicit your correspondence.

W. L. Haag and Son Hanford, Cal.

Giant Bob, Grand Champion

and the son of a champion, assisted by Golden West King and Blue Valley King are three reasons for the popularity of our herd and indicate why you should join our rapidly growing list of customers.

These three boars are siring the class of pigs the public demand. Write us regarding your wants. We feel confident we can please you.

A. Buckland & Son, R.F.D., Fresno, Cal.

The Grand Champion Giant Bob

highest priced boar in the West heads my herd.

He is ably assisted by The Sequoian, a young herd boar of great promise. These two boars are siring a fine lot of big growthy pigs. They are the right type. Spring pigs, both sexes, $25 and up.

Z. M. Dickey Dinuba, Cal.

Trewhitt's Big Type Poland Chinas

are found in many of the leading herds on the Coast where size and quality predominate. Select your Poland Chinas where the big type ONLY are bred. When you secure a Trewhitt bred Poland China you get something better—not just ordinary.

W. D. Trewhitt Hanford, Cal.

King's Big Bone Leader

is siring the big stretchy kind of Poland Chinas so much in demand. Giant Bob 2nd is justifying our expectations as a young boar of great possibilities.
These boars and their get will meet with your approval.

Les McCracken Ripon, Cal.

McCune's Quality Herd

of BIG TYPE POLAND CHINAS

attained their prominence only by constructive breeding and careful selection as to type, size and quality. This should be the deciding factor in seeing that your next Poland China comes from this herd.

H. D. McCUNE, Lemoore, Calif.

For easy feeding, early maturing Poland Chinas,

Secure the Get of Model Big Fellow

He was Reserve Grand Champion

at the last state fair and is a sire of remarkable worth. I solicit your patronage.

J. F. McSwain Merced, Cal.

Satisfied Customers

are my specialty. Recent sales to old customers prove to me that Forrestview Bob, a son of Caldwell's Big Bob, is siring the class of pigs that have made this great family of hogs famous.
Write me your wants. I strive to please.

J. H. Cook Paradise, Cal.

Aviator

A boar of outstanding individuality and one that is proving to be a sire of unusual merit. His pigs find a ready market. Order yours today. Satisfaction assured.

CROSS BROS MERCED, CAL.

I AM OFFERING

exceptional values at present. A few bred gilts left. Some choice pigs ready for shipment. Write for prices, they are reasonable. Full description sent on request.

Eugene Miner Lodi, Cal.

MEETING OF CALIFORNIA HOLSTEIN-FRIESIAN ASSOCIATION

At a meeting of California Holstein-Friesian Association, held at Sacramento, March 24, a number of matters of importance to the interests of the breed in California were acted upon.

Gion W. Gibson, Williams, was elected to serve on the committee in charge of arrangements for the coming California Dairy Cow Competition, which will be in charge of Prof. F. W. Woll, University Farm Davis. H. V. Bridgford, Knightsen, F. L. Morris, Woodland, W. J. Higdon, Tulare, and Horace L. Hill, Jr., Los Altos, were elected as delegates to represent the state associa ion in the annual meeting of the Holstein-Friesian Association of America, at St. Paul, Minn., in June.

A resolution was introduced and unanimously carried commending J. M. Henderson for the splendid work he is doing in behalf of the dairymen of California in the organization of the producers associations. It was voted to present a registered Holstein heifer calf to the agricultural high school student winning the high place in the judging of Holsteins at California state fair this year.

R. P. Royce, livestock editor of California Cultivator, made a strong plea for support of the California International Livestock Show at San Francisco, and it was the sense of the meeting that the show should be strongly supported by the Holstein breeders of the state.

An invitation was extended to the Holstein Association by Tulare Livestock Association to hold a meeting at Tulare on the evening of May 4, and the invitation was unanimously accepted.

President H. V. Bridgford presided at the meeting, which was attended by about 100 breeders representing practically every section of the state. —C. L. Hughes, Secretary.

REMARKABLE HERD PRODUCTION

B. D. Mason, state dairy inspector for Humboldt and Del Norte Counties, in his report to the California department of agriculture states that Mr. Buzzini of Crescent City is the possessor of a herd of 19 cows of remarkable production. During the period March 1, 1919 to February 1, 1920, these 19 cows produced 233,269 pounds of milk and 9058.6 pounds of butterfat, which brought to the owner the tidy sum of $7,069.44. This gives as averages per cow 12,277.3 pounds of milk, 476.7 pounds butterfat, and $373.07 gross receipts. The cows were grade Holsteins. Mr. Buzzini apparently knows how to feed and care for his stock. This demonstrates that it is possible for dairymen not only to have cows, but to have cows that give milk.

THIRD LOS ANGELES LIVESTOCK SHOW ANNOUNCED

Plans are on foot for launching the third livestock show at Los Angeles. The board of directors at present consists of E. W. Murphy, Harry Chandler, Harold Braly, Clinton E. Miller, F. E. Lewis 2nd, H. B. Woodill, Walter M. Ross, Herman Hauser, Albert H. Paul, Dr. Frank F. Barham, Fred H. Bixby, Frank Wiggins, Walter P. Story, H. A. Jastro, Chas. H. Hill, Geo. M. Brown, Frank Simpson, T. H. Dudley, J. C. Adams, Edward A. Dickson and Geo. Lichtenberger.

Officers are: President, E. W. Murphy; first vice president, Clinton E. Miller; second vice president, Harold Braly; secretary and manager, C. R. Thomas; treasurer, Albert H. Paul.

Z. M. Dickey, Dinuba, has an excellent show prospect in his junior herd boar The Sequoian. As yet Mr. Dickey is most too busy with vineyard work to think of the fall shows, but it is to be hoped that he will decide to give this youngster an opportunity of competing with the big fellows next fall.

The veteran Poland China breeder and showman, W. A. Young, Lodi, has a futurity litter sired by Long Big Bone Jr. and out of Black Beauty C., reserve grand champion at Sacramento last fall that Mr. Young feels will "be there" on show day. The bulk of his show herd, including one outstanding yearling sow, will be sired by this good breeding boar and so far Mr. Young believes he has as toppy a lot of young stuff as he has had in some time.

Southern California Holstein Breeders' 1920 Spring Sale

120 Registered Cows, Heifers and Bulls

Rhoades & Rhoades Sale Pavilion
Clearwater, California

Tuesday and Wednesday, April 27-28, 1920

This offering features one of the best collections of the breed yet offered in Southern California. An extraordinary lot of heavy producing cows, fresh or heavy with calf to some of the state's foremost bulls, will be an attraction of more than ordinary interest.

KING PAUL KORNDYKE VALE, one of the most richly bred bulls in the west, will be sold, as he heads the herd of W. D. Millard, Arcadia, which will be dispersed in this sale. The sire of this remarkable young sire is King Korndyke Sadie Vale, the only 40 lb. bull to produce a 40 lb. daughter, and the dam is a 31 lb. daughter of Sir Sadie Cornucopia.

SOME EXTRAORDINARY COWS with good short time records and excellent 305 day records will be sold by Burr Farm, Los Angeles, most of them bred to the sensational young sire Sir Veeman Korndyke Pontiac, whose first daughters to freshen have made up to over 24 lbs. butter in 7 days as 2 year olds.

ROSAMAINES RANCHO, Riverside, will sell granddaughters of Prince Gelsche Walker and Tilly Alcartra, bred to King Pontiac Netherland Segis 3d, whose first daughters to freshen have made records that place him among the leading younger sires of the breed.

P. H. KRICK, Anaheim, will make an offering that is made up largely of granddaughters of the great King of the Pontiacs, most of them bred to King Winnie, son of the first cow to make over 1200 lbs. butter in one year in California.

CHAS. S. HARRINGTON, Compton, sells a number of granddaughters of the famous producing and breeding cow Pontiac Clothilde De Kol 2nd, the first cow to make over 1200 lbs. butter in one year or over 37 lbs. in 7 days. These are out of highly bred dams with records up to over 30 lbs. butter in 7 days.

BOST & JOHNSTONE, Corona, sell a granddaughter of King Segis and a granddaughter of King Korndyke Sadie Vale, two heifers of exceedingly rich breeding.

AGEE BROS., Rivera, sell some well bred females bred to TOYON FAYNE VALDESSA, who is a son of King Valdessa, and out of a 30 lb. daughter of King Hengerveld Aaggie Fayne.

W. T. McALISTER, Los Angeles, has a choice offering composed almost entirely of granddaughters of such famous animals as King of the Pontiacs, King Segis Pontiac, and Tilly Alcartra.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; NO ANIMAL TUBERCULIN TESTED

Catalog free on request to management

California Breeders Sales and Pedigree Company

J. M. Henderson, Pres. C. L. Hughes, Sales Manager, Sacramento, California.

Auctioneers: Col. Ben A. Rhoades, Harold B. Rhoades, Los Angeles.

A Sensational Holstein Offering

The dispersal of the W. J. Higdon herd of registered Holsteins, excepting the daughters of King Korndyke Pontiac 20th, ranks as the outstanding event of the year in Holstein sales.

This herd is one of the greatest collections of the breed ever on one farm in the west, a herd that was selected at the beginning with rare judgment, has been developed along the most constructive lines, and is today composed of outstanding young cattle that are only just at the start of their usefulness as producers and breeders. The sale will be held at

Tulare Sale Pavilion, Tulare, California

Wednesday, May 5, 1920

Six 30 to 36 Pound Cows Go Under The Hammer!

The list of high record cows includes HOLLYWOOD LILITH PONTIAC, 36.20 lbs. butter in 7 days as a senior 3 year old, the California record, also the two cows that were originally selected from Mr. Higdon's herd to go to the St. Paul Sale. The offering also contains

A COW WITH OVER 1000 LBS. BUTTER IN ONE YEAR!
A 2 YEAR OLD WITH OVER 800 LBS. BUTTER IN ONE YEAR!
A 3 YEAR OLD WITH OVER 800 LBS. BUTTER IN ONE YEAR!
DAUGHTERS OF MANY OF THE GREAT COWS THAT HAVE BEEN DEVELOPED IN THE HERD!
A WONDERFUL LOT OF DAUGHTERS OF PRINCE RIVERSIDE WALKER, THE FIRST TO FRESHEN WITH RECORDS UP TO OVER 22 LBS. BUTTER IN 7 DAYS AS 2 YEAR OLDS!

The female offering has never been exceeded in quality in any public sale offering in the west, even the picked sales, and it will be a very rare opportunity to buy high record, clean young cattle of very high type.

Who Will Own King Korndyke Pontiac 20th?

KING KORNDYKE PONTIAC 20TH will pass into new ownership in this sale, and the man who is fortunate enough to buy him will have at the head of his herd one of the greatest of the present day Holstein sires. He has everything required in a real herd bull, and his two first daughters to freshen prove his transmitting ability.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL OVER SIX MONTHS OLD TUBERCULIN TESTED AND SOLD SUBJECT TO RETEST BY THE BUYER.

THE BEST SOURCE

of Nitrogen for Citrus Fruits is

NITRATE OF SODA

because of its instant availability as plant food. Growth is promoted immediately after the application is made.

It is taking chances to apply any Nitrogenous Fertilizer which is not Immediately Available as food for plants, because of the tendency to unduly prolong growth and to delay maturity. It is also fatal to apply high-grade fertilizers too late.

In California, on alkaline soils or soils having alkaline tendencies, apply Nitrate of Soda with an equal quantity of acid or superphosphate. This combination will tend to diminish any black alkali present.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS, MARCH 21, 1916.

of California Cultivator, published weekly at Los Angeles, Cal., for April 1, 1920.

STATE OF CALIFORNIA,
County of Los Angeles, ss.

Before me, a Notary Public in and for the State and County aforesaid, personally appeared Frank H. Thomas, who, having been duly sworn according to law, deposes and says that he is the publisher and business manager of the California Cultivator and that the following is to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse side of this form, to-wit:

1. That the names and addresses of the publisher, editor, managing editor, and business manager are:

NAME OF—	POST OFFICE ADDRESS
Publisher, Cultivator Publishing Co.,	Los Angeles, Cal.
Editor, C. B. Messenger,	Los Angeles, Cal.
Managing Editor,	
Business Manager, Frank H. Thomas,	Los Angeles, Cal.

2. That the owners are (Give names and addresses of individual owners, or, if a corporation, give its name and the names and addresses of stockholders owning or holding one per cent or more of the total amount of stock).

Cultivator Publishing Co.,	Los Angeles, Cal.
Frank H. Thomas,	Los Angeles, Cal.
R. M. Teague,	San Dimas, Cal.

3. That the known bondholders, mortgagees, and other security holders owning or holding one per cent or more of total amount of bonds, mortgages, or other securities, are: (If there are none, so state).

None.

4. That the paragraphs next above, giving names of owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholders or security holders appear upon the books of the company as trustees or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities as so stated by him.

5. That the average number of copies of each issue of this publication sold or distributed, through the mails or otherwise, to paid subscribers during the six months preceding the date shown above is ——. (This information is required from daily publications only.)

FRANK H. THOMAS, Manager.

Sworn to and subscribed before me this 31st day of March, 1920.

(SEAL.) ROBERT WHITFIELD.

Simplex Silos Are Scientifically Correct

To Ranch Owners,
Everywhere.

Gentlemen:

Briefly, this year's feed situation is summed up in the following three short paragraphs taken from the California Cultivator for March 13, 1920:

"Twist or turn as we will and develop water from every possible source, this will be a dry summer. Presumably there will be less alfalfa, and although the recent rains have assured many a hay field, there will still be a shortage of grain hay. Millions of California livestock, while not actually hungry, may not put on as plentiful streaks of fat as the consumer desires.

"But the situation may be helped very materially by planting more soiling crops and more sorghums or other large grasses for pasturage and for silage. We predict there will be a greater building of silos than any preceding year.

"It is none too early to have plans taking definite shape. Let it be a pit in the ground, let it be built of brick, of concrete, or wood or of iron; but let it be something to hold feed to take the place of $40 hay. Even some of the weeds make excellent silage. First alfalfa cutting with a liberal sprinkling of foxtail has been declared one of the best of our silage crops."

In view of the above your attention is invited to the "Simplex" Silo. The "Simplex" is made air tight by the use of one-piece staves the entire height of the silo, thus eliminating splicing and end joints. The clear Oregon Pine (Douglas Fir) gives it an inner surface smooth and perpendicular. The Crissel Tangent Top, patented Interlocking Anchorage System, and sturdy steel hoops, is a triple assurance of strength and stability.

These are fundamental features of the silo. Nearly every silo has one of them. But because the "Simplex" has all of them, agricultural experts have pronounced it scientifically correct.

It is just as easy to own a "Simplex" as any other kind of silo; but on account of the big demand which will be even greater this year, you are urged to let us hear from you at once.

SANTA FE LUMBER COMPANY,
16 California St., Dept. A, San Francisco, California.

Please send me folder describing Simplex Silos; also information about Papec Ensilage Cutters.

Urges That Mares be Bred

The best thing a farmer can do this spring is to breed his good mares to a first class stallion, says Wayne Dinsmore, secretary of the newly formed Horse Association of America,

"Because: The demand and price for good horses and mules is increasing in cities; farm demand is improving; there is a shortage of good horses and mules of all kinds.

"City trade is improving because transportation users of all kinds have discovered after years of experience that horses furnish the cheapest source of power on short hauls. On this Harry Vickers, president of the Fuel Cartage Company of Chicago, says:

" 'There is work today that the horse can not do—long distance hauling with rapid transportation—but the motor can never take the place of the horse because the horse can do the work on short hauls just as rapidly and at a lessened cost of 25 to 40 cents on the dollar. Conscquently we never allow a truck to displace a team. We will buy a truck to do the work that a horse can not do, but we don't send a truck to do the work that a horse can do. It would be like having a dollar and throwing away 40 cents.'

"Of the farm demand W. S. Corsa says: 'Farmers are determined bidders in country sales and prices for good horses have gone up $35 a head in the last 30 days, while mules are bringing from $800 to $1,000 a pair.'

"Of the shortage W. T. McGreavy of the McGreavy Transfer Company, Minneapolis, says: 'What we teaming contractors want is good horses. We don't want scrubs, light of weight, incapable of hard work and selling cheap. We want horses that will weigh 1,700 pounds or more and we are willing to pay for them. A teaming contractor in this city paid $800 for a pair of five year olds yestcrday that weighed 3,200 pounds. The big trouble is that the farmer expects us to pay a high price for a green horse, one that is liable to distemper and isn't properly broke. The buyer of such a horse is taking a big chance that he'll die or be laid up and, consequently, won't pay as much for him. Give us good, sound, big horses with a little experience behind them. We can't get enough of them and the demand will never run out.'

"Claims of truck and tractor manufacturers that horses and mules are destined soon to disappear are very properly met with the query, 'Why should horses and mules, which according to your views, are obsolete and destined to speedy disappearance, be in greater demand and at higher prices than ever?' "

Arizona Range Problems

Just now the main problems with regard to range management in Arizona, says Dr. R. H. Williams, animal husbandman, University of Arizona, according to their greatest interest may be named as follows:

More Range

In the past the stockmen have been crowding each other. New men have come into the country and the crowding has gradually continued. Three years ago we began an active land leasing and purchasing movement in Arizona. Some of the old time outfits that were a little conservative and refused to buy land or lease it have found that their range has slipped away. Active steps must be taken for them to stay in the business. The value of ranges nas gone up until now there is a commercial valuation of $15 to $50 for the range that will carry one cow and about from $5 to $8 for the range that will carry a sheep. For the most part these ranges are not deeded property, but with some land that is owned outright. The most strategic locations have been taken, either by purchase or lease and as much additional range as possible secured on the public domains, national forests and Indian reservations. The situation has become extremely accute, for there is an active demand for more range. The cure for the range problem is that of increasing the carrying capacity of our present ranges.

Increasing Carrying Capacity

In the early days grass was hip high and could be found almost anywhere in the Southwest. At the end of the dry period commencing the first day of July, 1919, there was little or no grass in Southern Arizona. The ground had been denuded of virtually all palatable vegetation. Last summer and fall and this winter the rains have been extremely abundant in this country and the palatable grasses have come ahead rapidly. In places around water tanks and over-grazed pastures and other places where it was believed all vegetation had been killed out, tbe perennial grasses came in last summer, making a good growth. This just goes to show that our palatable grasses are very resistant and will grow whenever given an opportunity. A summer like last year would do more for reestablishing and increasing the carrying capacity of Arizona ranges than three like the preceding.

Certainly ever nook and corner in Arizona has been occupied by stockmen and the only way that we can increase the number of animals that can be maintained is to handle our ranges properly and increase their carrying capacity. This can be very easily done. Thus, in 1903 when the Santa Rita range reserve was fenced a cow would starve on 100 acres. For the past few years this range has carried one head to an average of 22 acres. During this time it has been extremely dry. The surrounding neighbors have lost cattle, but mighty few have died inside of the reservation. The calf crop inside of the reserve has been increased greatly over that secured on surrounding ranges and last year they sold their calves at $5 a head more than other outfits in the district. The proper management of the ranges we have in Arizona will easily make it possible to double the number we can maintain in the state.

Improved Breeding

When a man has secured control of a large area of range and has improved its carrying capacity, the next consideration is how to secure and maintain and utilize every bit of grass that grows. The first consideration in this work is to make certain that only the most profitable animals are used. It is a crime to maintain a Mexican steer that can hardly be sold as a yearling even at a reduced price, but must be maintained until it is two years old and then receive only as much for it as a well bred yearling would bring. Buyers of cattle from the Northwest and other districts receiving Southwestern stock are becoming more and more discriminating. It is impossible for some of the outfits that have refused to breed up and improve to sell their calves or yearlings. In the future yearlings will be bought according to their outcome and every herd will be known according to the quality of its cattle. The stock will be sold by weight and improved breeding on better ranges will do wonders to increase the financial yields secured in the business. Many other phases of the range management may be mentioned. One of the most important is a system of managing the animals on a range; supplementary crops for ranges, and feeding range cows to tide them over the periods of drouth.

ROOTS MAKE MILK

Roots are among the best feeds for dairy cattle and fortunate is that dairyman who has a plentiful supply, according to Profcssor H. P. Davis of the department of dairy husbandry, University of Idaho. While they are watery, roots should be classed as watery concentrates rather than as roughage. In analysis they are high in carbohydrates and low in protein. The dry matter that they contain is very valuable and will give as good results as grain pound for pound.

Ease of digestion is an important

THE BEST LINIMENT

The LAWRENCE-WILLIAMS COMPANY, Cleveland, O.

Purebred Holstein Cows Yield Five Times More

In the opinion of Supt. Smith of the Geneva Experimental Station, the average production of butterfat per year per cow in New York state is about 100 lbs. The State College at Ithaca has a cow descended from common stock on one side and from a line of pure bred Holstein sires on the other. This cow has produced 479 lbs. of fat in a year. Not a startling record as several purebred Holsteins have records of more than twice as much, but it is interesting as proof that intelligent improvement of a herd of grades can multiply the butter yield by four and five.

The advertisers in the California Cultivator are known to be reliable and we recommend them to our many subscribers.

reason why root crops are so valuable and, compared with corn silage, they are almost one-third more digestible. Besides the feeding value and the ease of digestion, roots furnish succulence in almost ideal form. In this respect they rank ahead of silage and are to be preferred to that crop if available.

Not the least important value of roots is the tonic effect upon animals. This can be noted on all classes of animals, but it applies with perhaps the greatest force to dairy cows. With plenty of beets in the ration a dairyman has much less to fear from a cow going off feed even when she is fed large quantities of grain.

As to the feeding of roots to dairy cows, the usual ration varies from 25 to 50 pounds per 1,000 pounds of live weight, although larger quantities are frequently fed. Before feeding, the roots are sliced in a root chopper or are cut by hand. Almost any kind of roots can be used successfully with cows, but red beets, sugar beets, mangels and carrots are more largely used. Turnips or rutabagas, because of their strong flavor, often taint the milk, and when used should be fed immediately after milking.

Where roots can be grown without too much cost, they furnish a very desirable addition to the dairy cow ration and there can be no doubt that larger milk yields will result when they are fed.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Boulevard, Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Unsigned communications receive no attention.

Eczema on Udder

I have a large five year old cow that has eczema on her udder and hind legs. What is best to give her to thoroughly cleanse her blood?—Subscriber, Fillmore.

This may be a case of cow pox, but in any case of eruption on the skin it is safe to give salts to cleanse the blood. Mix three pounds of epsom salts, two pounds of common salt, four ounces of powdered gentian and two ounces of powdered nux vomica. Of this mixture give a handful in the feed once a day while it lasts. For outward treatment we would advise using a lotion of permanganate of potash, enough to make the water a deep red. Apply the lotion once a day all over the surface as far as the eczema extends. To prevent conveying the disease to other cows the milker should wash thoroughly before going near another cow and it would also be best to milk this cow last.

Hog Paralyzed

I have a gilt that has been paralyzed for over two months. She does not seem to be in any pain but can not use her legs to get up. She eats well and farrowed ten pigs a month after she became this way. We let her keep five of the pigs which seem to be doing fairly well. Have been feeding bran and middlings as a wet mash. Have also given her two kinds of condition powders but notice no improvement. Is it worth while keeping her?—Subscriber, Wasco.

After so long time it is doubtful if she recovers. However, you might try this. Dissolve half a dram of iodide of potash and one grain of strychnia in eight ounces of water. Give a teaspoon of the mixture in the feed twice a day. Also keep her in the sunshine as much as possible but not exposed to the cold or dampness.

Lumps on Udder

I have a heifer coming fresh in about two months. She is just making bag now. On the side of her udder is a cluster of lumps about the size of marbles. They are soft and have a slight purplish color. They grow as the udder grows. I would like to know what it is and what remedy to apply. —Subscriber, Wright.

They may be warts. Open them and if they are solid inside cut them out, leaving as much of the skin as is not involved in the growth. If they just contain liquid they will not need cutting out. Dress the wounds with a solution of permanganate of potash, using one dram to the pint of water. Use a swab and apply the lotion once or twice a day.

Injured Hoof

Have a horse that was badly cut in the hoof by wire fence two years ago. It is the right frout foot. The horse was thrown over the wire and dragged 20 feet or more. The foot bled terribly when cut. The wound healed but the foot does not harden. It keeps cracking around the hoof when I ride him. What will harden the hoof?—Subscriber, Lincoln.

Probably the coronary band around the top of the hoof, from which the hoof grows, has been destroyed or injured so it does not secrete the hoof properly. Try this. Mix four parts vaseline and one part pine tar. Melt them together. Use the ointment freely around the top of the hoof. Keep the hoof pared so the foot will stand straight.

RULES FOR SHIPPING FURS

First see that your furs are properly packed and your bundle securely wrapped. Remember to put your name and address on a card inside your bundle; then if the tag on the outside is accidentally torn loose or the writing blurred there will still be some clue to the owner of the furs.

Address Tag Plainly

Write your name and address on the outer tag plainly or, if necessary, print it, and of course include the name and address of the fur house to which you are sending your furs. Some large fur houses furnish special shipping tags free to trappers for their convenience in shipping.

Saving Shipping Costs

There are many little ways you can save shipping expense. For instance, always cut off opossum tails and muskrat tails from your furs, as they have absolutely no value and only add to the weight. Remember, too, to remove all surplus fat and flesh from the hides, as it is just extra weight and may start to decay at any time.

When you ship furs in a box or barrel you pay charges on a lot of worthless wood. Burlap will answer the same purpose, and even if you have to buy it, will be cheaper in the end.

Don't Ship by Freight

You should never ship furs by freight. The best way is to send them either by express or insured parcel post and always get a receipt. Make sure that all bundles sent by insured parcel post are not sewed or sealed, as they must be open to the inspection of the postal authorities. Usually a parcel post bundle should not exceed 50 pounds. In the first and second zones, however, 70 pounds can be placed in one package.

Mail shipments of furs are becoming more and more popular and in most cases have proved just as safe and as quick as express. Besides, they are much more convenient.

Send Special Instructions

If you have any particular instructions to make to the fur house regarding your shipment, they should be sent with the bundle. If you are expressing, put your letter of instructions inside the bundle. If you are sending by mail, place your letter in an addressed envelope and attach it to the outside, but be sure the letter carries first class postage.

If your furs are prepared right, packed right and shipped right, they are sure to arrive at the fur house in first class shape and merit the best grading.

Cotton planting in the Salt River Valley of Arizona has been delayed somewhat owing to cool weather, nevertheless a large proportion of the acreage will be planted by the first of April.

Order Early Your 1920
DE LAVAL
CREAM SEPARATOR

Farmers in need of a new De Laval Cream Separator this year may wisely place their orders immediately if they have not already done so.

For three years past, notwithstanding the constantly increased production, it has not been possible to make nearly enough De Laval machines to meet the demand. We shall make 25,000 more machines in 1920 than in any prior year, but are already behind deliveries in some sizes. Hence the importance of getting in your order early.

Superior as De Laval Cream Separators have always been to other separators, they are better still in 1920.

If you have milk to separate you can't afford to waste quantity or quality of product, time and convenience, through the use of any other means of separating than a De Laval machine.

An improved De Laval Separator will surely save its cost in a few months, and will go on doing so every few months for many years.

De Laval Separators speak for themselves. Their appearance and performance best demonstrate their superiority. Be sure you see and try one before buying any other or deciding to go on using an inferior or half-worn-out separator another year.

Your De Laval local agent will be glad to afford you the opportunity to do this. If you don't know him simply address the nearest De Laval main office, as below.

Tulare's Best Consignment Sale

65--Registered Holsteins--65

Unquestionably the best offering of registered Holsteins ever made at Tulare in a consignment sale will go under the hammer at

Tulare Sale Pavilion, Tulare, Cal.

Thursday, May 6, 1920

R. C. STURGEON, Tulare, sells his entire milking herd and some choice heifers, many with high records, and all of breeding age in calf to SEGIS PONTIAC ABBEKERK, 35 lb. son of Segis Pontiac De Kol Burke.

R. F. GUERIN, Visalia, will offer one of the very best consignments he ever made to any sale, including a great 28 lb. cow, a 25 lb. cow that has a 24 lb. 2 year old daughter, three granddaughters of King Korndyke Sadie Vale, and others of excellent breeding, all bred to King Sadie Vale Idyl Segis, whose dam is a 35 lb. daughter of King of the Pontiacs.

ALEX WHALEY, Tulare, sells two beautiful heifers, one of them a daughter of the three times grand champion bull King Segis Alcartra Prilly, both of them bred to Sir Aaggie De Kol Acme 2nd, five of whose seven nearest dams average 1154 lbs. butter in one year.

THE VICTORY HERD, H. E. Spires, Caruthers, will offer four excellent females bred to SIR PIEBE DE KOL SEGIS PONTIAC, son of the famous King Segis Pontiac Count, and whose first daughter to freshen as a 3 year old has made the Kansas record for any age of over 33 lbs. butter from 699 lbs. milk in 7 days.

LES McCRACKEN, Ripon, sells ten open heifers, most of them ready to breed, all of them of excellent breeding, including several granddaughters of Colantha Johanna Lad.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER;
EVERY ANIMAL OVER SIX MONTHS OLD TUBERCULIN TESTED
AND SOLD SUBJECT TO RETEST BY THE BUYER.

GET MORE EGGS.

"Lady Victory"

1918 Champion laid 304 eggs in 365 days. Highest official record of any living hen. She laid 25 eggs in Jan., 27 in Feb., 29 in March.

Milkoline **will help make your hens lay more eggs.**

Feeding Milkoline

will make you more money —reduce mortality of your flock— keep flock healthy and less liable to disease.

Increase Poultry Profits Any poultry raiser can easily double his profits by doubling his egg production. Feeding **Milkoline** with other feed greatly assists assimilation, keeps digestive organs vigorous and is a wonderful appetizer, tonic and bowel regulator. **Milkoline** contains nutritive elements vital to egg production and not found in grain rations.

13,000 More Eggs

Jas. E. Keyes, Petaluma, Calif., says: "After feeding **Milkoline** for eighteen months to 2,500 hens, I find that worms cannot exist in poultry where **Milkoline** is used. I redneed mortality with laying hens 10 per cent. I increased the egg production of my flock **thirteen thousand eggs** in one year. Feeding **Milkoline** to laying hens keeps them in splendid health thereby preventing disease and derangements of all kinds."

Lowers Feeding Cost

Many feeders say **Milkoline** lowers feeding cost one-third, because their hens assimilate all feed they eat. Our liberal **Guarsnteed 30 Day Trial Offer** enables you to try **Milkoline** at our risk—to prove that it will make you mighty good money.

Milkoline

has a base of modified buttermilk with essential fats and acids added. **Milkoline** comes in condensed form. Will not monld, rot or sour. Keeps indefinitely in any climate. **Milkoline** is simply **"Good Buttermilk Made Better for Feeding."** Flies don't bother it.

Prevents Disease

Milkoline is not featured as a cure for anything or a preventative, hut due to the acidity in the buttermilk it is a germ destroyer and helps keep poultry healthy, which is the hest preventative against disease. **Milkoline** is invaluable as a life saver for baby chicks.

PRICES

These prices are F.O.B. Kansas City or the address of our nearest dealer. Dealers in all parts of the United States.

5 Gal. Keg	$7.50
10 Gal. Keg	12.50
15 Gal. Keg	16.50
32 Gal. Barrel	32.00
55 Gal. Barrel	49.50

Prices on smaller packages given in booklet. Buy in barrel lots—it saves you money.

Only 2c a Gallon For feeding mix one part of **Milkoline** to 50 parts of water (small feeding 5 tablespoons to gallon of water). Feed either with water or mash feed. **Milkoline** keeps their appetite keen and its action is highly essential to normal egg production. When fed as directed **Milkoline costs only 2c a gallon** or less. Trauhaft & Newman, Lankershim, Calif., say: "We would not go back feeding straight buttermilk at any price."

Guaranteed Trial Offer **Milkoline** has been producing so many amazing results and we are so certain of what it will do for you that we will ship you 1 Gallon for $2.25, **express prepaid.** Take 30 days—feed half to your poultry. If not entirely satisfied simply return unused portion and we will refund every cent you paid us. No charge for portion you have used. **Milkoline** is legally guaranteed to he satisfactory. You are always the judge. We suggest ordering larger quantity—you get the benefit of lower price—you risk nothing—you must he satisfied or we refund every cent you paid us. **Make thie test now.** The sooner you begin using **Milkoline** the quicker you will be making money.

Feeding the Little Turkeys

By Jean A. Koethen

EVERY turkey farmer has his or her own method of feeding poults, and none of these methods is guaranteed to suit all cases. The raising of little turkeys seems to be something of a gambie at the best. You feed them in the same way year after year and think you have turkey raising down pat; then comes a bad year and they die in spite of the most exacting care. To be sure, these untimely deaths can always be laid to the weather or to weakness of the breed ing stock, but the truth is the poult has a very delicate digestion, and the perfect ration, guaranteed to raise every poult under all conditions, has not been found.

The best we can do is to imitate nature. The turkey mother, when left to herself, feeds her charges very little, and that little consists mainly of greens and animal food (bugs, worms, and later grasshoppers), with a lot of sand and grit to digest it. On good range a turkey mother will care for her babies without assistance and bring them up to a healthy vigorous maturity. If we can arrive at her methods and follow her example, we shall be more likely to succeed.

Not What But How Much

The experts of the Rhode Island station, who have done more work with turkeys than any other investigators, insist that it is not what is fed but how much that counts. They have adopted what they cail the time basis of feeding, limiting the amount fed at any one time to what can be consumed in two or three minutes and removing the trays at the end of the period, no matter how the poults beg for more, and they are quite emphatic in asserting that this is the real crux of the matter. To quote from Extension Bulletin No. 2: "As previously pointed out, we are probably not yet in a position to state that one food is essentiaily better than another for poults that are on range. Vigorous flocks have been raised on corn meal alone, while equally good flocks on a neighboring farm have never tasted it; and on another the sole ration for the young birds is bread and milk which gave equal success. In none of these instances is it the kind of food that counts so much as the manner and amount in which it is fed as a supplement to the food obtained on the range. The successful turkey raisers of the present day—and they are few in number—are those who understand the feeding of turkeys from the quantitative point of view—who have succeeded in adapting a certain method of supplementary feeding to the conditions existing on their particuiiar range."

This statement, it is evident, applies only to range fed birds. If your turkeys must be raised in confinement there is nothing in it for you. If you have range, then the first thing you have to do is to study its possibiilties and balance the food the poults get for themseives with what you give them. That is, if the range is rich in animal food, but without grain or seeds, the supplementary feed must contain grain but may perhaps be altogether lacking in animal food. This station has no advice to offer as to the feeding of pouits in confinement. For that we must go elsewhere.

Rhode Island Ration

Bearing in mind the fact that it is intended only to supplement range feeding, let us examine the Rhode Island method. The coops are ranged along the side of a fieid where the poults find abundant range as soon as they are oid enough for it.

The first meal is given when the poults are from 50 to 60 hours old and consists of about two teaspoons of finely chopped boiied egg and dandelion or lettuce, haif and half, for 12 to 14 poults. The trays are left before the birds for from five to seven minutes and then removed. The mothers have previousiy been given each a handful of whole corn, but they aiso share the pouits' meal.

At eleven o'ciock the same feeding is repeated, and after it a handful of whoie corn is given the mothers.

At two o'ciock the pouitryman comes again, this time with trays of stale bread thoroughly soaked in sweet miik. At five he comes for the iast time, bringing another two teaspoons of egg and green.

Next morning the poults again get their two teaspoons of boiled egg and green (iettuce or dandelion), but with a little roiled oats added to the mixture. At 11 o'ciock they receive two teaspoons of chick grain; at 2, bread and milk, and at five the egg mixture again. They are now fairiy broken in to five different kinds of feed, egg, greens, bread and miik, roiled oats and chick grain, and it is part of the system of the station to keep up this variety ration.

The third day's feeding is like that of the second. On the fourth day the poultryman comes in the morning, at noon, and at 4:30, omitting the 11 o'ciock meal. One meal consists of the egg mixture, one of chick grain and one of bread and milk. From this time on the birds are never fed more than three times a day and the meal may consist of any of the feeds already given or occasionaily of only a handful of dry rolled oats.

At the end of the first week time feeding begins. The trays are left before the birds three minutes and no longer, sometimes not so iong.

After ten or 12 days the egg mixture is omitted and the ration limited to chick grain, rolled oats, green feed and bread and milk, but always the time limit of three minutes for the meal is observed. On stormy days when the poults are confined to the coop they are fed lightiy four times instead of three, to make up for the lack of range.

Sour milk is not fed till the end of the third week. At first a quart of clabbered miik morning and night is aliowed for every 35 or 40 poults (inciuding the mother hens). Later the amount is increased gradually to a quart for 20 birds.

During the second month the ration is not materially changed. Rolled oats are fed, chopped with an equal amount of green feed, such as onion tops, lettuce, dandelion, etc. Green feed is always given liberally. Chick grain and bread and milk (sour or sweet) completes the ration. It is during this month that blackhead is most likely to develop, and the greatest care is taken to prevent overeating. As the birds are on range their ration may be cut down to two meals a day and each meal limited to two or three minutes.

The only test of the sufficiency of the ration is the behavior of the poults themselves. If they come clamoring, ravenously hungry, every time the caretaker appears, they are not being overfed. Whenever they seem less eager for food something is wrong, and in most cases it is that they have been overfed.

For Confined Poults

Mrs. E. B. Martin has been very successfui in raising turkeys in confinement. After they hatch they are given nothing but grit for 72 hours. At the end of this time they are given a fountain filled with sour milk, and some time the fourth day real feeding begins. The nursery feed, which is continued with siight change for six weeks, consists of hardboiied egg, chard or lettuce, and onion, all chopped fine and mixed with a littie sand or grit. Two onions, a couple of handfuls of chard and one egg, making in all what wouid fiil a quart measure, is a sufficient meal for 100 poults This is fed twice a day on a board or tray and at noon the birds have aii the cottage cheese they will eat. They are never fed more than three times a day, but as they grow older the amount fed is gradualiy increased and the amount of egg in the mixture is also increased. No grain of any kind, no bread or cereal food, is given tiil the poults are about six weeks oid.

When eggs cannot be spared, a littie beef scrap is sprinkled over the chopped green. Mrs. Martin beileves that poults cannot digest starch when tiey are very young and that their diet must consist absoiutely of greens and animal food untii their digestive organs can bear starch. Corn she considers

Correspondence with the advertisers in the California Cultivator will convince you that their articles will save you money.

absolutely fatal. Once a day charcoal is added to the mixture. Onion is never omitted. It may be young onions or old, or onion tops, but they get onion in some form at every meal.

Some time between the fourth and sixth week, the poults get their first grain. A very small amount of rolled breakfast oats is added to the mixture of egg and greens which has so far been their main ration. The amount of rolled oats is increased and the amount of egg diminished till, by the end of the third month, the ration consists of rolled oats and chopped greens.

After the third month, by which time the birds have "shot the red," the turkeys are gradually weaned to a feeding of barley at night. No corn is given during the summer. They also have, during the second three months, a mash of bran, beef scrap and charcoal constantly before them. This, with all the green they will eat, and the night feed of barley, is their ration up to the time when fattening begins in October.

Keep Them Hungry

The important thing in feeding very young turkeys, all experts agree, is to keep them hungry. Whether this is done by limiting them to two or three minutes to a meal or by feeding out of the hand, as is easily done with a few, taking care that they are as ravenous at the end of the meal as at the beginning, does not matter. I used to feed a teaspoonful to ten turkeys at the start, and the mother got some of that. We used to be given the rule, "Feed little and often," now we are told to feed little and not often. The amount given at a meal should be increased with great caution, for, while the larger turkeys require more, they are getting more for themselves, if they have any range at all.

Poultry Queries

Conducted by J. A. Koethen

Soft Droppings

The droppings of some of my hens are soft and yellowish or brownish. I feed milo, wheat, a commercial egg mash and an abundance of greens. My rabbit hutches are in the same yard and I notice the hens are constantly underneath them picking. Is it possible that this is affecting the droppings?—J. N. M., San Diego.

As I have had no experience with rabbits, I do not know what the hens are picking up under the hutches, but I think it much more likely that the soft droppings are due to too much beef scrap in the mash. Many persons who use these commercial mashes dilute them with an equal quantity of bran. Better try this plan for a short time, or you might give the hens plain bran for a week, then put them on the diluted mash. Hens have a good deal of intelligence about eating things they should not have, but it is better not to keep them in the same yard with rabbits or ducks.

Hens and Barley

On one side of my henhouse is a field planted to barley which is now three inches long. If I turn the hens on now will they kill the barley? If I wait till the grain is longer is there any danger that the long blades will cause cropbound? I lost two hens recently with that trouble, in spite of the fact that I followed the directions in "Poultry for Profit."—Subscriber, San Diego.

It is astonishing how quickly a flock of 75 hens will make a field of young barley look like 30 cents. Better wait till the barley is at least six inches long. The hens will not fill their crops with the long blades, they nibble them off. Those directions for operating on crop bound hens were written by a surgeon, I suspect, and are not easily followed by an amateur. Sometimes it is possible to empty the crop by means of massage and to wash it out with a syringe. If this fails, an operation is the only cure, but it should be undertaken only as a last resort.

Purchasing Cockerels

What time of the year should I purchase a White Leghorn cockerel to mate to pullets hatched in March? I shall not need him till next February. Is it necessary to order him now?—Subscriber, Antelope Valley.

October or November is ample time for purchasing a cockerel for next year's use, and you do not need to order him beforehand. There is never a shortage of cockerels.

Paralysis or Rheumatism?

I have a hen that seems to be paralyzed in both legs. Her comb is red, and she eats when I hold her up. Is there any remedy?—Subscriber, San Diego.

The hen's legs may be paralyzed because of some pressure due to constipation, indigestion or an egg that she is unable to lay, or the trouble may be rheumatism, which is always caused by dampness in house or run. In either case a dose of Epsom salts (one-half teaspoon in moist mash) and a liberal feeding of greens is in order. Keep her in a warm, sunny place. If warmth, physic, and greens do not soon improve her condition, better kill her.

RHODE ISLAND WHITES

By M. E. Bemis

Rhode Island Whites have been making records in the egg laying contests of the country since 1914. In 1917 a 291 egg hen was produced in the All-Northwest egg laying contest at Portland, Oregon. Last year in this same contest they made the best breed average, and at the national egg laying contest at Mountain Grove, Missouri, they broke all previous egg records. The two leading pens were Rhode Island Whites, one pen of five birds laying 1,217 eggs, or an average of 243.4 eggs. The second pen averaged 233 eggs. The leading pen in the contest, also a Rhode Island White, laid 306 eggs for the year.

Rhode Island Whites in the show room are attracting more and more attention each season. This popular breed is backed by one of the strongest specialty clubs in the country.

The 1920 year book of the Rhode Island White Club of America has just been issued and may be obtained of the secretary, H. E. Caldwell of Canutillo, Texas. The price, 25 cents. Anyone desiring any information regarding this breed should write to the secretary.

THE CARE OF HATCHING EGGS

Hatching eggs should be taken from the nest as soon as possible after they are laid, lest they be chilled or the germ begin to develop under a broody hen.

Keep them in a room where the temperature is around 50 degrees and turn every day. Some poultrymen keep their hatching eggs in wire racks with the large end up, but this is not necessary. It is advisable, however, that they be laid out side by side on a plate or in a pan, and not piled one upon the other. After eggs have been shipped it is a good plan to let them lie quietly for a day before putting them under the hen.

The sooner an egg is under the hen or in the incubator the better. An egg under a week old is more likely to hatch a good, strong, livable chick than one over a week old. Two weeks is the very limit of time to which an egg should be kept, and ten days is better. There seems little doubt that many of the failures of eggs to hatch are due to the fact that the germ was already weakened by time before incubation began.

Hatching eggs should not be kept where a drying wind will strike them nor in a kitchen where there is a good deal of steam, nor should they be washed. The room in which they are kept should be dry, cool, and well ventilated.—J. A. K.

Strawberries: Imp. cr., 4.50@5.00.

CITRUS

Box: Lemons, fancy, 4.50@5.00; choice, 3.00@3.75; standards, 2.50@3.00; lemonettes, fancy, 3.00@3.50; others, 2.00@2.50. grapefruit, fancy, 2.50@3.00; choice, 2.00@2.50; oranges, navel, 3.00@6.25; limes, 1.00@1.50 crate; tangerines, 1.50@3.25 per crate.

RICE

The California market is unchanged, some sales being consummated at $11.85 for fancy. Fancy generally is being quoted from $12 to $12.20 for spot and futures; choice 25 cents less. There is good demand for brewers and screenings, but practically no stock available.

BEANS

Jobbing price per cwt.: Small white, 6.20@6.25; large white, 6.00@6.35; cranberry, 6.90@7.00; red Mexican, 7.75@8.50; pink, 6.35@6.50; California Bayo, 9.25@9.50; blackeye, 7.10@7.25; red kidney, 13.00@13.25; lima, 11.00@11.25; Garvanza, 9.00@9.50; Kotenashis (in bond), old crop, 5.25; new crop, 5.75.
Dried Peas—California, 5.25@5.50 per cental for green, recleaned.

HOPS

1919 crop, 70@85c per lb.; older growth, 45@55 per lb.; prices to growers for 1920 crop, 50@65 per lb.

HAY

Under date of April 3, Scott-Magner & Miller says:
Market continues dull and arrivals unusually light. Oregon cheat and Nevada alfalfa make up the bulk of the city receipts and what little trading goes on here is being done in these two latter commodities. Interior demand has been a little better than last week. Reports on weather conditions are not so favorable this week, the cold north winds have been bad for both pasturage and stock and have created a moderate demand in sections that were anticipating getting along with the growing grass for a while.
We quote today wholesale prices in carload lots as appear from dealer's transfers upon the hay market in San Francisco, for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat hay (light 5 wire bales)	38.00@41.00
No. 1 Wheat or Wheat and Oat hay	35.00@38.00
No. 2 Wheat or Wheat and Oat hay	33.00@35.00
Choice Tame Oat hay	37.00@40.00
Other Tame Oat hay	33.00@37.00
Wild Oat hay	Nominal
Barley hay	Nominal
Alfalfa hay	32.00@37.00
Stock hay	29.00@32.00
Oregon Cheat and Oat mixed	29.00@32.00
No. 1 Barley straw, bale	70@1.00

Citrus Markets

Los Angeles, April 7, 1920.

A heavy run of large sizes is still somewhat embarrassing the market but demand for regulars continues steady. As an indication of the demand f. o. b. California quotations on large offs are around $2.75 while 150's and smaller are commanding around $5.

Large supplies of foreign lemons are in port unsold and still larger quantities afloat. Shipments of Californias are being reduced.

Shipments

Shipments of citrus fruit to date from Southern California since November 1, 1919: Oranges, 13,617 cars; lemons, 2,653; total, 16,270. To same date last season: Oranges, 14,232; lemons, 3,344; total, 17,576. From Central California this season: Oranges, 3,751; lemons, 279; total, 4,030. To same date last season: Oranges, 2,289; lemons, 251; total, 2,540. From Northern California this season: Oranges, 260; lemons, 20; total, 280. To same date last season: Oranges, 234.

"Like a Friend Who Goes Out of His Way for You"

That is the way a Mohawk user recently characterized the Mohawk tire.

It is just a sample of the way Mohawk owners, the country over, feel about Mohawk tires. What this saying means is, of course, that the owner of Mohawk tires is getting more than he expected.

For seven years, Mohawk tires have been giving mileage consistently greater than the average tire user is used to.

The reason Mohawks really *do* surprise automobile owners with greater mileage is because they are honestly and sincerely built.

The purest rubber is only used in them. No shoddy, reclaimed rubber—no glue, rosin or any other "filler."

They contain the strongest fabric made from the toughest cotton produced—and in most sizes an extra ply of fabric

They are hand-made by expert builders—no machine processes, because *every* Mohawk must be *right*.

If you like people "who go out of their way for you"—if you believe they are worth knowing and worth keeping as friends—you will, in the same way, like Mohawks. Of those who have used them, records prove that 85% will use no other tire.

Can You Lift a Ton?

THE Glenn County farm bureau is issuing a weekly market bulletin which manifests considerable real life. It is giving information as to buying and selling prices and under the title "Economy" presents some very forceful lessons as to the advantages of cooperation. The bulletin says:

Cooperation spells economy. If it did not, there would be no reason for our existence. The country's present wasteful system of selling its products, and more wasteful system of buying its needs, has been the natural outgrowth of individual buying and selling on a credit basis. In place of collective thinking and individual buying, as in the past, we must have individual thinking and collective or cooperative buying.

Farmers calling on dealers for their needs expect the dealer to have a stock of goods to satisfy their every whim. They have not anticipated their needs and dealers have had to buy more or less blindly. The time of the dealer and his clerks is taken up in finally making a selection. Dealers are expected to have a creditable display room for which a high rental is paid. They pay high wages to their clerks. The farmer has come to expect the dealer's salesman to call on him, in company with a highly paid factory representative, or alone. All these men must be paid and the expenses incurred must be included in the final prices paid by the farmer.

When the farmer has bought from his dealer, he has asked for credit. The dealer in turn must ask credit from his jobber, and the jobber from his manufacturer.

Manufacturers, like farmers, prefer cash for their products and make their lowest prices only to jobbers who pay cash. Jobbers likewise charge more to dealers who do not pay cash. And the dealer must add all these additional expenses to the legitimate price for which the manufactured article should be sold to the farmer. Yet none of these agencies make exorbitant profits. The farmer pays for the system, for which he is in part responsible.

Cooperative movements must avoid this wasteful procedure if the members are to be benefited. Members must cooperate to the extent of anticipating their needs. By communicating these needs to their cooperative agent, he can lump the requirements of many farmers in one order to the jobber or direct to the manufacturer. The jobber, knowing that these goods will be paid for promptly on arrival, bills them at the lowest prices. With cash in hand he buys from the manufacturer at the lowest price and the saving is effected all along the line.

True cooperating requires the eliminating of useless expense. Standard articles of national reputation and proven merit, sold under a guarantee of satisfaction, can be safely purchased through your cooperative agent. No frills and little sales expense will leave more of your hard earned dollars where they belong—in the pockets of the producers.

Can You Lift a Ton by Yourself?

Command profitable prices by better farms, better farming and loyalty.

Cooperation is profitable for the farmer because:

1. It enables him to buy his farm supplies at wholesale. One man cannot lift a ton without some machinery, but 20 men can do it easily by lifting together. The purchasing power of 20 men used at one time and on one article is many times greater than the power of one man at 20 times or on 20 articles. Farmers are manufacturers. They should buy all raw materials, feeds, seeds, fertilizers, machinery, etc., at wholesale rates. Until they cooperate they buy at retail and sell at wholesale prices. No other business could live a year if it did this.

2. It enables the farmer to sell his product at a better or a more stable price. The average farmer sells his products on the local market for what he can get. He has neither reliable information nor necessary confidence in other markets. Through such an organization as the market department of the Glenn County farm bureau he may learn true market conditions and can command profitable prices.

3. It makes better farms and better farmers. Better farms and better farmers are possible only as the business of the farm is made more profitable and that can be done only by adopting modern business methods.

But a cooperative organization cannot succeed unless it has a loyal membership. In an ordinary stock company the cooperation is with money only. In a cooperative organization like ours there must be a spirit of loyalty as well as money. Loyalty is more necessary than capital. Twenty members who will get in and stick to a cooperative organization are better than 200 who get in and kick.

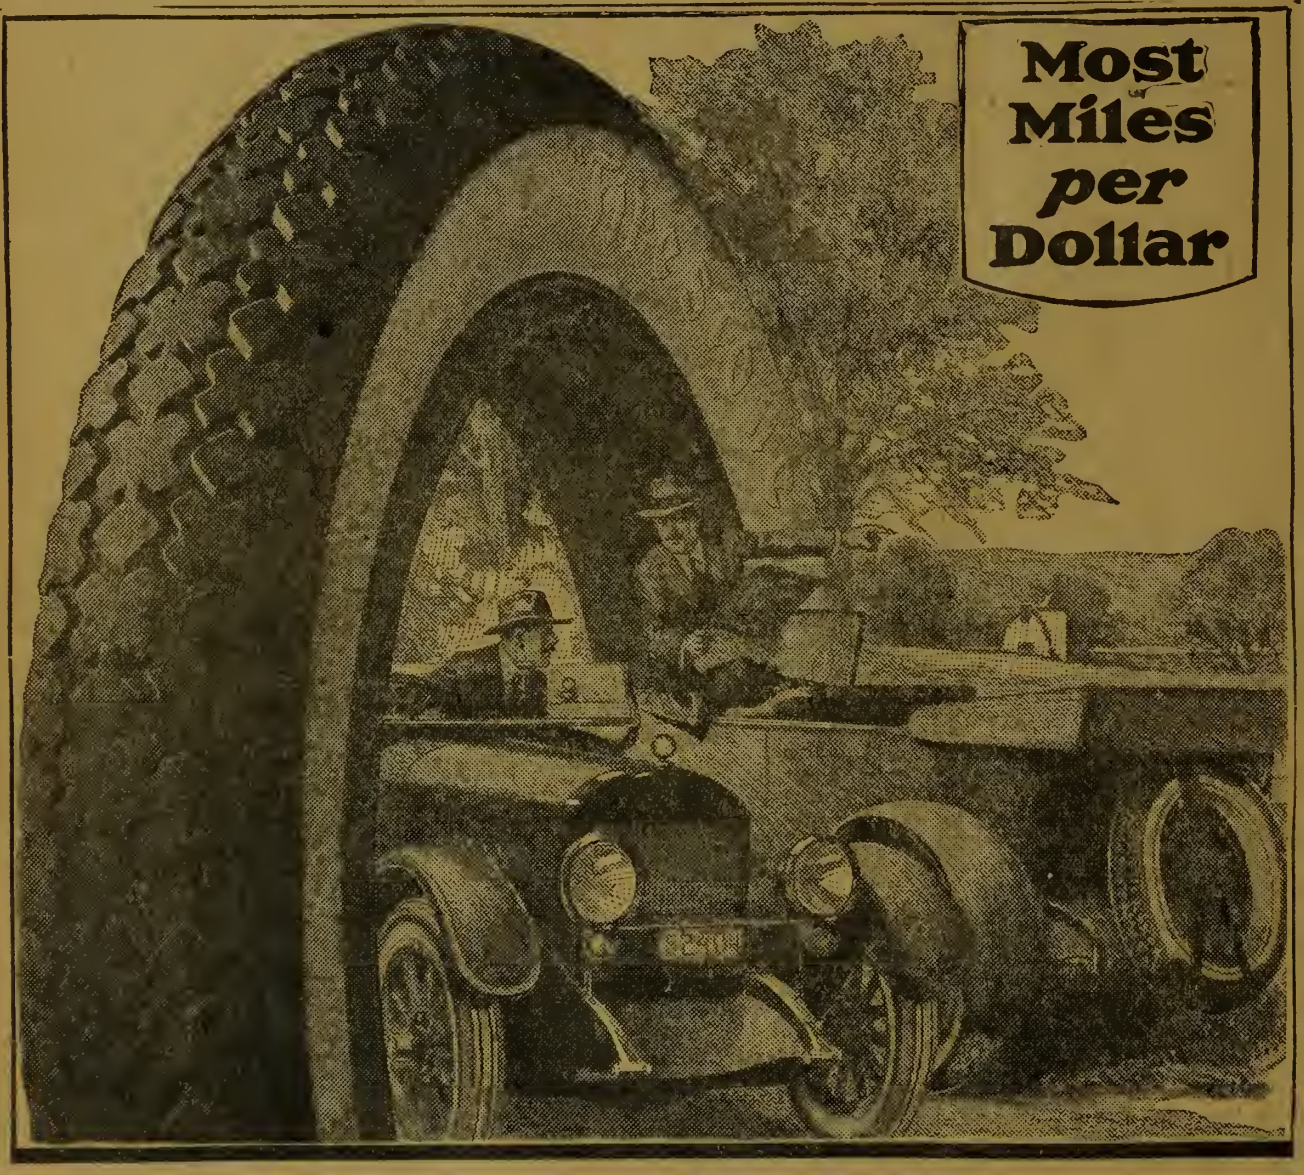
As we said before, cooperation is an achievement, not a gift. You have to get it yourself and the way to get it is to work for it. You have to work to get it and then you have to work to keep it. Cooperation is self discovery. It is finding out who you are and what you can do. The word "cooperation" means the act of working jointly together towards a common end. Cooperation is not a new idea. It has been successfully applied to every form of business and life. Our school system and our government itself are in reality large cooperative enterprises.

Again, the only way to strengthen a muscle is to use it. The same thing is true of cooperation. There is no such a thing as completing your edution—it is only comparative. In one sense the purpose of cooperation is to teach us how little we can do individually and how much through cooperation.

A MODIFIED "POTATO DIP"

The following formula for the treatment of potatoes before planting has been received from County Horticultural Commissioner O. E. Bremner of Sonoma, and as this dip was used last year with success it is desirable that those interested be given the information.

"The dip is practically the same as that used for bluestoning wheat but is not used in quite the same proportions. Dissolve 1 pound of bluestone in 10 gallons water. Soak the potatoes in this for from 5 to 10 minutes. Remove, drain, and immediately dip in a solution of slaked lime at the rate of 2 pounds to 10 gallons water. The potatoes should then be dried, cut, dusted with dry sulphur and they are ready to plant. The advantage of this dip is that it prevents decay of the seed so that if the potatoes are planted in damp ground or should it rain following planting, the seed will not rot but produce a stand. This dip also prevents development of any of the fungus diseases such as rhizoctonia, scab, etc It is certainly worthy of trial."



Part of the "Good Roads" Program

WHEREVER men and cars meet, "good roads" is pretty sure to be discussed.

You want good roads chiefly because they improve farm conditions, facilitate the use of car and truck, and because they will increase the life of car and tires.

The Firestone cord is part of the program because it gives you most miles per dollar. It is the tire that led the industry with the new standard oversize last year. It has made good as "the best buy" in tires, because of its unequaled performance records.

The new standard oversize means more rubber and cord, more air space, better riding, better traction, and much more mileage.

Firestone cord tires are made by workers financially interested in the business as holders of its common stock. They form a practical industrial community; dedicated to low cost transportation—the most for the money in tires.

Get your share of these savings by having your dealer put Firestones on all four wheels.

IF YOU CAN'T BE A PINE

If you can't be the pine on the top of the hill,
Be a scrub in the valley—but be
The best little scrub by the side of the rill;
Be a bush if you can't be a tree.

If you can't be a bush be a bit of the grass,
And some highway happier make.
If you can't be a "muskie," then just be a bass,
But the liveliest bass in the lake.

We can't all be captains, some have to be crew,
There's something for all of us here;
There's work to be done, and we've all got to do
Our part in a way that's sincere.
If you can't be a highway, then just be a trail.

If you can't be the sun, be a star;
It isn't by size that you win or you fall;
Be the best of whatever you are.
—Maryland Training School.

SIR STUPE ID AND THE ROSEBUD CHINA

By Clara Peterson

IN a ramshackle castle at the end of a long avenue in the city of Idron lived the young giant Sir Stan Id—Stupe Id the people had nicknamed him. He was seven feet tall and had been stalwart and brown and handsome, but now he was as fat and awkward as one so young could possibly be.

The government of the city had been given to the Id family when they had known enough to rule wisely and well, but Stupe had so long been careless and idle that now his people were listless and unhappy. Even the vineyards and the orchards did not seem to care about giving their usual purple grapes and ruddy apples.

Stupe was the very laziest person imaginable. The people did not know whether this was because he was so fat or whether he was so fat because he was lazy. At any rate, they all were very careful to go inside their houses when he passed, so they would not have to doff their caps or bonnets and bow.

Now it was Stupe's custom to crawl out of bed at about ten o'clock each morning, yawn while he washed, yawn while he dressed, and yawn while he stamped down stairs. He did not really awaken until he got into the dark beamed dining room and saw his breakfast on the table.

There was only one servant in the castle—old Hilga—who cooked such immense kettles of potatoes each day, who boiled such stacks and stacks of heavy fruit pudding, who prepared so many quarts of mustard sauce that she was worn out from bending over table and stove.

The Id family had always been hearty eaters. Even Stan's mother, the comely Lady Gretchen, had thought nothing of eating a whole stuffed chicken at a meal, and his father had often disposed of a goose, but Stan was three times as greedy as they had been and, moreover, he cared nothing for cereals and soups and the smooth milk puddings Hilga had prepared in the olden days. He had grown so big and coarse that for breakfast he must have a stack of buckwheat cakes three feet high (which did not improve his complexion at all), for lunch he ate dozens of sausages, and for dinner poor Hilga often had to use a whole cheese in concocting a Welsh rarebit.

After each meal Stupe went straight to sleep and usually did not awaken until the next was on the table. He was always too filled up and drowsy to know or care what was going on in the city, and he never realized that the people were beginning to mutter against him. In fact, Stupe was so contented when he had his stomach full and was lying in the canvas hammock on the grass-grown upper terrace that he did not even know that the castle was going to rack and ruin. All the gardeners and housemaids had deserted and there was no one but Hilga to dust the whole inside of the place, but this did not matter, as Stupe never saw any room but his own and the dining hall.

However, one day Hilga fell ill. When Stupe got down for breakfast he found her sitting on the old rocker in the kitchen, a wet cloth around her head.

"O Sir Stan," she groaned, "I am afraid I cannot get your breakfast. I'm so sick——."

Now Stupe wanted nothing in the world so much as a great pile of flapjacks and a platter of pork steak and gravy, but he was kind hearted, so he said to Hilga:

"You go home to your daughter for a week and I'll get another cook. I'll go down to the city and look now, as I must have breakfast right away."

So Stupe put on his shabby cap and went out of the castle into the morning air. It was the first time in years that he had been out before breakfast and he was so hungry that he felt very wide awake. He started down the winding walk which once had had beautiful flowering shrubs on either side, but he had gone only around to the front of the castle when he stopped. There was no path; it was entirely covered by weeds, and thistles bent their lavender heads high above the spindly bushes.

Stupe felt a little ashamed, but he was anxious for his cakes, so he plowed through the grass and down into the city. The streets were dusty and dirty and most of the houses needed paint. The people he met stared, then looked away and did not even bow. Usually Stupe would not have noticed, but now he frowned as he hurried on. He went first to the Id Restaurant, which his father had founded long before. Inside the door he called:

"Send your best cook to the castle at once."

But there was only an old man in the place, who peered in surprise and said:

"Your Highness, there has not been a cook here for months. There are no travelers to feed; the city is dead and going back to dust."

Stupe looked at the empty tables and strode out. From place to place he went. The employment office was closed. The eating houses were empty. There was only one place in town that seemed to be open for business. This was a little white store where a rosy cheeked girl stood in the window and prepared roast beef sandwiches. On the spotless shelves over her head were rows and rows of shining dishes, thin and white with sprays of painted rosebuds straying over them.

The girl stopped spreading butter as Stupe came in. He tried to squeeze between the counters to talk, but he was so fat that he could not manage it. The young woman watched him a moment and waited, then she turned and began cutting thin slices of beef from a juicy roast. Stupe stood looking at her, puffing from running up the steps. At last he pulled a torn handkerchief from his pocket, wiped off his chins and stammered:

"Could—could I hire you to come up to the castle and cook for me? I haven't had any breakfast—the cook is sick and I'm starved. You won't need to stay more than a week."

The girl came out from behind the counter, and Stupe, whose eyes were open wider than for many months, saw that she was about his own age, tall and slim and beautiful. She stood looking at the overgrown fellow, then she said:

"Your Highness, it happens that I am the only cook left in the city, for the place is so very dead that all who could have left. You do not look starved, but I am leaving here this afternoon and if you desire I will be your cook for a week. However, you must let me serve the meals on my own rosebud chinaware. (She pointed to the shelves.) I have never worked with any other dishes and do not desire to do so."

Stupe opened his mouth to say that she might serve the meals on stones if she cared to, just so she began to turn out the buckwheat cakes, but there was something so proud and dainty about the girl that he felt quite out of place and, bowing awkwardly, stumbled through the door, muttering:

"Expect you soon as possible, then."

The next morning Stupe was up early, for his stomach was very empty from the picked-up lunches of the day before. As soon as he opened his eyes he remembered that it was the new cook's first meal. Dorance was her name, he had learned, and long ago her father and his own had been great friends. Stupe had left a note

SHE has a good time at *her own* party—does the hostess who serves Ghirardelli's Ground Chocolate. Whether it's an "afternoon at home"—an informal evening—or some guests who "drop in" unexpectedly—Ghirardelli's offers the happiest solution to the refreshment problem. So delicious, so economical, so easily made!

Never sold in bulk—but in cans only.
In ½ lb., 1 lb., and 3 lb. sealed cans—
at the store where you do your trading.

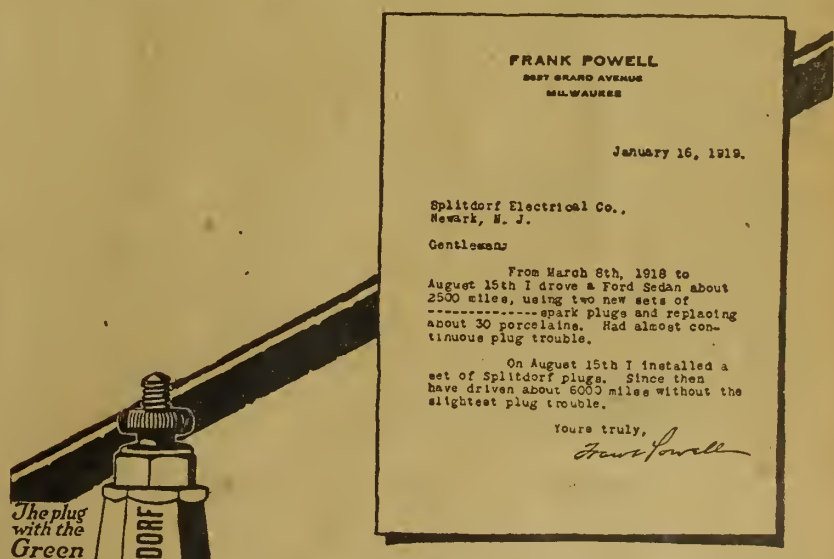
One set of Splitdorfs replaces 30 porcelain plugs



FRANK POWELL
BEST GRAND AVENUE
MILWAUKEE
January 16, 1919.
Splitdorf Electrical Co.,
Newark, N. J.
Gentlemen:
From March 8th, 1918 to August 15th I drove a Ford Sedan about 2500 miles, using two new sets of ----------spark plugs and replacing about 30 porcelains. Had almost continuous plug trouble.
On August 15th I installed a set of Splitdorf plugs. Since then have driven about 6000 miles without the slightest plug trouble.
Yours truly,
Frank Powell

THERE is a type of Splitdorf Green Jacket Spark Plug best suited for every engine of car, truck, or tractor. Each one is absolutely guaranteed against breakage. Send for booklet which tells you the correct plug for *your* engine.

Good tea costs about ⅓ cent a cup. Poor tea costs more—it is weak in tea-flavor; doesn't go so far.

So what's the use of paying the same price for poor tea and good tea?

Don't think so much of the cost per pound. Think of good tea—that comes first.

Schilling Tea costs less per cup.

There are four flavors of Schilling Tea—Japan, Ceylon-India, Oolong, English Breakfast. All one quality. In parchmyn-lined moisture-proof packages. At grocers everywhere

A Schilling & Co San Francisco

in the kitchen, ordering five dozen batter cakes and a platter of chops. In spite of the way his mouth watered for this and in spite of his longing to eat and get out into the sun for a nap, Stupe could not help but remember Dorance's bright eyes. Blushing so that even his third chin grew red, he sewed a couple of buttons on his coat and tried to smooth down his tousled hair. Then he lumbered toward the stairs.

Every window in the dining room was wide open. There was a white cloth on the table and a place set for one with, beside it, a spray of apple blossoms in a silver vase. Stupe walked over to the table and looked down. Instead of his own great blue plate with the crack down the middle—one of the Id family set—he saw a dainty, pink-sprigged plate and beside it an eggshell cup which the sun was trying its best to shine through. Stupe began to feel uneasy, but the door opened and in came Dorance.

"Breakfast is ready, Your Highness."

She poured fragrant coffee into the cup, she brought from the kitchen six slices of hot toast and two soft boiled eggs with a large pat of butter. Stupe stared, but he was so very hungry that when the girl went back into the kitch- he sat down and devoured everything in two minutes.

Dorance re-entered with a little plate of corn meal johnny cake cut into squares. She looked at the empty dishes and asked in surprise:

"Have you finished so soon? I suppose you will not care for this, but I thought you might be extra hungry after yesterday. Please taste it."

Stupe opened his mouth. Could it be possible that she thought she had given him a breakfast? Then he smiled rather sheepishly.

"I'll try a bit," he murmured. Dorance musn't think him a pig.

After Stupe had finished the cake he was as hungry as he had ever been in his life. Dorance was bustling around in the kitchen and somehow he felt ashamed to face her, so he stepped through the long dining room window onto the balcony and swung himself over the railing to the grass below. This was the first exercise he had taken for years and his arms began to ache at once.

Stupe scuffled through the weeds to the hammock and lay down. Then he closed his eyes—but there was a lark singing in the oak branches above him and Stupe turned on his side and looked around. As far as he could see, tall grass covered the terraces and the weather beaten wood of the balcony over which he had just swung looked as though it was falling to pieces. The giant sat up and groaned. Leaning against the castle were a rusty lawn mowing machine and a scythe. One last time Stupe tried to close his eyes, but he did not feel a bit stuffed and drowsy, so he scrambled out of the hammock, and searching in a shed for the oil can, was soon hard at work.

(Continued Next Week.)

HOUSEHOLD QUERIES

Crystallized Fruit

Will you please tell me how to make crystallized or candied fruits? I want to use the different varieties as they come along.—Subscriber, Modesto.

The following directions are given by W. V. Cruess of the state university.

Puncturing, peeling and cutting.—Small crab apples, apricots, plums, cherries, and ripe but firm figs are used whole after puncturing in numerous places with a wooden toothpick. Peaches and pears are peeled and cut in half. The peels of citrus fruits are used without the pulp. Peeled and cut fruits do not require puncturing.

Cooking until tender.—After preparing as above, the fruit is cooked gently. This requires from three to five minutes for most fruits. Hard fruits require longer. Citrus peels may require 30 minutes or longer. Too much cooking will spoil the shape and texture. Too little will result in slow penetration of the sugar, dark color and toughness.

Placing in syrup.—Make a syrup of 25 degrees Balling about one part sugar to three of water. A little more sugar for very sweet fruits. Heat the syrup to boiling and pour over the cooked fruit placed in an earthenware pot while still hot.

A Balling saccharometer is convenient when working on a large scale, but is not necessary for small quantities. Half the sugar in the first syrup may be replaced with Karo or other liquid glucose. This prevents the hardening of the finished fruit by crystallization and makes it more translucent.

Increase of sugar.—Keep submerged in syrup. Remove the syrup every 24 hours, increase five degrees Balling by the addition of about one quarter the amount of sugar used originally, boil, and pour back on the fruit. When the syrup reads 68 degrees Balling (as thick as honey) it is dense enough.

Drying.—Leave in the last thick syrup until it has penetrated the fruit (three to four days) and then place on a wire screen to drain a few days until the outside of the fruit ceases to be sticky. The fruit will drain more quickly if placed in the sun or other warm place.

Packing.—The finished fruit may be packed in candy or cardboard boxes lined with paraffin paper or in open jars. In air-tight containers they may mold; some ventilation is necessary.

Beef Tallow for Shortening

Can you tell me if there is any way to use beef tallow for biscuits, bread, etc.? I can fry with it nicely. Recently killed a beef and successfully canned good supply of roast beef, but cannot seem to use the fine tallow I have. Would a butter merger help?—Subscriber, Somerton, Arizona.

The butter blended with beef tallow would of course make fine shortening, but would turn rancid in a short time. A similar query in regard to use of mutton tallow was answered by Mrs. Kendall of Lakewood in the Household Department of the Cultivator of March 20. Mrs. Kendall wrote:

"We use one pound tallow rendered separately to one pound pure leaf lard, not bacon grease. Pour together while hot in stone jar or glass fruit jar. Add pinch salt while hot, seal and place in cool place. This makes excellent shortening and will last indefinitely."

Flannel Cakes

Will some one give me through the Cultivator, recipe for hot cakes or pancakes such as are served in hotels.—Subscriber, Lodi.

One and one-half cups corn meal, 1½ cups flour, 1 teaspoon salt, 2 tablespoons sugar, 4 tablespoons butter, ½ yeast cake, dissolved in ¼ cup lukewarm water, 3 cups scalded milk. Scald meal with milk; add butter and when lukewarm, remaining ingredients; let mixture rise over night. In the morning cook as griddle cakes.

HINTS FOR HOME BRIGHTENING

By Subscriber, Santa Paula

First of all, I like your new expression so much better than the old time "house cleaning."

"In the spring the woman's fancy quickly turns to thoughts of house brightening, to use a parody on the well known verse.

My idea of home furnishings is that they should be comfortable. harmonious and simple. Deliver me from a house that is so fussy you cannot take any peasure in living in it. Houses were made for people, not people for houses.

"This spring we took up the matting from our bedroom floor, treated the floor to a good coat of paint. First, we thoroughly mopped the bare floor, then when it was dry filled in the cracks with wood filler. As this in turn dried we added three coats of good floor paint of a dark grey green, and lastly a coat of varnish. Of course it is inconvenient not to have the use of the room for three weeks, but the paint looks so much better if given plenty of time to dry.

The woodwork of this room had been enameled, but had become worn in spots, so was given a coat of paint and a second coat of old ivory enamel.

Cream colored curtains at the window and a pretty wall paper colored old ivory with lavender flowers made a new room of it.

The Japanese toweling, white with either blue or green figures on it, makes very pretty side drapes for windows, also nice covers for dresser or small tables. For bed spreads the

The Cultivator Patterns

BE SURE TO SEND SIZE

2488 Dress for Misses and Small Women. Cut in 3 sizes: 16, 18 and 20 years. Size 18 requires 5 yards of 36-inch material. The skirt measures about 1⅞ yards at the foot. Price, 10 cents.

3172. Girl's Dress. Cut in 4 sizes: 8, 10, 12 and 14 years. A 12 year size will require 4⅛ yards of 36 inch material. Price, 10 cents.

3161. A Handy Apron. Cut in 4 sizes: Small, 32-34; Medium, 36-38; Large, 40-42; and Extra Large, 44-46 inches bust measure. For a Medium size 4¼ yards of 36 inch material will be required. Price, 10 cents.

3171. Child's Play Garment. Cut in 5 sizes: 1, 2, 3, 4 and 5 years. A 4 year size will require 2⅜ yards of 36 inch material. Price, 10 cents.

3175-3174. A Pretty Costume. Waist 3175 cut in 6 sizes: 34, 36, 38, 40, 42, and 44 inches bust measure. Skirt 3174 cut in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. The width of the skirt at lower edge is 1¾ yards. For the entire dress in a Medium size 6¼ yards of 36 inch material will be required. Two separate patterns, 10 cents for each pattern.

3185. Girl's Dress. Cut in 4 sizes: 4, 6, 8 and 10 years. For a 6 year size, 2¾ yards of 42 inch material will be required. Price, 10 cents.

2800. A Comfortable Breakfast Costume. Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Size 38 requires 4⅝ yards of 38 inch material. Width of skirt at lower edge, is about 2 yards. Price, 10 cents.

3165. Child's Night Dress. Cut in 5 sizes: 1, 2, 3, 4 and 5 years. A 4 year size will require 3¼ yards of 27 inch material. Price, 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns. Address

California Cultivator
Los Angeles

toweling joined with heavy lace or crocheting and with a narrow border of lace or crocheting is very pretty and inexpensive.

In the bargain basements one can find very pretty marquisettes in plain white or cream color that make lovely curtains. They wash nicely and are quite inexpensive. At 35 cents a yard have found some very pretty pieces. Also, if you watch the remnant counter you can often pick up desirable patterns for curtains.

Crinkled dimity, which can be purchased by the yard at the larger department stores, makes nice bedspreads and is much less expensive than the ready made spreads. It is light, easy to wash and does not soil easily.

One thing which brightens up a house is to get rid of some of the old knick knacks that take up room and collect dust and have outlived their usefulness. Any of the worthy charitable institutions will be glad to get contributions of household articles and used clothing. As one of them says, "We can use anything but rusty tin cans and broken glass." These old articles are sold to poor people, after other poor people, usually those unable to do heavy work, such as cripples and women with little children, have repaired them. Of course they are sold at a nominal sum and so help lots of people who have too much self respect to beg.

For cleaning the outside of your windows, get one of the window cleaners that all good hardware stores carry now. They are simply a piece of rubber attached to a long handle, but are fine for cleaning the outside of windows.

A good home made dust mop can be made of old stockings. Cut them in lengthwise strips and when you have enough to make a good mop half way in the middle sew a strip of heavy cloth. Then place in a mop handle. Dip the mop when needed in O Cedar or other floor oil and use on painted or hardwood floors, and you have a good dust mop. When it gets dirty, clean by immersing it in hot water to which has been added a half cup of Gold Dust and a little household ammonia. Then after the mop has dried oil again and use as before.

These are a few hints that have proved of use to me and hope they will help someone else among the Cultivators. "Brighten the corner where you are."

PINK BEANS ARE GOOD EATING

By E. J. T., Stockton.

I am going to give you a recipe for cooking pink beans a new way—not new to me but never before published—and I think it will be a big (?) help to the bean industry, for after tasting these delicious pinks everyone will buy them by the sack. This is no joke. You will want them three times a day.

Save 1-2 on Fuel

CHEAPEST HEAT YOU CAN BUY

The Sievert Oil Burner burns either distillate or kerosene oil in cook stoves, heaters, furnaces, pasteurizers, boilers, prune dippers, dairy sterilizers, etc. Absolutely safe, odorless, very convenient and low priced. MAKES HEAT AT HALF WHAT WOOD AND COAL COSTS. Install it yourself. Write for circular and prices on different sizes. Address Sievert Oil Burner Co., 710 North Main St., Los Angeles.

Dyed Her Faded Skirt, Also a Coat

"Diamond Dyes" Make Shabby Apparel Just Like New—So Easy!

Don't worry about perfect results. Use "Diamond Dyes," guaranteed to give a new, rich, fadeless color to any fabric, whether wool, silk, linen, cotton or mixed goods,—dresses, blouses, stockings, skirts, children's coats, draperies,—everything!

A Direction Book is in package.

To match any material, have dealer show you *"Diamond Dye"* Color Card.

1 quart beans (dry), cook till half done or more; 1 large onion, 1 red pepper, 1 slice bacon; ½ cup salad oil or olive oil; pinch of black pepper; salt; ½ can tomatoes; 1 large pinch Spanish herbs (use a litle more of the leafy herb than of the seed. Tie these two herbs together in cloth and add everything named except salt when beans are beginning to soften. Salt when about done.

These herbs are unknown to many people, and can be bought only of large groceries, Italian groceries particularly, and five cents worth of each lasts a long time. I will give the address of one firm that carries it, and this can no doubt be obtained of the publishers of this paper in case it is against the rules to publish it.

And here is another good one:

Bean Pie

Cook pink beans till very done. Mash through a colander. Thin with milk, sweeten, flavor with vanilla and tiny bit of salt. Use one whole egg or yolks of two. Beat whites to a stiff froth and sweeten. Bake pie just as you do a custard in one crust. Put whites on top and brown. Tastes much like chocolate.

SPRING VEGETABLE DISHES

This is the time of the year when a new way of cooking vegetables or making a vegetable salad is most appreciated. An unusual vegetable combination and a super extra good cabbage salad are here given by a friend of the Cultivator:

Cabbage Salad

Three cups finely chopped cabbage. Put in a dish in layers with a little salt and pepper sprinkled between.

Dressing: 2 teaspoons butter (fairly heaping), 2 teaspoons sugar, 2 teaspoons flour, 1 teaspoon mustard, ¾ cup vinegar, 1 well beaten egg. Stir all together and let come slowly to a boil.

Pour over and mix well with the cabbage. Cover until it is cooled.

Vegetable Combination

Two onions, 4 tomatoes, 2 Chile peppers, taking out most of the seeds, 2 summer squash, small, but not the tiny ones.

Peel and chop all together. No water if you have a double boiler; if not a little water may be necessary. Be careful it does not burn. Cook slowly for half to three-quarters of an hour, when it should be a little softer than mashed potatoes. Season with salt, pepper and a little butter. Serve hot.

THREE PARTICULARLY GOOD ONES

Spanish Cake

Half cup shortening, 1 cup sugar, 1 egg, ½ cup milk, 1¾ cups flour, 4 teaspoons baking powder, 1 teaspoon cinnamon.

Cream shortening, add sugar, beaten egg yolk and mix well; add alternately a little at a time, the milk and flour which has been sifted with baking powder and cinnamon; fold in white of egg beaten stiff. Bake in loaf pan 35 to 45 minutes or in individual cake tins 20 to 25 minutes.

Sponge Cake

Three eggs, 1 cup sugar, 4 tablespoons cold water, 1 teaspoon flavoring extract, 1 cup flour, 1½ teaspoons baking powder, ¼ teaspoon salt.

Beat yolks of eggs with sugar and stir in water and flavoring; sift dry ingredients together and add to previous mixture, beating well for five minutes; fold in well beaten whites of eggs and bake about 40 minutes in moderate oven.

Thin Rich Cookies

Three eggs, 1 cup sugar, ½ cup butter, pinch of salt, enough flour to roll out.

Roll as thin as possible, brush the surface lightly with well beaten egg, sprinkle with granulated sugar, cinnamon and finely chopped nuts. Cut in squares and bake till brown.

AN INQUIRING YOUTH

"Bobby, you were very naughty to go on the ice when I told you not to."

"Well, m-mother, I didn't go to slide. I j-just went to find out wh-why you told me not to."—Life.

So far it is only a treaty of pieces.

FREE Books of FURNITURE Styles and Fashions

THE FISK RUBBER COMPANY

OF NEW YORK

FISK TIRES

TIRE SUNDRIES

CHICOPEE FALLS, MASS.

PLEASE ADDRESS REPLY "ATTENTION OF

TO CAR OWNERS:

In my former letter I told you something about our Company and its merchandising policy.

I want to tell you now about our product. There are two types of tire as pertaining to construction, Fabric and Cord.

The fabric tire is made of a close woven fabric and the cord tire is made of layers of cords which tend to increase the elasticity of the tire.

The Fisk Cord is the maximum in oversize, has larger buttons size for size and having the standard Fisk Non-Skid design it is superior in its protective qualities. It is an economical tire although its first cost is greater than that of the fabric.

Fisk Cords are made in all sizes from the 30x3½ " Clincher for your small car to the 40x8" for your truck. Consult your dealer and tell him that you want a Fisk for your next tire.

Incidentally, we have something useful that you may find handy - some art blotters of convenient size which illustrate our various tires. We shall be glad to send you a set with our compliments on request. For your convenience use the coupon below.

Very truly yours,

E. H. Broadwell

EHB:M Vice President & Gen'l. Manager

Please send me, without charge, the set of art blotters illustrating golf, polo, hunting, boating and one of your Time to Re-tire boy.

I own a (give name)_____car.

UNIVERSITY OF ILLINOIS LIBRARY

Settlement of the Public Land of the Imperial Valley

Professor Elwood Mead has brought more lands to the landless and more homes to the homeless than any other, and the end of his efforts in this direction is not yet. Australian land settlement plans worked out many years ago have proved a great blessing nationally and to the individual settlers. Durham settlement details are not all worked out yet but more than a hundred families in a hundred contented homes (which were not two years ago) are beginnings which prove that both the state's loyal citizenry and resources are increased. Now Dr. Mead has another dream—this time for the Imperial Valley. He spoke before the League of the Southwest as follows:

HOW to help landless men own farms is a vital social problem. It is the most important which this league has to consider. The largest area of irrigable public land in this country is in the Southwest. The Colorado River has a large unused water supply. We have to consider how this land and water may best be put to human use, and this is an appropriate time. The lower house of congress has passed a bill directing the secretary of the interior to prepare a plan for the complete irrigation of the Imperial Valley. If this bill becomes a law these plans will include the irrigation of 300,000 acres of public land now arid. They will show where the water is to come from, what the reservoirs will cost, and what each acre of land will have to pay. That is the engineering and money part of the problem.

The method of dealing with the water supply is good. The whole problem is to be thought out to a conclusion. Preparations of the engineering plans by the reclamation service insures their success. The achievements of this service are a source of pride to the nation. Nothing in our history is finer than the honesty and capacity of this corp of engineers. The dams and canals it has built stand the tests of service. We can be confident that if their plans are carried out, the water problem will be solved.

The human problem remains to be dealt with. How is this land to be settled? It will provide farm homes for 10,000 families. For every family that lives in the country there will be one or more families in the town these farms support. How and where are these towns to be located? Who is to plan them? The value of this development will in the end be measured almost exactly by the amount of time and thought we give to plans for settlement befor settlement begins.

Neat, Livable, Comfortable, Homey

A farm cottage at Delhi built by the commission. Where the farmer prefers he builds his own home, but if he desires the state will attend to the construction.

The Starting of a Great Vineyard Section

Hundreds of thousands of Thompson Seedless cuttings are being planted in nursery rows at Delhi. Another year they will be reset in vineyards.

We have talked a great deal in this country about getting back to the land. But for the poor man to get a farm in this area some way must be provided for him to get generous credit because there will be no income and no payments on land or water until the farm is improved and equipped. The improvement of a 40 acre farm, including payment for the water right, will cost close to $200 an acre. How much of that money ought the settler to have? How and where is he to get the remainder? What interest is he to pay? How much time is he to be given? All these are vital questions. Where this money is to come from should be decided before the land is thrown open to settlement. If a settler can get money at 5 per cent for improvements the yearly interest charge—(Continued on Page 658.)

REO

Time—Time!

Time is the essence of everything to the Country Business Man.

The element of time is of even greater importance to the agriculturist, the stock raiser, the dairy or truck farmer, than it is to the urban business man.

In seed-time, haying or harvest time, the loss of a day may mean the loss of a large part of the season—and much, if not all, the net profit on the year's work.

For weather and growing crops will not wait.

Nor will the markets—either local or national.

When a broken farm implement necessitates taking the team off urgent work for several hours to get the repairs or replacements, it often means loss of many times their value—less acreage in crops—or grain lost through over-ripening.

That's when the pneumatic-tired Reo "Speed-Wagon" proves its worth and quickly pays for itself.

It leaves to the horses or the tractor the field work while it does all the road running.

This Reo "Speed-Wagon" markets at twenty miles an hour instead of four.

Eighty per cent of the time now wasted between farm and town can be made available for increased profits.

And—the Reo will do another day's work after the horses are in the barn.

Successful farmers no longer consider getting along without a motor truck—it makes successful farmers.

There is a Reo Dealer in your Vicinity.

Uses of the Newer Grasses

By Ernest Braunton

ALL are familiar with the uses and abuses of the blue grass of lawns, Bermuda grass and Johnson grass, but there are many other good grasses somewhat common and new ones are coming to us for trial from all parts of the world.

Among the hardy grasses somewhat used for many years are the Australian and Italian rye grasses, Lolium perenne and L. Italicum, respectively. Both these make good lawns, especially in shade where Kentucky blue or June grass slowly fades away. They are also excellent pasture grasses, particularly good on damp soils. And this is largely true of meadow fescue, Festuca elatior, and its smaller variety, F. pratensis.

Other good pasture grasses are smilo, Oryzopsis milacea; water grass, Paspalum dilatatum; and Toowoomba Canary, Phalaris bulbosa. The latter, an introduction from Australia, is as yet little known here but so far as tried it promises well as it is resistant to extreme drouth, grows well on sandy desert soil and, like the two others, has a fine anchorage in the soil so stock cannot pull it up when grazing. The paspalum also has a running root system that makes for rapid sprcad. The brome grass, Bromus inermis, is also a favorite, hardy, able to stand much moisture and even submergence by flood waters for several weeks without apparent injury. In Texas another brome, B. unioloides, seems to have surpassed all other annual grasses in spreading over thousands of acres, much improving the natural pastures.

The Newer Grasses

Para grass from Mexico, Panicum-muticum, is rapidly becoming a favorite here as elsewhere in similar climes. In appearance it is much like Johnson grass but with none of the latter's bad qualities. It roots on the surface only and does not make seed in this climate so it is easily gotten rid of and cannot spread by seeding as does the Johnson grass. It forms dense mats that smother out all other grasses and grows throughout the winter when others of its class remain dormant. In California it has grown to seven or more feet high but is usually cut for hay when three to four feet high and if tops are killed down by frosts it has an equal feeding value with the green crop.

It cannot, however, grow where frosts are severe, yet is not killed, merely losing its top. It may be as well to state that Para, Rhodes, Napier and half hardy grasses should not be close cut late, as is so often done down to October. August should be the last month for mowing. Then the tops will grow sufficiently to protect the crowns from cold. Para grass will grow in shade and under shrubs, near to water, will propagate from either stems or root division and has many other merits. If allowed to grow it might fill water ditches but it is easy of control. It may be cut three to five times each season, makes excellent pasturage, and may be planted at any time of the year.

Rhodes grass, Chloris gayana, comes to us from South Africa and will grow under conditions similar to Para grass but is somewhat hardier, standing about ten degrees more of frost. It has become more popular in Florida, Texas and Arizona than in California, yet it has given excellent satisfaction here wherever tried. It will also run out Bermuda grass and weeds of all kinds, and such infested lands, when finally plowed, are free from plant pests.

Teff grass, an eragrostis, is a late comer and not well known in California. From personal investigation the writer has found it pulls up very easily so that stock would soon destroy it as a pasture grass. For a quick growing catch crop for hay it serves a purpose. It is quite tolerant of alkali and catches well from seeds on a variety of soils and under harsh conditions.

Guinea grass, Panicum Jumentorum, is one of the most promising of the newer grasses and has a wide range of possibilities. In South America stockmen have two forms, one lowland, the other highland. The latter is used for general stock range or pasturage and is an extremely resourceful grass. The lowland form is used for dairy feed. It is quite hardy and propagates easily by joints of the stem or through division of the roots, but does not seed well. It is, however, quick growing and of heavy food value.

So much has been written of late about Sudan grass that we will skim lightly over the subject for either much or little should be written of it and it is worthy of a separate article. It first came to us in 1909 from Khartoum, Africa, a hot dry climate that is harsher than any in California except that of the acknowledged desert regions. Sudan bears a striking resemblance to Johnson grass in gross appearance but there the similarity ends, for it has all of the good points of Johnson grass with none of the bad. Botanically it must be classed as a variety of Andropogon Sorghum and not of the Johnson grass, which is A. halepensis. In California its success and popularity is assured. It is not exacting as to soil requirements, being even quite tolerant of alkali. Unlike Johnson grass it is an annual. It endures extreme heat and also thrives with excessive moisture. It grows rankly over a long season.

Now we come to the greatest of all, in size at least, the elephant or Napier grass from tropical Africa, introduced to cultivation by one Colonel Napier. This grass has proven a great success in California and still is growing in popularity. It will endure cold of 18 degrees, Fahrenheit, but probably not a lower temperature. From all sections of California, where warm enough, come favorable or phenomenal reports. Two months after sowing cuttings in furrows it may be grazed or in three months it may be cut for hay or silage and if supplied with water in hot sections may be cut once a month thereafter. If allowed to grow it soon gets ten feet high and may be cut or grazed to the ground and yet responds more strongly than ever. All kinds of stock eat it with avidity and one goat raiser says his animals prefer it to alfalfa, seem to keep in better condition on it and the amount of croppage is several times greater. He says no more alfalfa for him. And it thrives on soils too light and dry for alfalfa.

H. L. Musser of Los Angeles has a private plat near his residence where all the grasses mentioned, and many others, have been and are being tested from year to year. This "grass patch" has been visited by the writer and results herein recorded.

Rations for Baby Chicks

By Jean A. Koethen

THE feeding of baby chicks is a topic that seemed to me to have been gone into quite fully on this page the last three months, but several inquiries that have come in indicate that there is still something to be said. One asks for general information as to raising chicks and another wishes to know "just about how much and in what proportion" animal feed should be given.

To begin at the beginning, chicks are not fed for at least 48 hours after they are hatched. Expert incubator operators leave the chicks in the nursery two full days after the hatch comes off, not two full days after the last chick hatches, but two days after the majority of the chicks are out of the shell. Then the chicks are put in the brooder and kept there nearly another whole day before they are fed. Suppose, for instance, the 21st day of incubation is Saturday. In a normal hatch the chicks will begin to pip the shell Thursday night or Friday morning, and by Saturday morning the hatch is practically out, though there may be a few late chicks still in the shell. The chicks are left in the incubator nursery till Monday morning and then transferred with great care to the brooder. If they are to be shipped as day-old chicks they are now placed in pasteboard shipping boxes and sent to their destination so that many will hardly get their first meal before Tuesday morning, three whole days after the hatch is off. When the chicks are transferred at once to the brooder, however, they are kept quiet and warm until toward evening and then given their first meal just before bedtime.

The First Feed

There are so many different nursery feeds and so many ways of using them that I cannot do better than give a few sample methods. Many persons place a fountain of sour milk or buttermilk before the chicks as soon as they are in the brooder in order that they may become accustomed to it from the very start. The lactic acid tones up the digestive organs and is considered something of a preventive of white diarrhoea and coccidiosis. The chicks will not drink much the first day but they get a little and are ready for their dry rolled oats or steel cut oats or hard boiled egg at supper time.

A variety chick ration which had excellent results at Cornell was as follows:

First to third day: 8 pounds bread crumbs, 2 pounds hard boiled eggs moistened with sweet skim milk. This amount was fed five times a day to 110 chicks, and a grain mixture consisting of 3 pounds wheat, 2 pounds corn and 1 pound hulled oats, with a little bran, was kept before the chicks in a tray.

Third to seventh day: Gradually substituted for the bread and egg was a johnnycake made of 4 pounds corn meal, 1 dozen infertile eggs, 2 pounds sour milk, 5 teaspoons baking soda. This was fed twice daily, the scratch grain was thrown in the litter two or three times daily, and wheat bran was kept before the chicks in a separate trough or hopper.

The egg and bread nursery feed is a standard one, but because it is a good deal of trouble and rather expensive, experiment stations in more recent years have been working toward a simpler ration.

At the university farm at Davis water is put before the chicks as soon as they are in the brooder, and they spend their first day learning to drink and picking at the sand on the floor. The first two days they are given a grain mixture composed of equal parts fine cracked wheat, fine cracked corn and steel cut oats. This is left before them in a wooden chick hopper so that they can pick away at the grains and learn how to eat. When they have learned to eat the grain is scattered on the sand for a day to teach them to scratch. Then a light litter of alfalfa or clover is put over the sand and from this time on all grain is fed in the litter. No mash is given till the sixth day when the following mixture is fed at ten o'clock, but is left before the chicks for only a short time: 2 parts bran, 2 parts shorts, 1 part corn or barley meal, 2 parts beef

(Continued on Page 676.)

Agricultural News Notes of the Pacific Coast

Northern California

Sutter County is making war on squirrels.

Vacaville growers expect an early cherry season.

April 24 is Picnic Day at the university farm at Davis, Yolo County.

Short courses in agriculture at the university farm at Davis will begin June 1.

May first is opening date for a large new cannery at Gridley, Butte County.

Members of the Yolo County farm bureau are planning to form a county wool pool.

Buyers of wine grapes are offering to contract for Yolo County's next season's crop at $50.

Local centers of the Solano County farm bureau have established fire fighting stations.

One concern will ship 2,000 carloads of vegetables out of Sacramento during the coming season.

It is anticipated that the fruit season will open at many of the canneries two weeks earlier than last year.

H. A. Weinland, formerly farm adviser of San Diego County, has taken up the same work in Sonoma County.

The land owners of the Glenn Colusa irrigation district have declined to become a member of the water users' association.

Fifty-three automobiles were required to carry the farm bureau delegates on their trip through the Sacramento Valley.

The seven largest asparagus canneries in the world are located in Sacramento County. The 1920 pack will exceed 750,000 boxes.

A state inspector of dairies reports the best conditions generally prevailing in the dairies of the Durham Colony of any section of similar size.

Apple growers in the district about Soulsbyville, Tuolumne County, are discussing the erection of a fruit dryer and cider and vinegar plant.

The price of asparagus to delta growers will be around six or eight cents per pound, said to be the highest price in the history of the industry.

Apple growers of Tuolumne County met recently at Soulsbyville to try and decide on three or four of the best commercial varieties of apples for future planting.

Irrigators of Alameda County have been circulating a petition for the formation of a district to secure waters for lands not now irrigated.

Farm bureau meetings will be held in Placer County at Penryn, April 12; Bowman, 14; Allen, 16; Applegate, 19; Weimar, 21; Forest Hill, 22; Mt. Vernon, 24; Roseville, 26; Colfax, 28.

Attorney General Webb in the name of the people of California will protest before the United States reclamation service in Washington against any project for draining Lake Tahoe for commercial uses.

Relative importance of agricultural and power interests in the use of Sacramento River water was the subject of discussion at the first meeting of the Sacramento River Watershed Water Conservation and Flood Control Association held recently in Sacramento.

Central California

A big milk products plant has been constructed at Tulare at a cost of $200,000.

The Raisin Day committee at Fresno expects to entertain 150,000 people April 30.

The annual convention of county road engineers was held at Merced March 26.

Wine grape growers are being offered 15 to 18 cents a pound for dried black grapes.

Bakersfield will finance a movement for the building of a cotton gin at Arvin, Kern County.

Planting of broom corn in the Lindsay district, Tulare County, will begin the middle of the month.

The Tulare County citrus sections are rapidly finishing the pack of Valencias. The output is larger than anticipated.

A hog auction under the auspices of the California Farm Bureau Marketing Association was held at Modesto, April 6.

The members of the California Tobacco Growers Association met at Fresno, March 26, to consider marketing their crop.

A dam is to be constructed on the San Joaquin River which will inundate Millerton, the first county seat of Fresno County.

The Monterey County Tax Payers Association has been organized to secure greater efficiency and economy in county administration.

The close of the fourth month of the farm bureau egg laying contest at Santa Cruz shows total number of hens laying 59 per cent.

The San Jose grange has taken formal action protesting against any movement looking towards bringing Chinese labor into the country.

Modesto irrigators are asking for retirement of water directors who are declining to take action in needed improvements of the irrigation district.

Hog growers of Kings County have decided on November 28 as Pork Day. One feature of the day's observance will be the sale of 25 carloads of hogs.

A dehydrating plant is contemplated for Tulare for which 500 acres of sweet potatoes have already been contracted. It will have a capacity of six tons vegetables daily.

County Dairy Inspector Peairs of Tulare County is endeavoring to secure more complete following of standards established by state dairy bureau. Tulare has some exceptionally fine dairies.

The state railroad commission has authorized the San Joaquin Light and Power Corporation to increase its rates for electricity by an average of 11 per cent. The order became effective April 1.

The Central California Berry Growers Association with headquarters at San Jose are taking a decided stand against deceptive berry packs with "nice large berries" on top and "unnice small berries" underneath.

Supervisors of Kern County have passed resolutions protesting against the passage of the Osborne acqueduct bill which provides for the withdrawal of public lands in certain districts, giving preferential rights to the city of Los Angeles.

Southern California

Experts are directing the fight against codling moth of the walnut.

Hemet, Riverside County, reports "Outlook good for crop of apricots. Never more promising."

Practically every farm adviser of the southland accompanied the farm bureau trip through Sacramento Valley.

Santa Paula, Ventura County, has a new citrus packing house with 16,000 square feet and thoroughly up to date equipment.

Los Angeles County Cow Testing Association now has a membership of about 2,500 cows. Some excellent work has been done.

Ventura County cattlemen recently met at Santa Paula and elected W. H. Hoffman president and Gerald Waterhouse secretary.

So far as can be judged this early most fruit sections will have exceptionally large crop and fruit will be much earlier than last year.

The Hemet Walnut Growers Association recently met and received reports of managers. The annual business aggregated about $15,000.

The largest chick hatchery of the Southwest is promised to Riverside. There will be an incubator capacity of 80,000 chicks every 21 days.

By the provisions of the senate agriculture bill now under consideration Los Angeles County will be given $73,580 for tree planting on watersheds.

Citrus shipments have been seriously interfered with by the yard men's strike. Pickers have been stopped and no more deliveries are being made at the packing house.

Riverside County Cow Testing Association has 38 cows testing 40 pounds or better. The two best cows ran above 80 pounds of fat, both belonging to R. E. Babcock.

Southern California regional conference for home demonstration agents was held in Los Angeles last week. Mrs. Eddy, state leader of home demonstration agents, presided.

The California Fruit Growers Exchange estimates that Southern California will ship between 50,000 and 60,000 carloads of oranges and 15,000 and 20,000 carloads of lemons annually within the next few years.

There will be meetings of stock raisers at Ventura April 7, at San Diego April 3, Brawley April 10, preliminary to the semi-annual convention of the California Cattlemen's Association at Los Angeles April 15 to 17.

The Dominguez Ranch, 25,000 acres near Torrance, Los Angeles County, is being cut up into small tracts and rented and sold. The acreage is being put into beans, tomatoes and other crops suitable for that section.

There is much of contention between Arizona irrigators and California irrigators as to weir construction and diversion of the waters of the Colorado. At present Yuma is denying Imperial Vailey's right to construct a weir.

The Imperial irrigation district will call a bond election for voting on an all American Canal to cost approximately $30,000,000 and construction of the first leg of the canal from Laguna Dam to Hanlon heading to cost $9,000,000

The Coast and General

Sherman County, Oregon, is pushing a farm bureau campaign.

Arizona reports by far the greatest demand for pumping plants in its history.

Arizona is planting greatly increased acreage in cotton — exclusively Pima.

Pacific ports are sending great quantities of modern machinery into China.

The University of Arizona is giving out information as to testing wool fabrics.

Washington County, Oregon, farm bureaus are holding a series of poultry schools.

After a month's repair campaign the Salt River Valley irrigation canals are running bank full.

Farmers in New York and other Eastern states are appealing for more dependable farm help.

Linn County, Oregon, is planning construction of six large buildings on its fair grounds at Albany.

The first cargo of products out of Mexico to Germany since the war was carried in an American vessel.

Ranges near Williams, Arizona, are being greatly improved by melting snows releasing much pasturage.

Arizona is shipping 200,000 bales long staple Pima by the way of Port Los Angeles to English cotton mills.

The largest cow testing association in Oregon is that of Coquille Valley. It contains 75 dairymen with 15,000 cows.

Two thousand acres will be planted to Pima cotton on the Colorado River Indian Reservation near Parker, Arizona.

Oregon dairymen are waging war against milk distributers and asking more fair division of the consumer's dollar.

Farmers at Toledo, Oregon, are uniting and purchasing phosphates in car lots. More than 100 farms are being supplied.

Recently elected officers of the Pima County farm bureau, Arizona, include W. Hodgson, president; C. A. Travers secretary.

Cattlemen of Oregon recently met a Le Grande and discussed methods o beef production at present prices o feed and of livestock.

The Navajo Indians of Arizona have coined a new word for automobile. It is "Sinnapaschugy" an means "a wagon that goes with chug."

Arizona stockmen are finding silag excellent and economical in replacin deficient pasturage and especially i it proving satisfactory with rang calves.

Texas grain growers are askin congress for reimbursement becaus of wheat losses aggregating $5,000 000. They are charging the loss t Hoover.

Share holders in the Salt River Va ley Water Users Association propos to assess themselves $1.14 an acre fo extension of canals and another $2 pe acre for drainage system.

Arizona cotton growers are arrang ing for importing Mexican labor fo its 200,000 acres of long staple cotto to be grown this season. It is est mated the state will need 20,000 add tional laborers.

Housing of Ranch Labor

By J. D. Culbertson

AGRICULTURE is the one basic industry of the world. It is the industry that feeds and clothes mankind. So fundamental is it to the welfare of humanity that its efficiency must be kept at a maximum and its costs as low as possible consistent with that efficiency. The one big cost item to be reckoned with is labor.

Supply Declining

That agriculture has been the basic industry of the United States is well sustained by the fact that up to the year 1912 agricultural products constituted over half of our total exports every year, without exception, since the founding of the nation. Seventy years ago 80 per cent of our exports were agricultural, and still above 50 per cent at the outbreak of the European war. A hundred years ago 83 per cent of all individuals eugaged in gainful occupations in the United States were engaged in agriculture, 83 per cent of the sons and daughters of America were being born on the farm and apprenticed to agricultural life. Today scarcely more than 30 per cent of our working population is engaged in agriculture and probably even a smaller percentage of the children raised on the farm. The proportionately greater task devolving on the farmer of today, as compared with the farmer of a hundred years ago, is most evident, while his potential supply of labor is on the rapid decline.

This startling reduction in the percentage of agricultural workers has been offset largely by improved methods in agriculture, particularly by the introduction of labor saving machinery. It is probable also that 100 years ago a goodly number of those listed as engaged in agricultural pursuits were doing, on a small scale, the work now performed by the great meat and food packing industries that are not regarded as strictly agricultural industries. These offsets, however, have not been sufficient to maintain the relative status quo between agricultural production and agricultural labor supply that has generally prevailed until the last few years. This was not fully appreciated until America called on 3,000,000 of her sons for military service abroad and summoned other hundreds of thousands to engage in war industries, while at the same time the annual half million immigrants from Europe failed to come. Nor was that all. Under the stress of war more and more food was needed from America, and the government urged upon the public the use of every additional acre of land that could be brought under cultivation. Every such acre has called for additional labor.

Man Power Per Acre

According to the census of 1900 each agricultural worker in the United States on an average performed annually all of the labor required on 40.5 acres. In the Dakotas the acreage per man was highest, 135, and lowest in the District of Columbia, where each worker handled but four acres. The present average for the nation is probably about the same as 20 years ago. In Southern California the total annual labor of one man is required to properly care for two to three acres of full bearing lemons, pick the fruit and pack it for shipment. Three to four acres of full bearing oranges require about as much labor as two to three acres of lemons. This means a stupendous labor charge—so great, in fact, that during our pessimistic moments we wonder how long the citrous industry can continue to prosper under the burden. Yet the most successful citrus growers have proceeded on the policy that "what is worth doing at all is worth doing well," and their labor charges have been among the heaviest per acre.

Seasonable Demands

The labor problem associated with modern intensive agriculture of any kind is very like the labor problem associated with manufacturing or mining industries. It involves large numbers of employes and a dependable, efficient labor supply. Unlike manufacturing and mining enterprises, however, agriculture is not able to expand or contract its operations more or less at will. Neither is it possible to so regulate the work that a uniform number of employes can be kept busy regularly the year through. Subject to the seasons, the vagaries of the wind, the rain and temperatures, agriculture knows its labor needs only from day to day.

Following the comparison a little farther, agriculture finds itself at a great disadvantage as compared with most industries in that its work is scattered over wide areas, miles in extent, and of necessity far out beyond the reach of the working population of towns and cities. In lines of agriculture which have a very pronounced harvest season in midsummer, requiring a large number of employes but for a few days, such temporary labor usually can be secured quickly from the cities, and the season of the year permits of temporary and inexpensive housing in tents or other improvised shelters. A relatively moderate wage will attract to such work countless city families and many men who enjoy the change of occupation and regard the experience in the light of a summer outing, as well as an opportunity for all members of the family to earn a bit of extra money.

All the Year in Citrus Orchards

The citrus grower has a different problem. His harvest season is almost continuous the year through and his other labor needs fit into the picking cycle to make possible steady, annual employment for much of his help. This involves the question either of housing steady, dependable help on the premises, or of transporting daily whatever miscellaneous supply may be available from the nearest village or town.

On many of the larger properties a dormitory for men with a boarding house in conjunction has met the need fairly well, particularly while the orchards have been young. But today the lure of the city industries and trades makes it almost impossible to hold on the ranch a sufficient force of men without families. This applies not only to our American labor but as well to foreign. It was only 15 years ago that so called single Japanese were available in abundance and cheaply housed in dormitories. Today the few that apply want apartments for themselves and wives. In 1910 it was an easy task to secure detached Mexican men laborers, young and old, even if one had only the plainest of sleeping quarters. At the present time it is next to impossible to persuade any appreciable number of young and unmarried Mexicans to move out of town for work in the country.

Single—Married

Because he could be housed more cheaply, secured with the least complications and, if unsatisfactory or not needed, discharged with only casual reluctance, the single man has always been preferred as a ranch or farm hand. The necessity for holding down costs has been responsible for this, just as it has been responsible for the employment of the cheapest labor available. Now that the supply of single men, both American and foreign, has proven so altogether inadequate, the farmer and fruit grower is giving more and more attention to the family unit as a source of labor. Experience has shown that at prevailing ranch wages, men with families are almost always available if comfortable housing can be supplied them. This is especially true if there is opportunity for the women and older children to obtain work a portion of the time. During the past five years those who have had generous housing facilities for married men have had few labor problems of any kind.

More Dependable

Taken as a class the married man is more dependable than his bachelor brother. He is more willing to do a full measure of work each day, takes better care of his team and implements, and is more disposed to apply the same principles of thrift and industry to his employer's interests that he would apply to his own. On the average he is an older man with more mature judgment and, given an opportunity to live in respectable quarters with good school facilities, steady employment and a wage that will enable him to save something above his living expenses, he is the ideal workman in agriculture.

Joy for Once for Farmer

The excessive rents that prevail just now in our towns and cities are decidedly favorable to the rancher who is in a position to offer an employe a house at a nominal rental or perhaps no rental at all. If free water and a garden patch is added, so much the better.

Throughout the ages the actual tiller of the soil has been caricatured as the clodhopper, the hayseed, the country jake with long hair and long whiskers, big feet and slovenly attire. Though the fruit of his toil has supplied every luxury for others, it has been his lot to eat the plainest of fare, to wear the cheapest of clothes and to occupy the humblest of dwellings. Yet withal he has been the world's very symbol for genuine honesty, hospitality, industry and morality. And half the world has been foolish enough to imagine this tiller of the soil has been perfectly contented, satisfied with his attainments, satisfied with his living conditions. Nothing could be farther from the facts. He has worked his long hours and lived modestly and without conveniences, ever sustained by the hope that he might not always have to live thus. When he was not an owner he saved and dreamed of the day when he would be an owner, and when he became an owner he cherished a vision of that new house with modern conveniences, a more complete education for the children, a safe bank balance and a hired man to do part of his work so that he himself might have more leisure for seeing the world and sharing in its wider problems.

Hoover Says:

In a recent magazine article Herbert Hoover made substantially this very true and significant statement: "All human effort, when reduced to its final analysis, is exerted to improve living conditions." If a man is worth anything at all he will be discontented if he is not steadily improving his condition. His fellow men are disappointed in him if he has no incentive to this end. When he takes employment he does so with this as his objective, and if he is disappointed he is quickly dissatisfied and either seeks other employment or works perfunctorily without interest or loyalty.

Me for the City

If we cannot dispute this reasoning we must admit its soundness. It follows, therefore, that if agriculture cannot offer to those engaged in it substantial evidence that they will better this condition, then agriculture will want for its sustaining workmen. If the farm laborer cannot own or rent a home near where he works he will seek other work where he may rent or buy. If he is offered accommodations that have no conveniences, are poorly built and exposed to the free entry of the weather and the rats, he may possibly accept them, if he is "broke," but only until he can improve his condition by securing something better. Every one of you, fellow citrus growers, would do exactly the same thing, and if you were offered such accommodations three times in succession you would probably resort to the vernacular of the street and say to all the world, "To hell with your ranch work—me for the city."

Some of us think that a house is a house even if it is only a shanty built 50 years ago, but how many of us think an automobile is a real auto unless it is the latest model? If a lot of you citrus growers and walnut growers and bean growers and grain farmers and all other ranch owners would drive that splendid old car an extra year or two, you could build the hired man a real nobby house that he would want never to leave, and, furthermore, you would have something to show for your money. Your neighbors would think more of you and, what is more to the point, the hired man and his whole family would think more of you because they would feel that you think more of them. And above all, you would think more of yourself.

More Homes

If we have vision enough and courage enough to plant our fields to intensive crops we should not forget that only the labor of human hands can crown the undertaking with success. If we are not disposed to subdivide these acres into family units and sell them to those who will build their own homes and will do the needed labor themselves, then we must provide the homes for those we hire to perform this labor. These homes and the prerequisites that go with them, together with the wages paid, must compete favorably with the attractions offered by other industries, principally in the cities. Except where such an equilibrium is generally established the supply of farm labor will be short and constantly diminishing. This may require readjustments of the prices which the public must pay for agricultural products, but the public must be fed as well as keep its factories running.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

MEAT WEEK

This has been Meat Week. Presumably we have been living on liver and oxtails. If so, we have lived well. But in watching the meat corner there hasn't appeared to be any great reduction in the demand for porterhouse and loin cuts.

CONTRACT TREES

Nursery trees will be in more limited supply next year than they have been in the past. The price will he no lower; it may be considerably higher. One thing is sure; the wise planter will anticipate his needs and place orders today, and today does not means tomorrow in the matter of next year's fruit trees. We understand some nurserymen have already reached the stage of making their promises for next season's delivery with certain limitations.

WATER RUNS DOWN HILL

In speaking of reclamation of the West William J. Bryan gave warning to those who would use any development along this line made by the will of all the people for purposes of private profiteering. "I warn you not to take this great power out of the hands of the people or deprive the people of the blessings which will come through the cooperative spirit in the wonderful development of the West. There is one lesson the American promoter must learn: 'Water will run down hill.' And equally as sure will hlight come if these great projects are used in exploiting the people."

Fortunately we are learning the lessons of cooperation.

REPORT THE CROPS

How are the apricots, almonds, apples, herries, peaches, pears, prunes promising as to the coming crop? It's the time of the year when the shipper, the canner, the dryer and the grower are all asking the same question. It is too early to give definite answer, but approximations may be made with most of these crops, so we are asking our subscribers to look over the trees in their own neighborhoods and send us the best estimate which can be made at this time. Will it be a half, three-fourths or full crop? We have seen apricot orchards loaded; we have seen others with a lesser crop. In the Santa Clara Valley rains came at blooming time. "Not a third of a crop" is one man's guess. Ventura County promises better. Southern San Bernardino County and northern Riverside County were caught by frosts. "Crop greatly reduced."

But we will await letters from our subscribers some of which we hope will come in time for next issue.

STANDARDIZING

Director Hecke of the state department of agriculture has given out the information that a great step forward has been taken in standardization. It is in effect a great cooperative movement between the county, the state and the federal officials. Until state legislation permits more effective methods, this will result in fairly close cooperative effort. Heretofore there has been too much independent work on the part of county officials, again, on the part of state officials, and sometimes, federal officers, all working on the same problem. Now there will be cooperation, even in local matters. This cooperation is not only along the lines of work but in compensation. Conditions in the federal department and the state law unite in securing underpaid officials, which has resulted in continual loss of effective helpers. Through more recent arrangements combined compensation will secure more efficient service.

The best feature of this combination will be in giving assurance to Eastern trade of thoroughly dependable stock leaving this state. As noted in another column, F. W. Read, formerly in charge of the bureau of markets work in Los Angeles, will be transferred to state work and take charge of state standardization. He will not, however, be in active control at Sacramento until May 24.

PLANT FIGS

Figs are in the dumps. Last year many sales were made at 15 and some even at 20 cents. The offer for the 1920 crop is around five cents. It is claimed that there are 2,500 tons of the 1919 crop yet unsold. This is nearly one-third of the crop of the San Joaquin Valley. Because of this situation we have a suggestion for the orchardist. This suggestion is: "Plant figs."

Californians often follow the practice of planting trees or crops, which require years to come into bearing, on the impulse of a moment. Today while prices are high everybody plants; tomorrow's discouraging conditions induce even the uprooting of those which were planted, and so we bat the shuttle back and forth.

California grown figs are staples. We have lessons yet to learn in curing and marketing. Western Asia still can teach us how to cure these figs, and Americans are bright enough to learn. Let us grow more of the best.

Years ago George Roeding wrote an article for the columns of the California Cultivator. It had to do with the planting of peaches. Mr. Roeding recommended planting more of the best varieties. In the same breath he admitted that the most fortunate of dried peach producers had been selling around two cents per pound. He appealed for greater care in pruning, producing a finer output, great increase in the amount of peeled peaches, for peaches are a staple which the world will continue to demand. Those two cent peaches became 20 cent peaches last year.

Now will not this story be repeated by our fig growers?

In any case, to repeat a homely illustration, "Let us use that thing on top of our shoulders for something besides a hat rack."

INFLUENCING LEGISLATION

Now comes the national chamber of commerce with a resolution "that it is necessary for the business interests to have a home in the seat of national government." As a reason: "The tremendous influence which organized labor has exerted in national legislation is largely attributable to the fact that the American Federation of Labor has a large building in Washington in which all of its various memberships and activities are housed and centered."

In addition the farmers of the land are erecting a great building in Washington "to influence legislation." Why not commerce? The commercial building is to cost $3,000,000. It should be quite influential.

Perhaps it is not strictly a parliamentary suggestion, but, for what it is worth, here it is. Why not secure our legislation directly through these large interests which build large and imposing buildings at our legislative headquarters? Why is a congress? Apparently not to look into the needs of the country and then meet those needs with sane legislation, for according to the confession of these large interests it is necessary to use certain influences to secure that which should belong to all the people. We, the common people, are a peculiar set and we will continue to take a lot from our friend the legislator.

CARELESS HABITS

We note in an Eastern publication:

"He stated that an investigation of the California statistics resulted in the discovery of a great many fires due to using lighted incandescent lamps upon extension cords for bed warming purposes. The practice seemed to be confined chiefly to that state."

This may he intended as a slam on California climate, but we will have to admit that this practice is sometimes followed. A few homes burned will perhaps aid in correcting such habits, though it must be confessed we will continue to he more or less careless in regard to fires. The farmer whose buildings were constructed half a dozen years ago and who has had no experience in buying lumber and plumbing within recent months has no idea of building costs, hut if he will accept a hint from the Cultivator he will make every possible provision against the day of replacement of fire losses. Besides the buildings there are the fields and the forests. It has not been a very wet season; let's all he careful.

Let's be awfully careful.

PHYSICAL EDUCATION

Senator Arthur Capper is pushing for a bill "To provide for the promotion of physical education in the United States through cooperation of states, etc." In a personal letter Senator Capper writes:

"The propriety of this legislation has heen suggested to me by the draft statistics showing more than one-third of our young men disqualified from full military service and by the reports of investigations showing a large percentage of our school children suffering from remediable physical defects.

"I am opposed to compulsory military training but helieve that universal physical education in the schools will give the youth of the country most of the practical benefits argued for military training without the insidious undesirahle effects of compulsory military training; furthermore, physical education in the schools will benefit the girls of our country.

"I believe that legislation of this sort, while providing federal assistance and stimulus, should fully safeguard state autonomy in the administration of education and health matters."

We believe there is need of encouragement of physical education The number of young men who failed to pass the physical examination was appalling. There should be encouragement of this movement to bring the standard up, this not so much as a military as a peace measure, hut—and we are sure the but should hegin with a capital—so long as the bill calls for "an appropriation of $10,000,000 for the first year, and for each subsequent year an amount sufficient to allot one dollar per child of school age to each state which shall have accepted the provisions of the act," it appeals to us that in these times of Hi Cost, Hi Taxes, and, worse, of depreciating Liberty Bonds, that Washington should give every encouragement to the economy it is recommending. The country seems going wild in the matter of expenditures, and the cue is being given to the rest of us every day by officialdom in Washington. It is reported that there are thousands of unnecessary clerks and attaches in every department, and certain it is that while Washington is recommending most severe economies in the matter of print paper, it is sending out literally thousands of tons of paper in the form of propaganda, and unfortunately at times purely political propaganda, until we, the common people, are compelled to ask, "Where is the end?"

Perhaps Senator Capper may raise the point that the suggestions we are making have no connection with his bill, and doubtless it is intended to be of material benefit to the mass of the people. Still the question will persist, "Where is the end?"

CAN'T BE BORROWED

Speaking of federal farm loans there is one kind of capital which land banks can't supply, that is intellectual capital, the biggost factor in money making on the American farm

Copyright 1920, by The Goodyear Tire & Rubber Co.

"THE use of Goodyear Cord Tires on our trucks enables us to load fruit at the trees and deliver direct to the packing house without resorting to slow team hauling at all. The heavy sand in the groves makes it an utter impossibility to use solid tires in this work unless loads are transferred from teams to trucks at the road, a wasteful method."— W. F. Belcher, Packing House Manager, John S. Taylor Company, Citrus Fruit Packers, Largo, Florida

THE all-round ability of Goodyear Cord Tires on trucks, as evidenced in many cases like this, reduces much farm work connected with hauling, as well as the actual time, labor and cost of the hauling itself.

A truck on the tractive Goodyear Cord Tires easily penetrates the plowed, miry and sandy interiors of farms, whereas a truck on solid tires, handicapped by lack of traction, must have crop loads brought to it at the roadside.

Where men's shoulders must help budge sticking wagon wheels and horses are injured by hard pulling, the gripping Goodyear Cord Tires roll through easily, quickly and quite smoothly.

They are here, there and everywhere, keeping up with pickers and threshers, supplying grinders and cutters, doing chores between hauls and going to town and back with a saving of time that is intensely valuable.

All their advantages, curtailing manual work and assisting motor work on the farm, are combined with an extraordinary toughness by Goodyear Cord construction, a result of that thought and care which protect our good name.

The farm records of many sets of Goodyear Cord Tires, detailing savings effected and mileages ranging from 12,000 to past 35,000, can be obtained by writing The Goodyear Tire & Rubber Company, Akron, Ohio.

GOODYEAR
CORD TIRES

Dried, Evaporated or Dehydrated?

By Arthur W. Christie

THE removal of moisture by drying in the sun has been used as a method of preservation for fruits and vegetables since Biblical times. We are now witnessing the phenomenal growth of a new industry which bids fair to disturb and possibly to overshadow the earlier methods. This industry proposes to dry our fruits and vegetables by artificial means and not to depend on "Old Sol," who sometimes forsakes his disciples. A large number of drying machines of varying construction have already appeared on the market, and frequent additions to the family are reported. A variety of terms has been used in naming these machines as well as their products. The most common terms are "dryer," "evaporator," and "dehydrator." Since there are no well defined distinctions between these various terms the use of a number of different terms meaning essentially the same thing is confusing.

This confusion was most noticeable at the recent convention on evaporation of fruits held in San Jose, February 7, 1920, under the auspices of the agricultural extension division of the University of California. Several of the speakers used the terms "dried," "evaporated," and "dehydrated" indiscriminately, it being often impossible to ascertain the speaker's real meaning. In order to clarify the terminology used in fruit drying a committee on nomenclature was appointed by the chairman of the convention, Professor W. T. Clarke. The committee included in its membership a representative of the agricultural experiment station, the United States department of agriculture, and several men closely in touch with the commercial aspects of the situation. The membership of the committee was as follows: Chairman, A. W. Christie, University of California; P. F. Nichols, E. M. Sheehan, S. C. Simons, H. C. Rowley.

After thoroughly investigating the nomenclature of dried fruits and vegetables as well as the various devices for their production, this committee makes the following recommendations:

The same drying nomenclature shall be applied to fruits and vegetables.

The term "dried" is applied to all fruits and vegetables preserved by removal of moisture, irrespective of the method of removal.

There are but two general classes of dried fruits or vegetables, namely, those dried principally by solar heat and those dried principally by artificial heat.

The class dried principally by solar heat shall be designated "sun-dried," by which is meant the removal of moisture by solar heat without control of temperature, humidity or air flow.

The class dried principally by artificial heat shall be designated either "evaporated" or "dehydrated." The committee finds at this time no sufficient reasons for distinguishing between "evaporated" and "dehydrated." These two terms are synonymous and may be used interchangeably.

The above recommendations were first submitted to the college of agriculture of the University of California. Dr. H. J. Webber makes the following statement:

"The nomenclature proposed by the committee has also been adopted by a committee of the college of agriculture of the University of California for use in their publications on dried fruits and vegetables."

The nomenclature committee recommends that the above definitions be adopted by all concerned. The committee feels that this would largely eliminate the existing confusion.

COOPERATIVE CANNING PAYS

The best proof of the success of a business is the results obtained. The efficiency of a manufacturing plant is determined most surely by the record of its operations.

What would be your opinion if you were told that a cannery packed upwards of 12,000 tons of fruit and vegetables in one season, a total of over 300,000 cases, containing nearly 7,000,000 cans; that the customers of the cannery have repeatedly expressed their satisfaction with the quality and grade of the products; that the producers of the fruit and vegetables would receive for their fruit practically $150,000 more than they would have been paid by other canneries; that additional profits had been made which have been used in the creating of permanent capital investment? A fair answer would be that it is a remarkable record. In the light of the conditions which surround the operations of the particular cannery which accomplished these results these facts become little short of phenomenal.

The California Cooperative Canneries broke ground for the big plant at San Jose on April 4, 1919. On June 12, with construction work going on at full blast, the canning of cherries was begun. This was done at the urgent insistence of a few growers who had suddenly discovered that the market for their fruit had dropped out from under them. Under the most unfavorable of conditions 116 tons of cherries were handled and the growers were paid 8 cents for the fruit upon delivery. When the season is closed they will be paid additional amounts which will bring the average for all grades of fruit to a little better than 12 cents, or twice what commercial canneries were offering when the announcement was made that the Cooperative Cannery would handle cherries.

With construction work in progress and continuing almost to the close of the fruit season, the canning of apricots was started on July 7, 1,637 tons of 'cots were put through the cannery, a flat price of $50 was paid upon delivery, and the average return to the growers for all grades will be approximately $115 per net ton. Some growers will receive as high an average as $135, the price varying according to the quality of the fruit delivered. These figures bear favorable comparison with the prices paid in other sections of the state, ranging from $... to $75 per ton, and even compare favorably with the prices paid in the Santa Clara Valley itself where the leading canning interests paid as high as $100 per ton, and some of the smaller concerns had to go even higher to secure their fruit. Would it be out of place to suggest that possibly the reason the prices in the Santa Clara Valley were $25 or more higher than other sections of the state had anything to do with the operations of the California Cooperative Canneries.

When it came to peaches the Cooperative Canneries handled about 50... tons of local fruit on a cooperative basis for which an average of over $100 per ton will be realized, but the local canneries were competing so strongly for fruit and paying such high prices for cling peaches that in order to operate the big new cannery at its capacity it was necessary to go down into the San Joaquin Valley and purchase enough peaches. The big Visalia pool was still unsold. It amounted to about 7,000 tons and the best prices that had been offered up to that time were from $75 to $80 per ton and those only for small portions of the pool. The big interests did not even bid although they had several plants close at hand to handle the fruit. Possibly they thought that they could buy these peaches to better advantage if the growers were forced to deal with them as individuals instead of through their association. At any rate the representative of the Cooperative Cannery appeared on the scene and offered to buy the whole pool at a price of $92.50 per ton for the clings, and $55 for the freestone. The growers accepted this proposition and thereby saved for themselves at least $15 per ton (some of the growers say even more than that).

The California Cooperative Canneries had taken a big job on its hands and predictions were freely made from the side lines that they would not get their money, etc., etc. Well they did get boxes enough (some growers even say that it is the first time

Champion
Dependable Spark Plugs

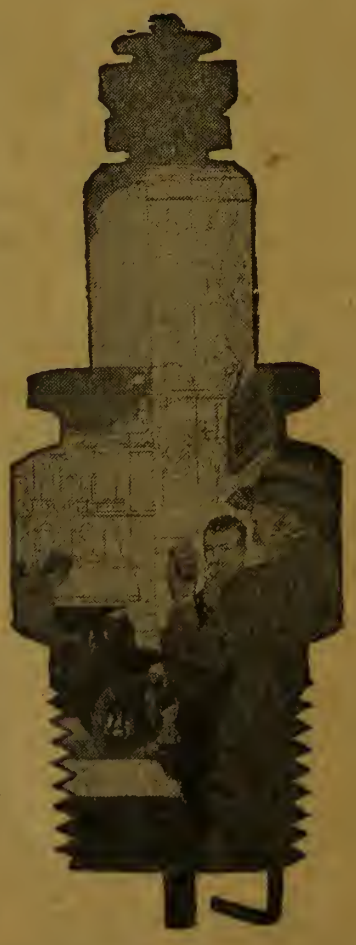
Factory Equipment on Ford Cars Since 1911

A LONG time ago, in 1911, the Ford Motor Company chose Champion Spark Plugs as best adapted to the requirements of the Ford Car.

The judgment of Ford engineers is summed up in the Ford Motor Company's instruction book as follows:

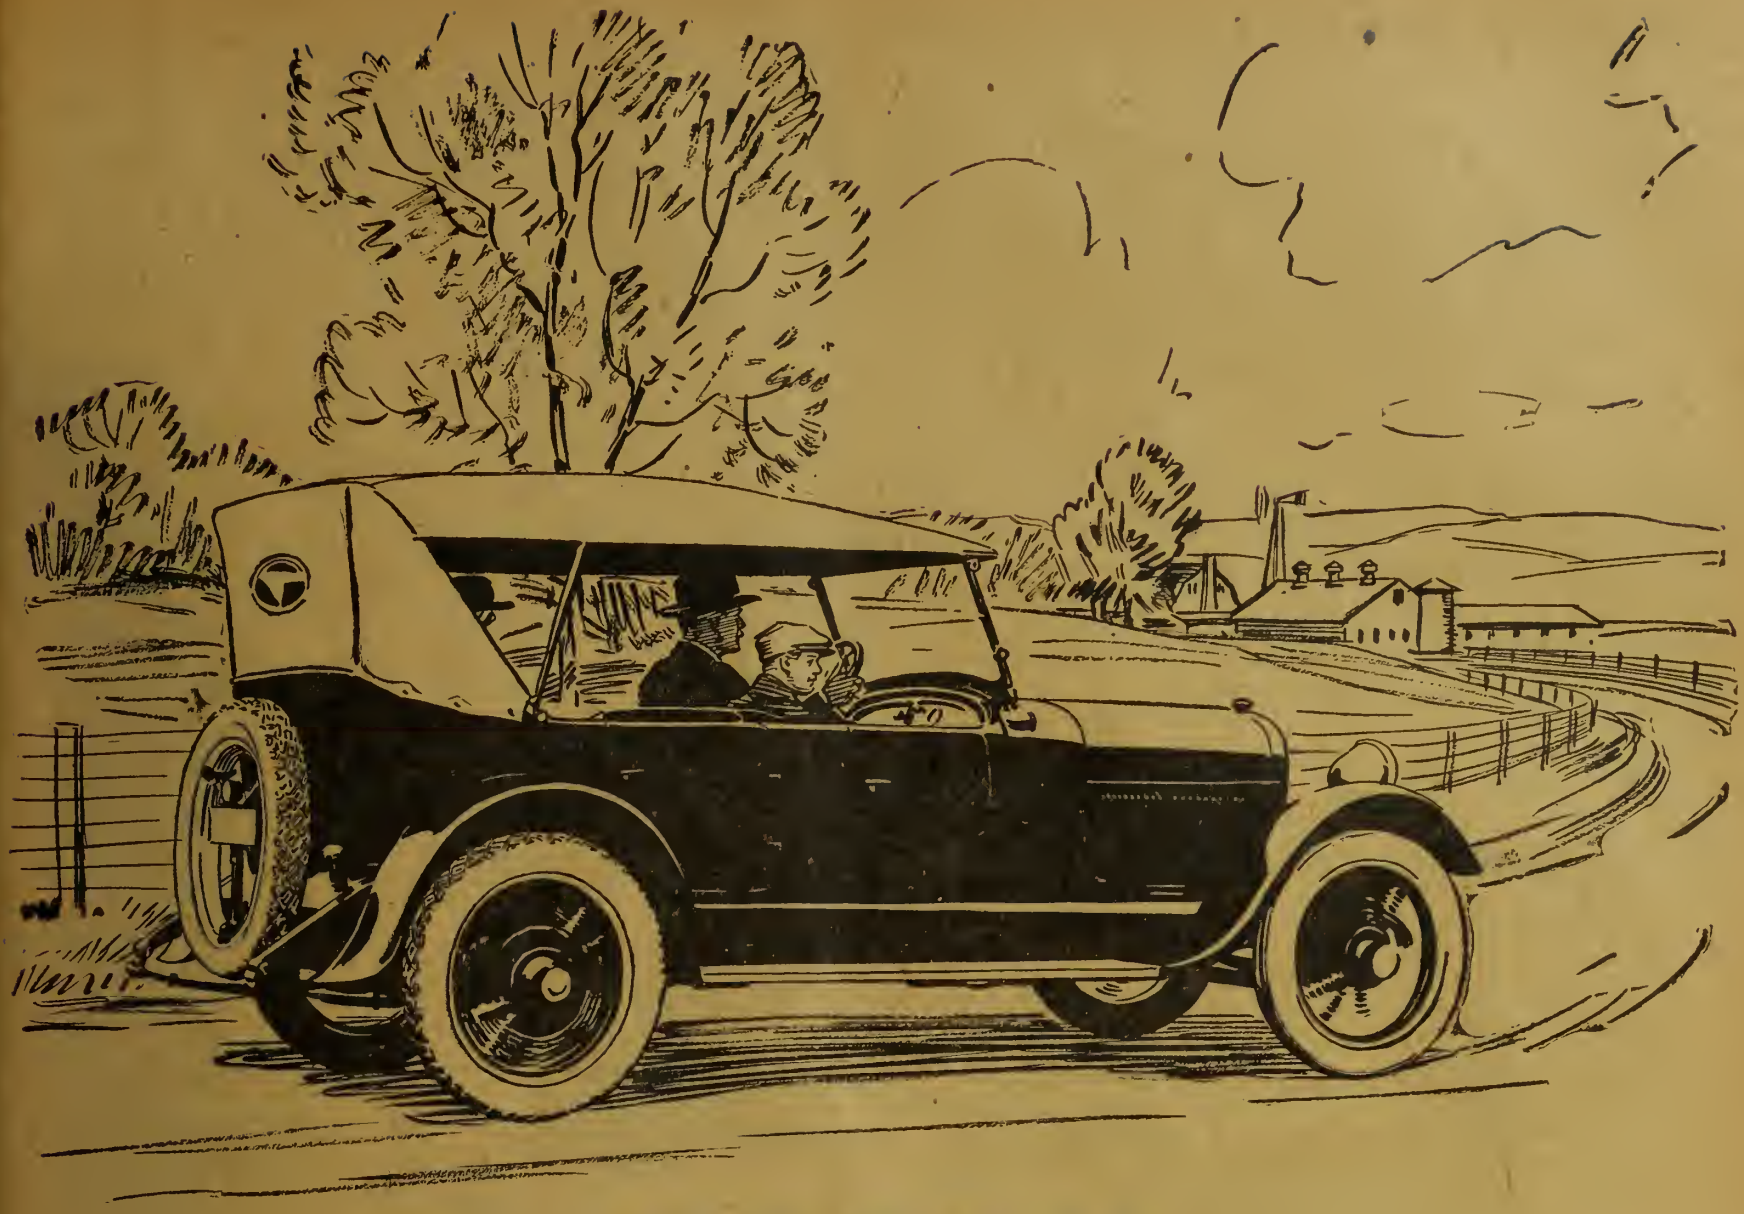
"There is nothing to be gained by experimenting with different makes of plugs. The make of plugs with which Ford engines are equipped when they leave the factory are best adapted to the requirements of the motor."

There is a Champion Spark Plug for every type of motor car, truck, tractor, motorcycle and stationary engine. Order a set from your dealer today.



Be sure the name Champion is on the Insulator and the World Trade Mark on the box

Champion Spark Plug Company, Toledo, Ohio



PAIGE

The Most Beautiful Car in America

The True Meaning of Economy

Webster defines Economy as the "wise, careful administration of our affairs". Please note that word, *wise*. Also note that there is no reference to cheapness or frugality.

In this definition you will find the proof that Webster was not merely a master of the English language, but a philosopher as well.

The cheap expenditures are never the wise ones. The near-wool clothing, the "marked down" shoes and the cut price harvesting machinery cost less to be sure—*in the beginning*.

But cheap clothing shrinks to boy's size in the first spring shower. The cheap shoes wear out after a few months of service and the cheap harvesting machinery fails you at the critical moments. So—in the long run—your cheap purchases become shockingly expensive.

And so it is with a motor car.

There are many cars that sell for less money than the Paige. We could readily build them ourselves if we considered that policy the best one. But we don't.

We firmly believe that Self-Respect, Comfort and Enduring Satisfaction have an actual market value. So we build those things into our product.

We take just a little more time—just a little more care in selecting materials—just a little more pride in our work. And the result is a *real* motor car—not a makeshift or compromise.

Unless we are greatly mistaken the new "Glenbrook" five-passenger model is just the kind of car that you want. It is built to *endure* and it is worth every penny of its price.

If you are truly Economical—truly wise and careful—it will be the car of your choice.

PAIGE-DETROIT MOTOR CAR COMPANY, DETROIT, *Michigan*

Manufacturers of Motor Cars and Motor Trucks

they have had enough boxes); they did get the cars there; they shipped the bulk of the fruit nearly 300 miles, canned it, sold it, and the growers have received all of their money. It took nearly 300 refrigerator cars to handle this fruit, it took 130,000 new picking boxes, and they all had to be shipped from the mills and made up within less than two months; it took a big force of field men, car loaders, receivers, hox makers, etc., not one of whom had been in the employ of the concern before the fruit was purchased. But the job was done, the growers received their hig prices, upwards of $40,000 was paid the railroads and for handling the fruit, and still the canneries made a profit of over $60,000.

It is not surprising that the Visalia growers have been doing some figuring and have discovered that they could have built a cannery, kept their fruit at home and paid for the cannery and more besides out of the profits they would have realized. They are proceeding to do this very thing before another season rolls around.

Sulphur and Crop Yield

By R. A. Ward

THE alfalfa lands of this country have also responded quickly to the use of gypsum as a fertilizer. The gypsum, however, was rapidly exhausted and had to be applied at least once every year. Experiments conducted by the Oregon experiment station, and particularly by Mr. Reimer of the hranch experiment station at Talent, Oregon, showed that a large proportion of the benefit derived from the gypsum was due to the 18 pounds of sulphur which it contained and not to the 82 pounds of lime. Mr. Reimer also secured some wonderful results in the Medford country by the use of pure flour of sulphur on alfalfa Following this lead, the office of county agricultural agent experimented with a few sulphur demonstrations in Des Chutes Valley two years ago. The results were so gratifying that the demonstrations were enlarged, during the past season, to take in ahout 15 representative farms.

The soil of Des Chutes Valley contains about six per cent lime, while it is our understanding that the average lime content for the earth's crust is about two and one-half per cent. This being the case, it was poor business on our part to apply gypsum, when the benefits we were deriving were undoubtedly due to the sulphur which it contained. The sulphur in the gypsum being in the sulphate form, was rapidly consumed and exhausted by the plant. In applying the pure flour of sulphur, this form is broken down gradually into the sulphate form and the process may take two or three years. During this time the beneficial results of the sulphur continue.

Our first applications of sulphur were at the rate of 200 pounds per acre. When applied very early in the season, that is, before the first growth of alfalfa started, the crop increase on each cutting was remarkable. In some cases this amounted to an increase of 100 to 150 per cent on each of the two alfalfa cuttings, not only during the first year it was applied, but also in the second and third years after application. Professor W. L. Powers of the Oregon experiment station reports the beneficial effects carrying well over into the fourth year in Klamath County. This was a great point in favor of the sulphur. If we could apply it only once in three years the cost of lahor and materials would, of course, be greatly reduced.

The sulphur requirements of alfalfa are much heavier than has been commonly supposed. It is generally recognized today that the amount of sulphur in plant materials, as determined in the ash, is in most cases entirely too low. Analyses by the Osborne method show that the alfalfas and plants of the cabbage family are fairly heavy sulphur consumers. It is held by some investigators that sulphur may be what is known as a limiting factor in plant food supply. That is, there may be sufficient nitrogen, phosphate and potash in the soil to produce a yield of alfalfa of five tons to the acre, but there may be such a great deficiency in sulphur that this five ton yield can never be obtained until this sulphur deficiency is supplied. Our demonstrations seem to hear this out. We have several trials where the yield per acre has been brought up to five tons on land which formerly never exceeded two to three tons per acre per year.

In cooperation with the Oregon experiment station we have conducted trials with the sulphur in comparison with gypsum, nitrate of soda and superphosphates, and in every instance the sulphur treated areas have yielded the greater amount of hay. One trial was conducted in comparison with gypsum applied during the current year against sulphur applied in 1917. The sulphur plot outyielded the gypsum plot by 1,000 pounds to the acre.

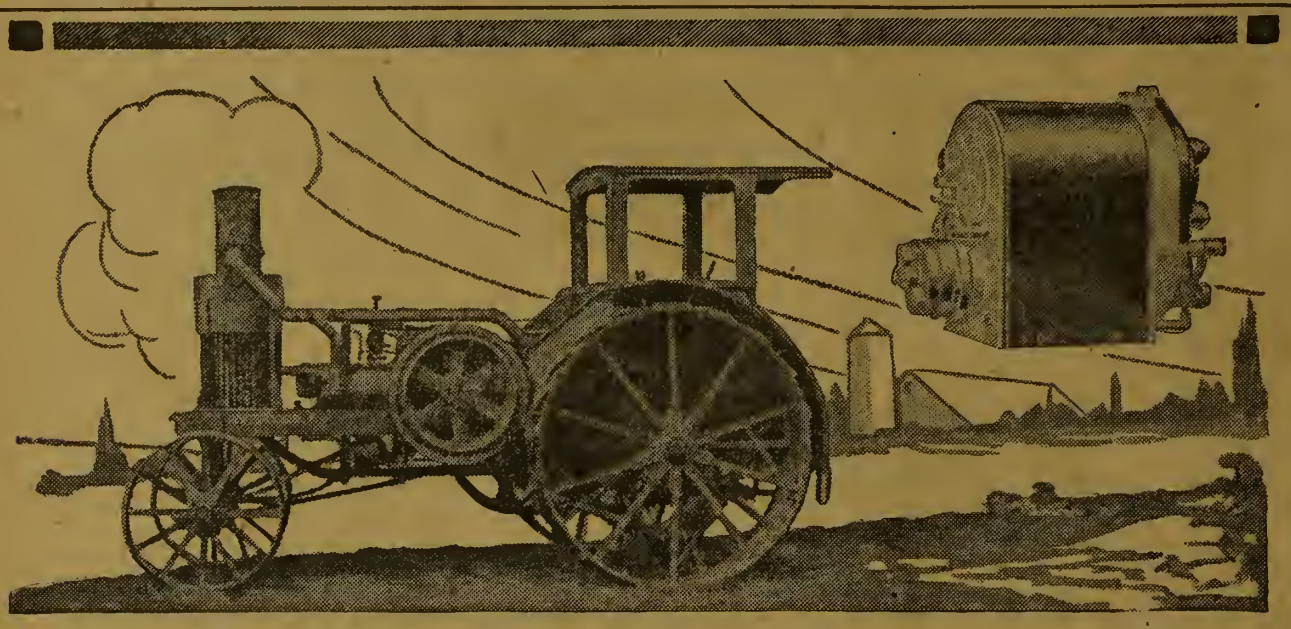
Seven conclusive experiments completed to date have shown an increase in the yield of hay from the use of sulphur as a fertilizer, ranging from 90 to 150 per cent. Farmers were urged to visit the plots and see the results themselves, or else assist in weighing the experimental yields. The results of the demonstrations were so conclusive that it was decided to make a direct application of them to the entire alfalfa crop of Des Chutes Valley. Accordingly, the Sulphur Alfalfa Club was organized. Members of this club agreed to take at least 500 pounds of sulphur, and as much more as they wished, and use it on their alfalfa fields during the coming year. They also agreed to report to the county agent the results they obtained by comparing, whenever possible, the yield on five acres of sulphur treated alfalfa land with the yield on five untreated acres. Membership blanks were prepared and arrangements completed for securing a community shipment.

The first community shipment brought in amounted to about 180,000 pounds and was secured at a direct saving to the farmers of ahout $2.000 by purchasing in large lots direct from the producers. This shipment did not suffice to meet the needs of all of the alfalfa growers so that at present another shipment of 80.000 pounds is being made up. The total shipments will treat about 3.000 acres of alfalfa, and from the conclusive experiments which have been conducted during the past two years. will result in an increased hay yield in Des Chutes Valley of at least 3.000 tons. This is a very conservative estimate, as actual trials sbow that the increase in many instances will be more than one ton to the acre per annum. At present hay prices of $20 per ton for alfalfa in the stack, this will mean $60,000 worth of new crop in Central Oregon next·year.—Better Fruit.

ORANGE PROBLEMS

By John E. Wilbur

"BUD Selection—Stock Selection—Efficiency," hy C. B Messenger, in your issue of March 20, 1920, has been read with a great deal of interest by me, as I lived in Florida and helped pack one of the first cars of trees that was shipped to California. I lived at South Lake Weir then and the Gillett Brothers were the shippers. The Gilletts only had a small nursery that year of about 35.000 trees and they were budded with such trees as the demand called for in Florida. Among them was your famous and now much sought after Valencia, known to us as the Hart Late of Federal Point, Florida. I met in Florida several years ago a man from California who told me he hought one of these Hart Late trees from the nurseryman who bought them here. When this tree began to hear it ripened in August and a hrother of his budded enough trees from this tree to plant five acres. When the grove came into bearing the fruit was shipped to New York. It came in at the same time as the Valencias from Spain and as the shape and size of the California orange was nearly like the fruit from Spain, they dubhed it Valencia, and this name stuck to it. Now all the Hart Late oranges from Florida use the same name.



READ this leaf from the tractor experience of Frank Gerry, St. Charles, Minnesota, who bought the first Avery Tractor back in 1911.

There are thousands of tractor owners like Mr. Gerry who would be just as surprised and enthusiastic if they once tried a K-W Magneto—because it is specially designed for tractor service.

The first tractor manufacturers had much to contend with. The Avery Co. early appreciated a magneto specially built for tractor work—became one of our first customers and have used K-W Magnetos continuously.

If your tractor is not working right—try Mr. Gerry's plan—ask us to equip it with a K-W Magneto.

THE K-W IGNITION Co. CLEVELAND, OHIO, U.S.A. 2895 Chester Ave.

The Story of Ignition On The First Avery

"I bought the first Avery Gas Tractor that they sent out in the fall of 1911 and used it till the fall of 1919, when I sold it and bought a new 25-50 Avery.

"My first tractor was equipped with an ..... Magneto when I got it and it did such unsatisfactory work that the company replaced it with a ....., which did very well, but was of such delicate construction that it failed to stand up to the rough usage a Magneto gets in tractor service and was replaced with a .....

These outfits did what I supposed was good work until I bought a small tractor for field work equipped with a K-W High Tension Magneto, and after operating it a few days, I got a K-W Model TK Magneto and put it on my Avery rig, and in all the time I ran it, it never failed me once starting or in running under any weather conditions.

"The 25-50 Avery I now have came equipped with a K-W Model HK and gives the very best service."

About 20 years ago M. E. Gillett started the Buckeye Nurseries at Winter Haven. He sent to the Teague Nursery at San Dimas for 1,000 Valencia buds and got 153 trees in his grove to live from these buds. He also budded in this grove about 500 trees of the Hart Late. When they came into bearing you could detect little if any difference in the fruit, only that about six trees of the California Valencias were nearly seedless and rather less thornless. From these trees he has selected bud wood from year to year until he has trees in a 1,000 grove under his care that are almost entirely seedless. From these trees he is budding his trees now that he sells as Valencias. They are also very full bearers.

The method used by the Buckeye Nurseries to obtain plenty of budwood where buds from the bearing trees are scarce is to bud, say 2,000 trees in the nursery rows with the varieties wanted, then when they sell the trees they cut off all the wood that will do as budwood and pack it away in sawdust until needed to bud with in the spring. They generally keep these 1,000 trees in the nursery until they are two years old. The reason they use this method is that they cannot get the right kind of budwood in the spring, as the trees are all started. In the fall they are full of fruit but enough can be obtained to bud the nursery trees. This gives a very vigorous eye bud and one that makes a very good growing tree, and if anyone would follow up the bearing of these trees they would find them good strong bearers.

The sweet seedling in Florida has always been a shy bearer one year and a good one the next. The sour orange root or the rough lemon root make much the best regular bearers, and if enough fertilizer is used each year to make a good wood growth as well as to mature the crop, then you will get fruit every year.

Deep plowing in an orange grove in Florida has cut short more crops than bad budwood ever did. It also produces there dieback and Frenching, also gum disease. The agricultural department sent out two experts some years ago to travel all over the state to find the cause that produced these diseases. Before they started I told one of them that the trouble was caused by three things—water, too much strong fertilizer applied close to the roots, cutting off the roots with a plow. Six months later I saw the expert and he told me that they found it just as I said.

Dr. Ross, president of the Citrus Exchange, and who has a fine 80 acre grapefruit and orange grove at Winter Haven, said in my presence a few years ago that he had discovered that plowing his grove late in the fall and cutting off more or less roots injured his crop of pineapple oranges so that they began to dry up a month before they should, and he doesn't use a plow any more in his grove.

MORE PEARS

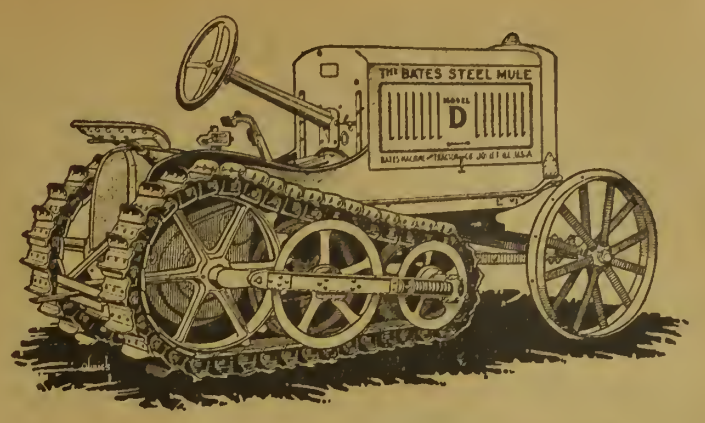
We recently gave figures as to pear production, quoting from Vol. V, No. 3, of the Monthly Bulletin of the state commission of horticulture. These were observed by C. F. Kinman, pomologist of the U. S. department of agriculture, and he writes:

As pear growing, like all other branches of fruit industry, has made great progress in recent years, it seems to me that it would be well, by way of correction, to present the figures given on the acreage in pears by Volume VIII, No. 4, of the Monthly Bulletin of the state commission of horticulture. This gives the figures for 1918 and credits Los Angeles County with 834 acres of bearing pears instead of 311; Sacramento County with 3,500 instead of 3,000; while Lake has 700, Placer 2,150, Santa Clara 2,100, Solano 1,500, Sonoma 959, Contra Costa 900, El Dorado 1,000, and Yolo 975.

DADANT'S CATALOGUE

The Dadant Bee Supply House has issued its 1920 catalogue of practically everything needed by the beekeeper. In addition to the supplies listed and illustrated there are points for beginners and hints of value.

Sonoma County grape growers are perfecting organizations and making plans for the selling of the coming grape crop.



Supreme on Seed Bed

THE Bates Steel Mule does its work fast in all soils and under all conditions, but on seed bed work it is supreme.

The broad surface of the Crawlers distributes the weight of the tractor so it does not pack and the twenty-four cleats constantly gripping the ground give it the traction to pull its load at a fast speed.

Bates Crawler Shoes have hardened steel parts and are 100% oversize—that's why they last for years.

The front wheels make easy steering and comfortable riding.

Protect the Beans

ONE of California's most important industries, bean growing, is being menaced by the constantly increasing importation of Oriental beans. Should they continue to arrive in the same volume as during the past three years, and no relief is given by congress in the way of an adequate tariff, it may mean the practical annihilation of one of the largest and most important agricultural industries in California. The situation is becoming very acute, and, according to those who have made a study of the question, unless a tariff of at least four cents a pound is passed, we will see the passing of an industry which will mean the loss of millions of dollars annually, in addition to the abandonment of thousands of acres of land to less productive and less valuable crops.

The organized bean growers of California have presented to congress an application for a tariff upon foreign grown beans of four cents a pound. At the present time it is 25 cents a bushel. The committee, which went to Washington last October, offered in support of its request the following facts:

During the past four years the cost of production of beans has more than doubled, and in California is in excess of 6½ cents a pound, while in the Orient the average cost does not exceed 2 cents a pound. The average normal production of beans in the United States is approximately 10,000,000 bushels, while that of the Orient is about 200,000,000 bushels. The field laborer of Asia receives less than 40 cents a day, against $4 a day in this country.

It is stated that the Orient produces a close imitation of nearly every variety of bean grown in this country, the Kotenashi bean being identical with the Small White, which constitutes 42 per cent of this country's production. The Kotenashi bean was sold in San Francisco in 1919 as low as 3½ cents a pound, or about one-half the cost of production of beans in the United States, and is now quoted in every market at from one-fourth to one-half cent a pound below our domestic product.

During 1919 more than 2,000,000 bags of beans were imported from the Orient, and the receipts between July, 1918, and July, 1919, were 20,000,000 pounds a month. The Orient has productive resources sufficient to supply every demand of the American bean market. As a result of this competition with cheap Oriental beans a large proportion of the 1918 crop of this state has found no market, even at prices below the cost of production. This has worked a financial hardship on thousands of growers in this and other states, in some instances bringing about bankruptcy.

Beans are the only important food product which have no ready market and must be carried throughout the season until the consumer is ready for them, and also the only important food product which has been sold at prices materially lower than that of the previous two years, and the only one that has been sold below the cost of production.

There are many reasons why California, as well as other bean producing states, should have this protection. California has grown nearly one-half of the beans produced in the United States; the crop has been second in value to only one other agricultural product in the state and has brought to the state as high as $50,000,000 of new wealth in one year. In many of our counties it is the most important crop and thousands of acres of the richest lands are unsuited to other crops. The bean is the greatest aid in adding fertility to the soil and improves the land for other uses.

There is no question but that the loss of the bean industry through the importation of these from the Orient would cause great loss and harm to banks, merchants and business men generally and its effect would be felt in every channel of trade. The industry can be saved only through a protective tariff sufficient to cover the difference of the cost of production in America and Asia. Those who are interested in the general welfare of the state and its industries should use every means to acquaint their representatives in Washington of the importance of the subject and bring every effort to bear in demanding the passage of an adequate tariff.

It Once was Called "Desert"

The Imperial Valley has about 400,000 acres that will qualify as alfalfa lands, for the grower of lettuce, cantaloupes, onions, or asparagus stipulates that the land must first be used in growing alfalfa. After this period of demonstration it is ready to grow anything, even to savings bank accounts. The same is true of the Coachella Valley. And both are looking to greatly increase the irrigable acreage in the near future. When present plans are carried to fruition Imperial Valley will place the numeral "1" before the figure given and it will read "1,400,000 acres."

R. G. Risser, manager of the crop production department of the California Vegetable Union, was down there last week and states that in spite of the unfavorable weather, both east and west, during the shipping, the lettuce acreage will probably be as great next season as during the past one. But as the planting is done mostly in October it is yet too early to safely predict the acreage. The shipping season is nearing its close. On the day of writing the valley shipped 12 cars; Los Angeles, 29 cars. If there was Eastern market for its lettuce it could be shipped from coastal counties every week in the year.

The Country's Crop

During the past season about 6,000 cars of lettuce were shipped in the United States. Of these about 2,600 were sent from Florida and a like number from Imperial Valley. This was an increase in Florida's production, as against the previous season, of 1,000 carloads. California as a state still leads, for the figures given are for one valley only and do not include the smaller centers of production, both north and south. Some lands cleared of early lettuce are already planted to cantaloupes, though the main crop of melons is growing before lettuce is harvested. But late crops are still going in while the large fields are receiving their first cultivation.

The first of the onion crop is now being shipped, the season opening April 15. About 85 per cent is Yellow Bermuda, the remaining 15 per cent Crystal Wax, a white of the Bermuda type. This latter is a little earlier than the yellow and is preferred in a few markets. Of course the Texas crop, from 12,000 acres, will prove a strong factor in the market to the eastward. Added to this come the unwelcome news that 75,000 bags of onions from Egypt have reached New York. These came by way of Liverpool where they were sorted and repacked. In spite of this precaution some arrived in bad condition. To fight against this foreign invasion the growers of Texas and California should combine and act quickly. The Coachella growers are now experimenting with thrips control through use of dust spray, with very gratifying results. Inspection looking to strict standardization is having its first season in the valley, a gratification to every good grower. The general requirements they have always voluntarily complied with and now the slackers must also make good. These inspectors are appointed by the Riverside horticultural commission and paid by Riverside County, but they have the cooperative guidance of the state department of agriculture.

E. B.

When Writing Advertisers, Mention the Cultivator.

TOBACCO EXTRACT

The state department of agriculture has issued statement as to various nicotine or tobacco extract commercial mixtures. The statement shows percentage of nicotine from samples which, we suppose, were purchased on the general market. The following are the findings:

Black Leaf 40, 40.8 per cent nicotine; Rose Nicotine, 11.1; Lenox Tobacco Soap, none; Sulfo-Tobacco Plant and Animal Soap, 0.4; Nico-Fume Liquid, 41.7; Floral Nicotine, 12.6.

COST OF ANT CONTROL

The very direct relation of the Argentine ant in the control of mealybugs of citrus trees was demonstrated in 1915-16, in several infested orchards in the San Gabriel Valley of California during an investigation of the common mealybug. The trees rid of this ant quickly became freed of mealybugs and continued in a commercially clean condition, while trees frequented by ants remained severely infested.

The cost of treating orchards for ant control is said to be cheaper than fumigation or spraying, and so low that the owner of infested property can ill afford not to avail himself of this method. In response to a petition of the citrus fruit growers in the Upland district, control measures against the citrophilus mealybug were instituted and a campaign started in September, 1917, in an orchard infested by both mealybugs and the ant. An inspection of the orchard in April, 1918, showed that 98 per cent of the trees of the first half treated were free of ants, and that 62 per cent of the part treated in November were clean.

The effectiveness of the syrup in the first demonstration was so apparent within a few weeks after its distribution that control efforts were rapidly extended to neighboring orchards and by the beginning of 1918 more than 150 acres had been treated. At the present time the ants have become not merely controlled, but totally eradicated over this extensive area.

This ant work has been extended during 1918 by more than 350 acres, practically all of which is in commercial control. An area of approximately 650 acres of citrus orchards practically in a solid block has been subjected to control of the Argentine ant within 18 months following the institution of a demonstration at Upland, and stands as an example of the possibilities in control and eradication of this insect through persistent and concerted action of fruit growers.

The following is the Barber formula for poison syrup, modified to meet arid conditions: Granulated sugar, 12 pounds; water (distilled), 10 pints; tartaric acid (crystallized), 0.25 ounces. Boil 30 minutes, cool, add distilled water to allow for evaporation. Dissolve sodium arsenate (C. P. only), 0.75 ounces in hot water (distilled), 1 pint; cool. Add poison solution to syrup and stir well. Add to poison syrup honey (strained), 2 pounds. Mix thoroughly.

SAVING TOBACCO SEEDS

Whether the present agitation for the restriction of the general use of tobacco will result in lessening the crop remains to be seen, but so long as we plant we should aim to improve. There is no crop where improvement is more easily accomplished, for one good plant will produce seed enough for 12 or 15 acres. Therefore few plants need be saved and great care should be observed in choosing these. Wherein does your crop fail to qualify?

One of the most important factors in California is early maturity, so the plants may be quickly grown. Some varieties mature in three months, others require six. By a continuous system of selection one may gradually come into possession of a crop closely approaching the ideal in the conformation to local demands of soil and climate. Watch carefully the most vigorous and early maturing plants that have the greatest proportion of perfect leaves, right in size and shape, avoiding those bearing narrow top leaves or those too close together on the stalk, for the latter are difficult to sucker and to cure. Remove the lower branches so the upper flower heads may receive the full vigor of the plant. These heads may then be covered with muslin bags if thought necessary to prevent cross pollination.

Specially Designed for the Fordson Tractor

AGRICULTURAL engineers and designers of motor driven farm machinery have proved that better results can be secured from tractor operation by using equipment specially designed for the make of tractor employed.

For the Fordson tractor, there has been specially designed the Little Giant tractor belt — and thousands of farmers have found that it is the most satisfactory belt to use with the Fordson.

If yours is an average farm, over 40% of your tractor work should be belt work. Your tractor can be used every month in the year on some kind of belt driven farm machinery, thus giving you a greatly increased return from your investment in the tractor as well as getting the work done quicker, better and more profitably.

The Little Giant tractor belt is endless and is built of four-ply of extra weight, highest grade canvas, specially treated to increase its toughness and wearability. Another distinct advantage over other belts is possessed by the Little Giant because of its extra stitching especially on the edges which practically eliminates the effects of edge wear. Because of its special design the Little Giant belt will run straight and true, always.

Its slip-proof grip makes possible the delivery of full power of the Fordson to the belt machine and the full benefit of satisfactory performance of thresher, sheller, grinder, ensilage cutter, hay-baler and other power driven machinery.

Your Fordson dealer has a stock of the three lengths of Little Giant belts—50 ft., 75 ft. and 100 ft. If he hasn't, write us direct.

Build Up Your Soil With Whip-Poor-Will Cow Peas

WHAT THEY WILL DO:

They make the best summer covercrop.

Maintain a moist surface mulch.

Will prevent June drop.

Require less irrigation than other crops.

Need no irrigation where soil moisture has been conserved.

Build up poor soils with more nitrogen bacteria and humus than any other covercrop.

Afford the best kind of pasture for cattle and hogs.

As a hay have a food value of 43% more than Alfalfa.

Will improve your silage.

There is no better Bee Pasture.

Thirty pounds of seed is sufficient to plant one acre.

Our seed germinated 96%.

SETTLEMENT OF THE PUBLIC LAND OF THE IMPERIAL VALLEY

(Continued from Cover Page.)

on $200 land will be $10 an acre. If he has to pay 8 per cent, it will be $16 an acre. This difference on 40 acres means $240 a year. It may mean a difference between meeting payments and not meeting them, between a discouraged family and a hopeful, confident one. If a settler gets amortized payments and 20 years time the returns for crops will meet his payments. If he gets a short time loan there will have to be a renewal of mortgages and heavy charges.

Our methods of giving or selling public land in the past have been crude and inefficient. They ought not to be continued. They were wasteful and costly, but would work when land cost nothing and water rights were cheap. They will not work in this area with its costly water rights and heavy expenses in preparing the land for irrigation. Under the old methods there would be no selection of settlers, no adequate advice or direction. It would be a case of "first come, first served." Men who did not need farms or who would fail at farming would get land and thereby restrict the number of worthy and capable settlers. Unwary and oversanguine settlers would be victims of the land shark and the loan shark. The district under this plan would start handicapped by the evils of non-resident owners and alien tenants. There would be high interest rates and slow costly improvement of farms.

We do not have to speculate as to what changes should be made. The methods and policies of the state land settlement act furnish the answer. These should be adopted in the development of this area. Under this act, privately owned land is now being bought, subdivided into small farms, made ready for cultivation and sold to worthy landless settlers on long time payments. These settlers are helped in the preparation of land for irrigation, in planting the first crop, in building houses, in the purchase of livestock, by loans of money at a low rate of interest. In many ways they have been aided in avoiding the mistakes and delays of inexperience. As a result, settlers who started with little money were, before the end of the first year, living in comfortable homes, meeting their payments, cooperating in buying and selling and creating an attractive social life. A new agriculture and a new social fabric are being created. All these valuable results are being secured without any expense to the state's taxpayers.

If this plan and policy is applied in the development of this area, it will men that the vicious land speculator will have no show, that this land will be settled by people of American blood, who have the hope, the courage, and the independence of the pioneer of California. It will mean that the farm laborer will live in his own house, own his garden, will have a position of dignity and self respect that the importance of this calling justifies and which we have hitherto done so little to secure. His children will grow up in comfort and independence and will be the farm owners of the next generation.

Such results are not a matter of theory or happy accident. Methods developed by a quarter of a century of study and experience have been followed. Success comes because success is deserved; because the needs of settlers have been visualized and preparation made to meet them. These settlements mean equality of opportunity. They bring to settlers at the start, the advantages of cooperation and community organization and thus save the waste of an immense amount of money and time.

If this 300,000 acres is settled under the methods of the state land settlement act, preparation for settlement will include:

1. A Soil Survey

The soil of this 300,000 acres is not all alike. Some of it is very fertile and will grow anything which can be grown in California, some of it is underlain with hardpan and some poisoned with alkali. The areas of good, bad and indifferent land ought to be clearly known before settlers go there. A soil survey and a soil map will show these things.

2. A Contour Survey

The value of these farms will depend in large part on the roughness or smoothness of the surface. There are 40 acre farms in this area that can be prepared for irrigation at an expense of less than $25 an acre and there are other 40 acre areas where the cost will be $100 or more an acre. A contour survey will show the smooth and the rough land. It will show where lateral ditches ought to go, the direction in which the borders of the irrigated farms ought to run. It is needed in fixing the prices of the farms and in the development of farms.

3. Planning the Farms

The soil map should be a controlling feature in fixing the size of the farms. The contour map would govern their shape. The rectangular surveys of the government ought not to be retained as the boundaries of the farms. These farm boundaries ought to fit the canals and roads like blocks fit city streets. The farms at Durham and Delhi are so planned. All who live there and all who go there admire the convenience and value of this feature of rural planning.

4. Locating and Planning the Towns and Roads

The settlers on 300,000 acres will not all be farmers and farm laborers. There must be carpenters and blacksmiths, lawyers and doctors. Towns, stores

(Continued on Page 662.)

For Bigger, Better and More Profitable Crops Use

Agri-Gypsum

Your soil may be ever so rich in the elements that are necessary for plant growth, but—

Are you sure these elements are free and available?

Are they in such proportions as the plant roots demand nitrogen, sulphur, phosphorus, potash and the many other elements so necessary to make good crops?

AGRI GYPSUM, by its chemical action with other contents of the soil, makes more nitrogen, sulphur and calcium available—all necessary to plant growth.

Alfalfa Grows Better if AGRI GYPSUM is Applied to the Land

Alfalfa needs sulphur. AGRI GYPSUM contains a high percentage of sulphur. Nearly all soils are deficient in sulphur. Beans, peas, cover crops, beets and many others planted now are greatly benefited by the use of AGRI GYPSUM, especially if the soil is inclined to pack, or contain black alkali. It may be sowed with the crop or put on broadcast when the soil is being prepared.

AGRI GYPSUM is a specific for black alkali, changing the nature of the alkali, and making possible the production of good crops on soil formerly surfaced with it.

Gardens will show marked improvement in growth if AGRI GYPSUM is applied and the grass in lawns and parks, requiring sulphur, nitrogen and phosphorus, will immediately respond with vigorous growth.

Stable manure retains its ammonia when AGRI GYPSUM is applied.

It will pay you to experiment with a little sample on any crop this year, just to see what AGRI GYPSUM will do. Sow a strip across your field and note the difference.

AGRI GYPSUM is made by the largest producers of Gypsum in the world. Be sure of the brand and you will be sure of the analysis and material ground fine giving the best results.

Dealers handling AGRI GYPSUM will be found in all farming sections. If your dealer cannot supply you, write

United States Gypsum Company

HOUSING OF RANCH LABOR

(Continued from Page 649.)

The more completely we study the fundamentals of this problem the more thorough will be our conviction that adequate and respectable homes for agricultural workers in close proximity to their work is the most promising and permanent solution of our agricultural labor problem, not only for this generation but for the next as well. There is not a grower present who would prefer foreign labor if satisfactory and sufficient help at a permissable cost could be secured from the ranks of his own fellow citizens. Better housing conditions will hasten the day when such an ideal can be realized. With the further development of cooperative selling organizations and cooperative purchasing of supplies the elevation of agriculture to the status of a modern industry will be an accomplished fact. Then, and not till then, will it be in a position to choose all of its workmen from the ranks of those who should constitute our future citizenship.

At Limoneira

In closing these remarks it may be of passing interest to call your attention to a ranch labor housing problem with which it has been my privilege to be associated. On the properties of the Limoneira Company near Santa Paula labor is required for some 500 acres of full bearing lemons and about 400 acres of lemons now about five years old. In addition to this citrus acreage there are 240 acres of full bearing English walnuts, some 300 acres of Lima beans and 300 acres of dry hill lands cropped to hay. Near the very center of the citrus orchards are located the lemon packing plant, walnut house, warehouse, barns, etc. Already our labor requirements exceed 400 during the peak load in the spring and never less than half that number throughout the year.

For Mexicans

Five miles from the nearest town, we have had no alternative but to house our labor on the ranch. For our Mexican employes we have 160 family cottages of the common type so familiar to all of you, built here and there over the properties in groups of from ten to 36. We are now erecting 16 more in another group.

For Japanese

For the Japanese, who perform about half of our packing house work and one-third of the pruning, we have three large dormitories, one of which contains 18 apartments. They operate their own boarding house on a cooperative basis. For our single men we have two dormitories situated a mile apart, each accommodating about 40 men, each supplemented by its own boarding house.

For Americans

Up to a year ago we had provided for American families a total of 23 residences and cottages and a group of six plain apartments. They have always been filled with only temporary exceptions and could have been filled twice over while, of recent years, our dormitories have rarely been filled to capacity.

Resulted In Satisfied Workmen

Our experience along this line has been so consistent, year after year, that as our need for help has increased we have decided to increase our housing accommodations for American families to whatever extent satisfactory workmen can be efficiently added to our forces. Putting this policy into effect, we are now completing the first 36 units of a cottage group arranged on the court plan. How far we shall be able to go in extending this group will, of course, depend on the results obtained from this initial development. These cottages are constructed of hollow tile with plastered exteriors. Full plumbing and sewer system, electric lights and gas make these cottages in every way modern and comfortable, even if they are not so very large. We have been unable to complete them as rapidly as they have been engaged, though we have largely restricted occupants to the condition that each family must supply one steady employe at least, two during the heavy picking and packing season. Rentals are nominal, averaging from $8 to $10 monthly per house. Water is free and the front yards are to be parked and cared for at company expense. There is no restriction against children, except that they stay in their own back yards.

Drawing of Limoneira Farm Homes

Contented workmen are reasonably sure when attractive surroundings, as shown above, are supplied.

Company Store

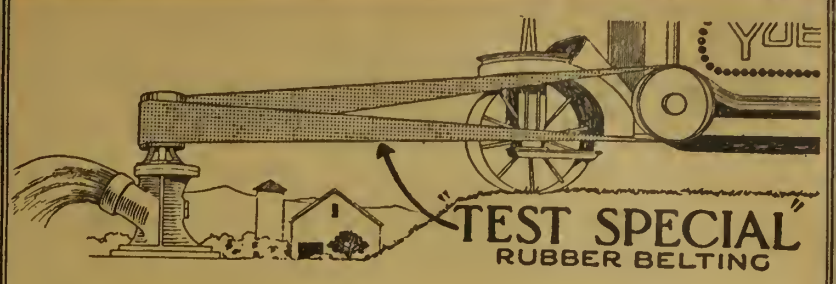
An innovation in our organization within the last week is the opening of a company store where employes only may purchase all staple provisions and a few articles of staple wearing apparel at prices that will pay the operating expenses of the store, and possibly low interest on the money invested, yet net our employes a very appreciable cash saving.

Small Town on the Ranch

Out of regard for the business interests of our local merchants we have deferred as long as possible the opening of this company store, but now that there are over 200 families on the ranch we are assuming the character of a small town all by ourselves. The wasted effort and expense of distributing all supplies from a point five miles away through a dozen different sources must ultimately be paid for by our employes. Some of them need credit at times, particularly when first entering our employ. This can be handled much more easily and more safely by ourselves than by the merchant. Relieved of the heavy overhead expenses carried by the town merchant, and with the policy of making merely an incidental profit on the store sales, it goes without saying that we can reduce the living expenses of every family, an important item these days. We believe this will attract and help to hold the ranch worker.

Humans—Livestock

A glimpse of our new lemon curing plant—the old plant built over—would suggest that we have built as well for our employes as we have for our lemons. The day when a farmer could "get by," while building relatively better accommodations for his horses and cows and products than for his family and his hired help, has passed.



For those long hard drives on the pump—where Service is essential—where a break means a heavy loss—

"TEST SPECIAL" is the Solution

It is the best rubber belt made and especially adapted for hard outdoor usage.

We guarantee it to give better Service than any other belt used under same conditions.

WRITE TODAY, giving the R.P.M. and Diameter of the driving pulley—also driven pulley and distance between centers of same, also give the rated horse-power of your motor or engine, and name kind of machinery you are operating. We will reply immediately giving you our recommendation as to kind of Belt to use.

Alfalfa
From the Field to You

From the green fields of California's greatest ranches you can obtain your supply of the finest alfalfa. No middleman handles the product before it reaches you and not a cent of the cost is invested in anything but QUALITY. By this arrangement, prices for hay are stabilized and are always as low as they can be made, commensurate with the cost of production.

Uniform quality—never varying from the high standard set by the Alfalfa Growers of California—is guaranteed. Each grade is carefully selected and follows exactly the specifications for color and texture.

Make sure that your next order for baled alfalfa calls for the A. G. C. grades. If you cannot be readily supplied, communicate with us.

Five, Too Many! You Take This One

By L. S. Thomas

"FIVE, too many! You take this one."

Pausing in her hurried short step running to and fro long enough to kick a dog away from her youngest and to make the funny little jerky bow with which the people of her race greet a caller, she made this offer. Can you blame her? Twenty men to cook "licie" for, to say nothing of the fish to clean, clothes to wash, the big trough or tank in the bath house, or shack, to fill by means of an "armstrong" pump, the fire to keep up under said tank, as well as in, or on, her huge plank and mud "range" that had the whole blackened roof for a chimney. These few little items of daily duties, added to a garden to care for, a hundred chickens to herd out of above mentioned garden, five little Japs under five years old to care for (and they are kept amazingly clean) make the life of the Jap "tule" farmer's "picture bride" rather interesting to the student of economics.

Remember, Mr. American Farmer, that whenever you raise a crop of potatoes, onions, asparagus, celery, corn or any cultivated crop in California you are in competition with producers who have this standard of living. The same applies to the fruit business in a lesser degree.

Remember also that these children, welcomed by their parents or not, are American born and will some day be working their wives, or being worked, to fatten their purses at the expense of American ideals of the self-respecting home; also that these said purses will be opened freely to purchase land, land, the fundamental source of all life, ideal, or otherwise, at prices prohibitive to one who has been raised as the average child of American parentage is raised.

It isn't so much a question of, "Is it possible to Americanize an Oriental?" as it is, "Will he stay Americanized?" The son of a comparatively wealthy delta Japanese farmer finishes high school and speaks our language perfectly, returns to the island farm camp and in six months one can notice he begins to have difficulty with some of our words, and in five years he can hardly make himself understood.

America for Americans is fine, but American soil for American farmers and home builders is, to me, a more interesting theme. The last three years have taught us that speculation in foodstuffs is unquestionably an economic crime. This being a fact proves that speculation in the source of all foodstuffs (as well as all other necessities of life), land, is the greater crime and should be generally recognized as such. On the contrary, at present the man who picks up a piece of easy money on a real estate deal is considered a good business man, and if he continues his good work (?) long enough he becomes "one of our leading citizens."

I don't mean by this that with economic freedom as near an accomplished fact or condition as freedom in our political or religious life of today, there would be no need or opportunity for real estate dealers, for I believe in private ownership of land (thereby differing from Henry George and his followers), but I do believe there is too great a difference between the so-called market value and the productive or location value of land, and that it is altogether too easy for land to be held entirely or comparatively idle by a speculative owner when there are young child rearing couples burning the pep out of the best years of their lives in an effort to establish a real American home of the class from which we will get the generation that will settle this Oriental question for all time.

The man or woman who buys one city lot for any other reason than immediate personal use is, from an economic standpoint, as much a menace to American ideals, as I see them, as the Miller-Lux interests.

Speaking of Miller and Lux makes me think of the income tax to which they contribute so much. Just notice that they pay their percentage of their net income, which is part of their gross income derived from the productive portion of their wealth, and are allowed to pay all taxes on whatever unproductive land they hold from gross income from the productive portion, thereby lessening the net or taxable portion.

When Thomas Jefferson wrote the Declaration of Independence and with the aid of Truthful George and the other old patriots established this glorious old nation, they provided for religious, political and economic freedom. Freedom is a three phased word and we have allowed it to get lopsided. They invited the home loving, freedom hungry, pioneering people of the world to come where by the simple act of establishing a home a clear title to a generous slice of land was given, and little dreamed that in this short time away across there in the unexplored West their children would reach "the end of the trail" in a maze of concrete highways along the western edge of the world, where their children of the fourth generation would welcome their firstborn under the stigma and burden of the lease and mortgage.

Proper Methods of Stretching Furs

Every trapper needs definite and adequate information on the proper way to stretch furs. Slipshod methods often cost the trapper a great deal of money, while a careful following of the approved directions always means an increase in the value of his furs.

Perhaps the first thing you should know about stretching is which furs should be stretched fur side out and which pelt side out. The following guide is correct:

Stretch these furs fur side out: Coyote, wolf, fox, marten, fisher, lynx, lynx cat and wolverine.

Stretch these furs pelt side out: Muskrat, mink, skunk, opossum, civet, otter, ringtail cat, house cat and white weasel.

Stretch these furs as nearly square as possible: Raccoon, bear, badger and wild cat. Beaver should be stretched round.

Steel Stretchers Best

Many trappers use board stretchers of the home made variety, and these, if shaped carefully, are sure to give a moderate degree of satisfaction. Many times, too, it is impossible to get any but wood stretchers, and hence necessity often dictates their use.

But steel stretchers have easily proved themselves the most desirable of all. These stretchers are so constructed as to allow the air to circulate through the skin. Not only does this hasten the proper drying of the fur, but it also prevents molding and mildewing setting, in, which often happens when skins are stretched tightly over boards.

Steel stretchers are adjustable and can be fitted accurately to the different sizes of skins. Sharp notches on the side of the stretcher hold the pelt securely in place and assure its drying in perfect shape. Every trapper should have a good supply of these improved steel stretchers; they are light and strong and may be easily carried.

Steel stretchers do away with the danger of over stretching or under stretching. If a pelt is stretched too much the quality of the fur is damaged and its value consequently lessened. If the fur is not stretched enough before it is thoroughly dry, a good part of its value is lost, too, for very little stretching can be done after it is dry.

Stretching "Open" Furs

When skins have been taken off open, as is done in the case of raccoon, bear, badger and wild cat, the proper way to stretch them is by lacing them to a square frame. The edge of the hide is tightly sewed to the frame and the skin drawn tightly on all sides. Beaver should be stretched round and a hoop is the best thing for this purpose. The skin should be fastened to the hoop at four

squally distant points and then the slack parts taken up by sewing the skin to the hoop with a large sacking needle.

If, in stretching the cased furs, you have good stretchers and put the proper side out, you will be sure of satisfaction. It takes no longer to follow the correct directions; in fact, the proper methods add speed to your efforts. And they make your trapping profits bigger.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Married Woman in Business

Is there any way by which a married woman can engage in business independent of her husband? If so, can she convey title to real estate acquired in the course of such business and invest and control monies gained in such business as her separate property?—Subscriber, Watsonville.

A married woman may become a sole trader by the judgment of the superior court of the county in which she has resided for six months next preceding the application. In order to procure such right, she must publish notice of her intention to make application to become a sole trader in a newspaper published in the county at least once a week for four successive weeks, in which notice she must specify the date upon which application will be made, the nature and place of business proposed to be conducted and the name of her husband. Ten days prior to the date named in the notice, she must file a verified petition setting forth that the application is made to enable her to support herself or others dependent upon her giving their names and relation, the fact of insufficient support from the husband and the cause thereof, and any other ground which might be a good cause for divorce and the reason why the divorce is not sought and the nature of the business proposed to be conducted and capital invested therein, if any, and the sources from which it is derived. She may invest in the business a sum derived from the community property, or the separate property of the husband not to exceed $500. There is no limit upon the amount which she may invest from her separate property. Upon the hearing, opposition may be made whereupon the court hears the proofs and enters its decree, denying the application or authorizing applicant to carry on the business. Upon the entry of the decree, she must make and subscribe an oath to the effect that the application is not made to hinder, delay or defraud creditors of the husband, and that not more than $500 is invested from funds of the husband. Thereupon she is entitled to carry on the specified business in her own name; the property and the benefits of the business belonging exclusively to her and not being liable for any debts of the husband. In order to extend her business into another county, it is necessary for her to record a copy of the judgment and affidavit in such other county. The husband is not liable for her debts unless contracted with his written assent. She becomes liable for the maintenance of any minor children.

Pasture Bills

What is the rule governing the collection of pasturage bills, and if I desire stock taken out of the pasture, how can I compel owner to take it out? A horse was placed in my pasture when I was absent. I do not know the name of the owner. He has not returned for five months and the horse is worthless.—Subscriber, Thermal.

Liverymen as well as persons pasturing horses have a lien dependent upon possession for their compensation. If the lien holder is not paid the amount due within 20 days after it has become due, he may proceed to sell the property so as to satisfy the lien and costs of sale at public auction by giving ten day's previous notice of such sale by advertising in a newspaper published in the county in which the property is situated. Proceeds of the sale must be applied to discharge the lien, costs of keeping and selling the property, and remainder, if any, paid to the owner of the stock. Following out the procedure indicated, would probably be the safest way for you to proceed.

GREAT ACTIVITY IN SQUIRREL CONTROL

Following a recent tour of inspection throughout parts of the state, Superintendent of Rodent Control W. C. Jacobsen finds that squirrel control is progressing with unabated vigor. In Northern California where the Oregon ground squirrel is coming out in full force from its long period of hibernation, a spring poisoned grain campaign is being waged in order that maximum benefits may be derived. Field Assistant A. E. Gray has been sent to the counties of Modoc and Lassen to assist in organizing drives for the spring months.

Throughout the great valleys the carbon bisulphide warfare is being pushed to the extreme limit owing to most satisfactory condition of the ground as a result of the heavy rains which have been experienced over the state. Such a large quantity of jute balls has been used or ordered through the state department of agriculture that the supply is practically exhausted and the manufacturers of this commodity are working day and night to meet the demand. Up to the present time approximately five million balls have been ordered for use, of which three and one-half million have already been placed in squirrel burrows for the purpose of making a complete eradication in some of the large areas. No carbon bisulphide or labor shortage has existed this year as was the case last winter. The possibility for the continuance of the gas method with carbon bisulphide until late in the season will be very favorable, owing to the amount of moisture due to the late rains.

Many of the county horticultural commissioners in the state are looking forward to the best record yet obtained in squirrel eradication as a result of this opportune season.

Results show at Harvest Time

IF your seed bed is not properly prepared, take an inventory of the clods—the rough stuff in the field—and enter every single one of them in your ledger as a liability. They are just like so many pores letting out that precious subsoil moisture. You cannot spare that stored power if you want bumper crops.

International Tillage Tools put your seed bed in prime condition. In this deservedly popular line of implements are **disk harrows, spring-** and **peg-tooth** and **combination harrows, culti-packers,** etc. The disk harrow, for instance, slices and destroys the clods until the close-knit covering guards every bit of subsoil moisture, while permitting the absorption of additional supplies from above.

The 1920 International line of implements for laying crop foundation is the most complete we have ever offered. You know your soil. Whatever its needs, we have the type of disk harrow suited to it. If a sandy, loose loam the two-lever type answers every requirement; if hard, stony or trashy ground, the three-lever type with its center-depth regulator insures a firm, compact seed bed. If you use a tractor, see our leverless tractor disk. Whatever your power equipment, we have a size that utilizes it to the best advantage. Ask your dealer to point out to you the exclusive features of each type.

Let us mail you descriptive folders of these tillage implements so that you will know just a bit more about the preparing of Spring seed beds. With every implement goes an alert, responsive and intelligent service. The International dealer will serve you direct.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Lime-Sulphur for Red Spider

Please give proportions lime and sulphur for making lime and sulphur spray for red spider, etc., on citrus fruits. Also, what kind of lime is used and how many pounds of above for gallon of water?—Subscriber, Buena Park.

Probably the best procedure would be to buy the regular commercial lime-sulphur solution. Especially is this the case unless one wants it in large quantity, and even then some of our large orchardists find the labor saving ready mixture more desirable than having it prepared by the ranch labor. The container will usually give proportions to use, but for citrus trees or any tree in leaf a gallon of the lime-sulphur solution to about 33 gallons of water is the usual proportion. For the home made mixture here is the formula given in our spray special of August 9, 1919: Stone lime, 50 pounds; sulphur (sublimed or powdered), 100 pounds; water to make 50 gallons. Heat in a cooking barrel or vessel about one-third of the total volume of water required. When the water is hot add all the lime and at once add all the sulphur, which should previously have been made into a thick paste with water. After the lime is slaked another third of water should be added, preferably hot, and the cooking should be continued until a clear orange colored solution is obtained (usually 45 to 60 minutes), when the remainder of the water should be added, either hot or cold, as is most convenient. The boiling due to the slaking of the lime thoroughly mixes the ingredients at the start, but subsequent stirring is necessary if the wash is cooked by direct heat in a kettle. After the wash has been prepared it must be allowed to settle and then be strained through a fine sieve as it is being run into the spray tank. The resultant product is a concentrated solution of lime-sulphur, which should be diluted about six times with water for winter spray. If dry lime-sulphur or "dust spray" is preferred, use three-fourths sulphur and one-fourth hydrated lime.

Apple Stock

Will young apple trees grown from seeds of Newtown Pippin and Bellefleur make good root stock for nursery? If not, why? What seeds are best for nursery stock?—X. Y. Z., Watsonville.

Seedlings of any sort do not give absolute assurance, though much used. Those most particular have secured real Northern Spy wood, but seedlings of the same should also be somewhat resistant to woolly aphis—the chief reason why this particular variety is used. In fact, it is not essential to any orchard to use aphis resistant stock. We see no reason why your seedlings will not qualify, but would throw out the weakly and use only the strongest and most vigorous.

Testing Automobile Cylinder Oil

Where can I get automobile oil tested as to viscosity and flash test?—Subscriber, Porterville.

This calls for expert with proper equipment. The chemists of Los Angeles and San Francisco are fitted for such work and it is possible Tulare County may have such experts. Of course all oil companies are fitted to make the test.

Dressing for Wounds

Is pine tar injurious to fruit trees—that is, in pruning trees and cutting out large limbs and painting over the wound with pine tar?—Subscriber, Hoaglin.

Bailey's "Pruning Book" says: "Paint and tar are the dressings most universally recommended. Tar and coal tar are popular with foresters, but it is certain that they often injure the cambium and bark of fruit trees. Dressings of tar, and even bandages of tarred paper, made to protect plants from borers, often destroy the bark, particularly on young trees." Again, warning is given in applying tar to cherries, peaches and plums. From this we take it that if the application is carefully made to the cut portion only it will be beneficial, but if applied in large quantity so that it runs down over the bark, especially with the trees mentioned, they will be injured.

Spray for Worms in Apples

What is a good spray for apple trees? Last year the fruit was very wormy.—Subscriber, Anaheim.

Spray when trees are finishing blooming, again in ten days to two weeks, and at other intervals two or three weeks apart with neutral lead arsenate paste, 5 to 10 pounds; water, 100 gallons; or, if dry or powdered lead arsenate is used, use half the quantity.

Killing Bermuda Grass

Please tell us how to kill out several small patches of Bermuda grass we have found on our place. Soil is sandy.—Subscriber, Orosi.

The best treatment of Bermuda grass is a chisel toothed cultivator with tractor or good stout team. Cultivate, cross cultivate, then cultivate some more, and continue it, if not weekly, at least often, and it will wipe out the worst Bermuda pest we have ever seen. There is no satisfactory chemical remedy within economical bounds.

ESSEX MOTORS DETROIT USA

Tests That Proved Hudson Also Speak for Essex

And Essex Holds World's 50-Hour Endurance Record

Built by the same makers, Hudson's unequalled records also speak for Essex. They foretold performance never expected of a light car.

The prophecies now are facts.

An Essex stock chassis set the world's 50-hour endurance mark of 3037 miles. That is officially certified by the American Automobile Association. And Essex holds the world mark of 1061 road miles in 24 hours. A stock touring car did that.

Local road, speedway and hill-climbing records in every section of the country are held by Essex. Scores of abusive tests have proved the endurance that 30,000 owners find in the daily service of their Essex cars.

Judge Essex Quality By the Hudson Standard

But it is not only in performance that Essex shows the same stamp of quality as Hudson. Its beauty of line, its luxury of appointment are the work of years of leadership in coach design.

See the care and completeness, even in the smallest details. Its riding comfort, its smooth, quiet running ease, with the suggestion of well-contained reserve power, are qualities comparable to the finest of high-priced cars, yet you gain all the advantages of the light weight type, more important today than ever.

Judge the Essex, not by the lightweight standards that you have known, but by the much more exacting requirements of the large, costly cars. Measure it by the highest standard of performance and fine quality, rather than by its moderate price.

You, too, will find the appeal that has won 30,000.

In all Hudson's unmatched records this important fact is clear—No ability is sacrificed in one direction to gain supremacy in another.

Hudson Records Prove Its All-Round Mastery

Hudson is the fleetest. Its stock car speed records have never been equalled. On the speedway its racing cars won more points than any other team ever gained.

But its speed means no forfeit of other qualities. For in official tests, the Super-Six has also out-performed all other types, in endurance, hill-climbing and acceleration. In every motor performance it has established leadership by unanswerable proofs.

Only a supreme advantage, that others cannot use, could account for such all-round dominance. Hudson has it in the Super-Six motor. It minimizes vibration to within 10% of vanishing—nearer the ideal than any type we know.

In the same size motor the exclusive Super-Six principle added 72% to power, and 80% to efficiency. Endurance is practically doubled.

Hudson Motor Car Company, Detroit, Michigan

HUDSON SUPER SIX

SETTLEMENT OF IMPERIAL

(Continued from Page 658.)

workshops, schools and social centers will all be a part of its activities. A telephone service will be a time and money saver and should be a part of the scheme. Plans for towns and for community needs ought not be left to blind chance or to real estate agents. Here is an opportunity for California to show the nation what art, science and trained minds can do to enhance the comfort, convenience and beauty of country life. Our rural progress, in this direction, has not kept pace with the rest of the world. When Australia made ready to settle 350,000 acres of land along the Murrumbidgee River, it sent to America for a city planner to locate and design the future cities and towns of that area. That settlement is being built on an up to date foundation. The public land of the Imperial Valley gives an opening for us to assume a leadership.

5. Fixing the Price of Farms

To sell good land and poor land at one price is bad business and is unfair. If there is to be equality of opportunity, the prices of the farms must be based on their location and character. Only in that way can they be all made equally attractive. The prices of the farms at Durham were so fixed and as a result they varied from $48 to $235 an acre, yet when the applications were all in, every farm was the first choice of some settler. If they had all been sold at the same price and no attempt made to have the price correspond to value, the best farms would have been over-applied for and the culls would have been left.

6. Plans for Houses

The Imperial Valley has a long hot summer. The farm homes ought to be planned to suit and mitigate the

climato. This area ought to have an architecture of its own just as does India in the tropics, or Sweden in the wintry north. The plans should include advice about trees to secure shade and the kind of roofs that will help keep the house cool. Every house ought to have a bath and be protected against mosquitoes. These are things that ought to be thought out in advance of settlement. The comfort, convenience and attractiveness of the homes at the state settlement in Durham show what great benefits can be wrought in this larger area.

7. Choosing Settlers

In the cultivation of the land in California, alien tenantry has become a grave social question. There are too many non-resident owners and too many tenants in the Imperial Valley. Both should be kept out of this extension. It should be a home of small farms cultivated by their owners. It should be a mecca for the aspiring farm laborers who want to live in their own home and have their own fruit trees. These settlers should all be citizens. They should be men who take farms not to sell at a profit, but to live on and improve; men who like rural life, who have training or aptitude to succeed. It will be a waste of land, an injury to the district and unjust to worthy settlers to take anyone but those to whom this will be a real opportunity, because if this district is developed along the lines indicated, there will be far more applicants for farms or farm workers' homes than the land will provide. Those who seek to come here will be numbered not by thousands but by tens of thousands.

Before the 50 farms at Delhi were thrown open to settlement on the 23rd of last month, 6,000 people had asked to be notified of the opening or had applied for farms. They came from all states in the Union. I have read hundreds of these letters. Many are tenant farmers in the Middle West. They write that land prices have become so high that they cannot hope to buy and pay for farms there. Settlers from the rich states of the Mississippi Valley write that they want to get away from districts where more than half of the land is farmed by dissatisfied tenants and where owners will make no improvements. They want a home in a farm settlement like those at Delhi and Durham where every man owns his home, where there is cooperation and a friendly neighborhood life.

8. Financing Settlers

The financial aid which the state gives settlers at Delhi and Durham ought to be given to these settlers. Under the state land settlement act any settler can borrow up to $3,000 for the improvement and equipment of his farm. If he borrows to build houses, barns or level land, the payment can extend over 20 years at five per cent interest. If he buys cows and implements, he can get five years' time to repay.

In addition, the plans should include advice and direction for settlers after they go on the land. The settler should be aided by expert advice to form cooperative associations and in deciding what crops to grow and when to plant them. It would not be an aggregation of individual farms, each owner looking out for himself and making his struggle alone. It would be organized communities of convenient size, whose members would cooperate in buying and selling, who would have a social center and a neighborhood life, helping each other in many ways and gaining strength and courage by touching elbows together.

This league can render no greater service to the section it seeks to conserve and develop than to create at this meeting a committee to work for a planned development of these lands and the proper financing and helping of settlers.

9. Soldier Settlement

Thus far I have said nothing about making this a soldier settlement. I believe that for ex-service men who like rural life and have an aptitude for farming, it presents alluring opportunities. I have protested against the selling of this land to speculators and urge that it be used to create homes for landless men and especially for landless soldiers. I have appeared before a congressional committee to advocate this and believe that the action taken by congress was influenced largely by the belief that ex-service men would be given a preference in the settlement of this land.

This discussion has dealt with the needs of rural civilization and of landless poor men. Whatever will help the civilian will help the ex-service man. Our soldiers represented the picked youth of this country. They had the strength, health and courage and a great many came back from the war stronger and better fit than they left. They are therefore better equipped to succeed than many who tried to enlist and were rejected. If the opportunities of soil and climate in this region are joined to the social and economic opportunities of the state land settlement act, which have brought such striking results at Durham, a soldier settlement here would be an ideal foundation for an agriculture and a patriotism worthy the efforts of this league and of enduring benefit to the whole country.

Deep Tillage of Loams

The indiscriminate breaking of the subsoil of loam ground is not always profitable, though never likely to be damaging, as the subsoiling of sandy ground may be. Owners of loam will do well to study the characteristics of their own particular land rather than confine their attention to any particular implement or process.

Loams vary in fineness of texture. The coarse types always are open and loose down deep unless they have been abused. The fine types, however, often become puddled under a small amount of bad treatment. Both types may have plow sole, both may be tramped by pasturing stock, particularly in a corner of a field where the animals spend much time: and both may be badly compacted where a road or path crosses.

Where loam is well filled with organic matter and has had a proper rotation of crops it is not likely that it will be improved by blasting. When compacting of any kind, at any depth, has occurred, blasting is the best way to begin the restoring of natural, productive conditions. Those who have had experience in trying to get a road again under cultivation will best appreciate what a great help it is to thoroughly loosen the ground with explosives. Every time the ground is loosened deeply crops should be grown to fill it with roots and other organic matter to keep the loose soil from puddling.

There is a widespread condition prevailing throughout loam sections which must be mentioned here, that of mixed strata of loam and clay or other soil. Unfortunately for calculations the pure loam seldom extends down below root depth. The result is that many soils classed as loam have a subsoil demanding blasting just as much as out and out hardpans and stiff clays. The soil auger should be used in every piece of ground. A hole per acre is not too much to put down to learn the underlying conditions. If a layer of soil is encountered that roots may have difficulty in penetrating, that will not let water through freely, or in which plant food may not be available, in short, if it is not properly granular, it should be blasted almost without regard to the loam above or below it.

In blasting the aim should be to break to the surface without throwing out a crater and if possible to break through the tighter layers to something open and porous beneath, such as gravel or sand. When the depth to such a loose layer is more than six feet, however, and in some cases only four to five feet, it does not pay to break entirely through. The charges then should be placed 2½ to 3½ feet down, and if properly loaded they will loosen and fine all the soil above, which will make sufficient root pasturage if well developed by cover crops and other agents of fertility.

Alfalfa Weevil Checked

The alfalfa weevil in some sections not only causes financial loss but even threatens actual ruin. Heretofore the control methods were only partially successful. Flooding the alfalfa fields, cultivating them when dry, and dragging them with a brush harrow, seemed to check this pest only in a measure. Also, the growth of a second cutting was so delayed and often so short that the crop as a whole was much reduced.

Work by the Salt Lake City office of the bureau of entomology, United States department of agriculture, showed that best results came from spraying the alfalfa fields with a solution of arsenate of lead when the larvae of the weevil were doing the greatest amount of damage on the first crop. Demonstrations were held in various sections of the great Salt Lake Valley in cooperation with the county agricultural agents. During 1919 this work was extended and the demonstrations carried forward by the county agents indicate that an effective and cheap method of stopping the destructiveness of this pest has been found.

During the past year 4,263 acres of alfalfa were treated by spraying, and it is estimated that the net saving on these demonstration fields totals $41,371. By this method the first crop of hay is saved. The cost is only about $1.50 an acre, as but two pounds of arsenate of lead are mixed with 100 gallons of water and applied at this rate to an acre of alfalfa. Power pumps which force the spray through extension nozzles make it possible to apply a fine, driving spray over a wide strip quickly and effectively.

The demonstrations proved a considerable increase in the production of hay to the acre. This sometimes amounted to from 1,500 to 2,000 pounds. In Sevier County, Utah, demonstrations conducted on 1,700 acres showed an average increase of 800 pounds an acre. At the prevailing price of alfalfa hay, $20 a ton, the resulting saving should total $13,600 in that county alone.

CLEARING LAND BY BURNING

Considerable misunderstanding exists in California as to a landowner's right to use fire for clearing land of "slash," brush or other material. To correct any misunderstanding and to direct attention to the necessity of preventing and suppressing uncontrolled fires, the state board of forestry gives out the following information with a plan for the use of controlled fires.

Both state and federal laws permit the use of controlled fire, either for the disposal of "slash" within the timber belt or for clearing land outside the timber belt. There is no law against a man or a group of men setting fires on their own lands, providing the fires are kept under control. The unlawful act (so recognizezd by state and federal laws) comes when uncontrolled fires are allowed to spread to the lands of others. Such fires are a menace to the entire community and often entail great expense to combat.

As a result of the misunderstanding that has existed it is possible that some men, fearing to use fire openly for clearing their land, have resorted to a "touch the match in secret" policy and then have left the scene permitting the fire to run at random.

Protective organizations should be formed by landowners for the purpose of protecting their improvements, ranges and crops from uncontrolled fires. With the same organization landowners can get together and use controlled fires to clear land. This can be done lawfully and without great risk if proper precautions are taken.

When a member of a fire protective organization finds it advisable to use fire for clearing land, or for any other legitimate reasons, he should notify the other members of the organization and request them to come to his aid. Fire lines should be prepared and when the wind is right fires should be set inside the fire lines around the entire area to be burned. Nobody should attempt burning unless enough men are present to properly patrol the fire lines.

Some counties have adopted ordinances requiring that permits to burn brush or other material must be secured from the county fire warden. In these counties the county law must, of course, be complied with. The state, however, does not require a permit for a man to burn on his own property.

By following out the above plan farmers can lawfully make fire their servant at the season of the year when it will do them the most good. It is not "light burning" that th

farmer or the stockman wants. They want honest-to-goodness hot fires that will rid their land of brush or other undesirable material. Such fires are extremely dangerous unless properly safeguarded, and for this reason a man, wishing to burn, should notify his neighbors of his intention so that they may be present to lend a hand if necessary. Every precaution should be taken during the coming summer months to prevent and suppress uncontrolled fires.

While land owners may legally use fire to clear their lands they should take every precaution to keep these fires under control, bearing in mind the fact that they will be held legally responsible should the fire escape

BEES ON THE FARM

California fruit growers well know the value of bees in the orchards. In olden times it was urged that bees injured fruit, but we now know that bees have no organs or other means for piercing skins of fruits and so do not work on any unless it has been first mechanically injured or the skin broken by sun, wind or rain. That bees are highly beneficial in assisting pollination of all fruits is equally well known.

The ravages of bee diseases a few years ago led to discouragement of ownership by farmers, but these diseases are now under official inspection and easy of control and no longer prove a menace to the farm apiary as a side line. California leads the states in production of honey, our mild winters exact but a minimum of care, risk of loss through cold is eliminated and natural food supply usually good. As the monetary returns have been satisfactory for many years past there seems no good reason why every farm should not produce at least sufficient honey for family needs. Aside from good books and farm journal treatises on beekeeping the United States department of agriculture supplies a number of bulletins on beekeeping which may be secured free by writing for them. They are Farmers Bulletins: 442, Treatment of Bee Diseases; 447, Bees; 503, Comb Honey; 653, Honey and Its Uses in the Home; 695, Outdoor Wintering of Bees; 820, Sweet Clover: Utilization; 961, Transferring of Bees to Modern Hives; 975, Control of European Foul Brood; 1012, The Preparation of Bees for Outdoor Wintering.

FARM LABORER, RENTER, OWNER

If California young men desire to become the owners of California ranches when their elders get through with them, they will usually find it necessary to begin as workmen, then renters, and in due time owners. This is the normal, natural process of attaining land ownership. If the present owners of ranches are ambitious to be succeeded by their sons and neighbors sons as owners, conditions both of remuneration and environment must be made attractive to this type of citizen. Since our city populations are largely augmented by the drift of young men and women from the country to the city, our cities have a vital, selfish interest in the type of citizenship on our ranches, for as the country is peopled today, the cities will be peopled tomorrow.—Dean Van Norman.

REGARDING STRIKES

"The statement has been made so often that organized workers have an inherent right to strike when and wherever they please, that the public has accepted the statement as being true. Recent events and happenings however, indicate that the country generally is giving this question serious consideration and, as a result, there is a demand that some other method be employed to bring about the settlement of controversies between employer and employe. This demand is more pronounced on the part of the farmers of the United states than of many other classes for the reason that they are affected more directly than most other classes.

"No great city could be built up if it were not for the fact that those who live in them may depend, first, on the farmers of the country to produce an ample supply of food for all, and, second, on the railroads or other transportation facilities to function properly at all times and deliver farm products to city consumers with regularity and as needed.

"It naturally follows that those who believe that labor has an inherent right to organize a strike, believe that such organizations have a right to starve the people of the cities to death, on the one hand, and to destroy the property of the farmers on the other. No such right has ever existed and no such right exists now. No set of men has ever had the moral or legal right to destroy property or cause suffering by conspiring together and the welfare of all the people must ever remain superior to that of any class or group of people.

"What would be the verdict of the people if the farmers should suddenly decide to go on a strike? They would be condemned from one end of the country to the other and the fact would be pointed out that they, as the owners and tillers of the land, had no right, either moral or legal to bring about such a calamity.

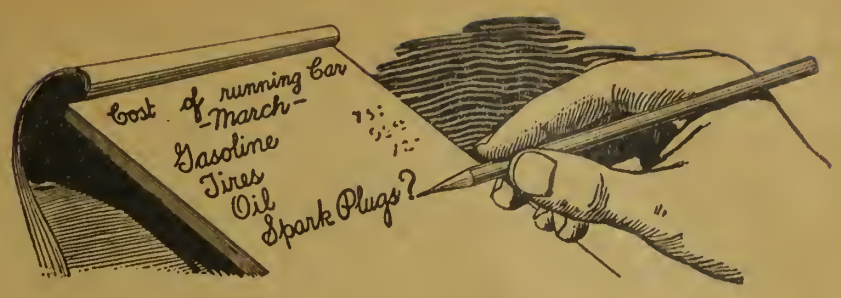
"The farmers must look to Congress to solve this great question in the light of fairness for all and not for the benefit of the few, at the expense and perhaps misery and suffering for all." —Resolutions of farm organization delegates in convention assembled in Washington.

PAINTED LADY BUTTERFLY

Fred M. Reed of Riverside writes:

"An interesting item just now is a remarkable flight of the "Painted Lady" butterfly (Pyrameis cardui), which since yesterday are in the air in countless numbers. As their chief food plants are said to be composites of the thistle tribe no especial harm is expected, unless the young caterpillars should take to more valuable crops if their regular food supply should fall short."

If the fruit grower takes care of his orchard, his orchard will take care of him.



Are spark plugs an item of YOUR car up-keep?

VEXATIOUS delays, due to bad spark plugs, cost you more than the price of the plugs. Whether on the road or in the field, whether it be a truck, car, tractor or stationary engine, each delay adds to your operating costs.

The Splitdorf Spark Plug—"The Plug with the Green Jacket"—is break-proof as well as leak-proof. It insures you against delays due to the breakage of inferior plugs.

East India Ruby Mica exclusively is used for the insulation of Splitdorf Green Jacket Spark Plugs. It never chips, breaks or cracks—there's no porcelain to break to put your plug out of commission. Splitdorf Green Jacket Spark Plugs cost no more than porcelain plugs—once installed you say "Good-bye" to spark plug troubles. And Splitdorf Green Jacket Spark Plugs are absolutely guaranteed against breakage.

Send for booklet showing the correct plug for your engine. There is a type of Splitdorf Green Jacket Spark Plug best suited for *your* engine.

28 Registered Holsteins

L. B. Van Blaricon Herd

El Monte, Cal.
Saturday,
May 8, 1920

This is one of the best small herds in Southern California.

The owner has milked and handled the herd himself for the past six years, and under ordinary herd conditions has developed a large percentage of his milking females to official records up to over 26 pounds butter in 7 days.

The herd has been regularly tuberculin tested and no reactors have been found for over three years. The cattle will be sold under certificates from a Deputy State Veterinarian.

This is also a highly bred offering, details of which will appear in later announcements.

If you want to buy from one of the cleanest herds of its size in the state don't miss this sale.

Catalog free on request.

Infectious Abortion in Sows

By Fred M. Hayes and Jacob Traum of the Division of Veterinary Science, University of California

REPORTS from the Middle West and from some sections of California indicate that infectious abortion in sows is becoming of considerable importance. This disease is already widespread among cattle, particularly dairy cattle. Its extension to sows calls for additional vigilance to prevent greater loss and if possible to confine the disease within the limits in which it has lately been recognized. Within the past three months three outbreaks of considerable size have been investigated in California. Answers to a questionnaire recently sent out to swine raisers show that the disease is perhaps more prevalent than is generally recognized, but not alarmingly so.

Cause

Results of investigations thus far carried out by the division of veterinary science of this station in the three herds referred to have indicated that the abortions were due to an infection with a germ indistinguishable from the abortion bacillus of cattle. Pure cultures of this organism have been obtained from the afterbirth, vaginal discharges, and the organs and body fluids of the immature fetuses. Since abortion in cattle is so widespread it is assumed that the source of the infection in swine is probably infected cattle. In cattle this disease is indicated not only by abortion of the fetus, but also by retained afterbirth, barrenness, inflammation of the womb and ovaries. The infection in sows probably enters the system through the digestive tract mainly, as in cattle, but the boar through service may be a factor. The relative importance of these channels of infection is yet to be determined.

Symptoms and Diagnosis

The symptoms thus far recognized do not vary greatly from those observed at the normal farrowing time. In a few cases a slight greyish discharge has been noticed just prior to the abortion. Abortions may occur at any period of pregnancy. Those occurring early result in the expelling of the litter without visible effort. More labor is required the nearer the end of gestation period that the abortion occurs. There is some evidence at the present time to indicate that what appears to be a normal birth of a litter in an infected herd may be one accompanied by infection with the abortion bacillus. This is particularly true where all or some of the pigs are dropped underdeveloped, weak or dead. Some sows show a greyish discharge from the genital organs for several days after the abnormal farrowing. The afterbirth also shows an accumulation of this material on the surface that has attached it to the mother's womb. From the appearances of the sow or the farrowing act, it is difficult, if not impossible, to determine whether or not the sow and pigs are infected. Occasional abortions are claimed to result from undue exposure, accident, spoiled food, and deficient food elements. Diseases like hog cholera, swine plague, etc., are known to cause abortion, but infectious abortion should be suspected in all cases where, prior to the act of abortion, the sow shows no evidence of disease. The most practical means of determining whether or not this infection exists in a herd is either to isolate the germ from the fresh afterbirth or fetus or perform the agglutination test on the blood serum of suspected sows. The division of veterinary science is willing to perform the agglutination test on the blood of sows if the swine raisers will have the blood collected and sent to the laboratory.

What the Test Means

Reaction to the agglutination test for infectious abortion indicates that the animal is infected with the disease or has been infected at some previous time. It is not an indication, however, as to whether or not a sow will abort. The reaction of a number of animals in a herd shows the presence of active abortion infection in the herd.

These interpretations are based upon experience with infectious abortion in cattle. The limited work done at this station or reported from elsewhere on this disease in hogs, does not warrant any more definite interpretation. Should future observations of this station or reports from other stations permit different interpretations, such information will be contained in the letter reporting results of the test.

Drawing and Shipping the Blood

The most convenient place to draw the blood for the test is from the marginal vein of the ear. The vein lies on top of the ear and from one-half to one inch from the outer edge. The skin over this region should be thoroughly cleansed. Rubbing the ear and squeezing it near the base will distend the vein and make it more visible. The vein may be incised with a sterilized knife or razor blade and the blood allowed to drop into a clean, dry and preferably sterile bottle. About one tablespoon of blood is sufficient. A few minutes after the blood has clotted the bottle should be shaken to separate the clot from the sides. The knife should be sterilized by boiling before use and also cleaned before using on another sow.

It is difficult to draw blood from the ears of some sows. In such cases the blood may be drawn from the tail. After thoroughly cleansing a small piece may be clipped off, or an incision of about one-quarter inch may be made crosswise on the underside of the tail at about two or three inches from the root and the blood allowed to flow into the bottle. The blood flow from the tail can be stopped by tying a string around it and painting the cut area with tincture of iodine. Samples may be shipped by express, or by parcel post to Division of Veterinary Science, University Farm, Davis, California.

Treatment and Prevention

We have no information at the present time that drugs or vaccines are of any value in c ntrolling abortion in sows. Drugs have proved of no value in controlling this disease in cattle, and vaccines are only in an experimental stage. Our efforts, therefore, should be directed toward the prevention of the disease and, in the light of our present knowledge, should consist in observing the following precautions.

Where infectious abortion in swine does not exist: Keep sows away from cattle and new born calves. Pasteurize all milk fed to hogs. Milk may be pasteurized by heating to 145 degrees Fahrenheit, holding it at that temperature for one-half hour, and cooling immediately.

Newly purchased sows, especially if they are settled in pig, should be kept isolated until farrowing unless there is a clean history of no such infection in the herd from which they came.

Sows shipped away to be bred should be kept separate from the balance of the herd into which they go and also be isolated upon return home unless there is a clean record of no abortions in the herds.

Where infectious abortion in swine does exist:

Remove the healthy sows to non-infected pens or pastures, if abortions occur in any group. The sow that has aborted or reacted to the agglutination test, and the aborted fetuses and afterbirths are centers of infection from which the disease may be controlled to prevent the spread of the infection

Remove and destroy by burning or burying the aborted fetuses and afterbirths so that other sows will not come in contact with them.

Keep the aborters closely confined until all evidences of a discharge have ceased. The discharge after apparently stopping may begin again. It is therefore advisable to be cautious about releasing suspected sows from quarantine.

Before turning out an aborter, or even a sow that has farrowed normally in an infected herd, she should be sprayed or scrubbed with a disinfectant solution. Particular attention should be directed to disinfecting the region around the external genital organs. Clean and disinfect the pens frequently and especially after they have been occupied by a farrowing sow.

Sows that appear healthy but have reacted to the agglutination test should be carefully watched and handled as expected aborters. Even if a reacting sow farrows a normal litter she should be treated as an aborter because experience with cattle show that in such reactors a normal birth may be accompanied by infection.

Southern California Breeders Spring Sale

100 REGISTERED HOLSTEINS

Rhoades and Rhoades Sale Pavilion
CLEARWATER, CAL.

Tuesday and Wednesday, April 27-28

An offering of registered Holsteins of high merit, including many of the best bred things ever sold in Southern California; wonderful producing cows with both short and long time records; cows that have milked over 100 lbs. in one day; cows that are now milking from 60 to over 90 lbs. per day; daughters of great producing dams by highly bred sires; cows and heifers in calf to some of the best bulls in the state; and an offering of bulls that contains real herd bulls and young sires that should improve any high class dairy herd.

Some Females to be Sold:

A GRANDDAUGHTER of both the former world's record cows Aralia De Kol and Riverside Sadie De Kol Burke. Her three nearest dams average 1060.7 lbs. butter and 2626.5 lbs. milk in one year.

DURMELIA 2ND, First Prize cow at Riverside Fair. Now on yearly test and has made over 12,000 lbs. milk in first 4½ months. She is bred to the sensational young sire Sir Veeman Korndyke Pontiac .

TEN DAUGHTERS OF ARALIA DE KOL PONTIAC SALAMBO, whose three nearest dams average 1032.17 lbs. butter and 24158.2 lbs. milk in one year. Some of the strongest long time production backing to be found.

SEVERAL GRANDDAUGHTERS OF PONTIAC CLOTHILDE DE KOL 2ND, the first cow to make over 1200 lbs. butter in one year or over 37 lbs. in 7 days.

SEVERAL GRANDDAUGHTERS OF TILLY ALCARTRA, bred to bulls of outstanding quality.

SOME CHOICE COWS AND HEIFERS bred to King Winnie, whose dam was the first cow in California to make over 1200 lbs. butter in one year.

TWO DAUGHTERS OF SIR VEEMAN KORNDYKE PONTIAC, whose first daughters to freshen are placing him among the very top bulls yet developed in the west.

MANY COWS WITH OFFICIAL RECORDS up to over 25 pounds butter in 7 days; cows from dams with over 30 lbs. butter in 7 days; cows and heifers by yearly record sires and out of high record dams.

Some of the Bulls to be Sold:

KING PAUL KORNDYKE VALE, who sells only because Mr. Millard is making an absolute dispersal sale. He is by King Korndyke Sadie Vale out of a 31 lb. daughter of Sir Sadie Cornucopia. He is a big bull and sires big framed, stralght calves. His dam and sire's dam both weighed over a ton each and he is transmitting their great size. You don't have to look beyond this fellow for a real herd sire.

A SON OF KING PAUL KORNDYKE VALE out of a 21 lb. 3 year old whose three nearest dams average 1,060.7 lbs. butter from 26,264.5 lbs. milk in one year. The dam is granddaughter of Riverside Sadie De Kol Burke and Aralia De Kol, both former world's record cows.

SEVERAL YOUNG SONS of Aralia De Kol Pontiac Salambo, whose three nearest dams average 1,032.17 lbs. butter and 24,158.2 lbs., milk in one year.

A SON OF KING PONTIAC NETHERLAND SEGIS 3D, whose daughters are making splendid production records, out of a great 28 lb. cow that has a 25 lb. 3 year old daughter and a 17 lb. junior 2 year old daughter.

CHOICE YOUNG SONS of AAGGIE DE KOL COLANTHA, and of TOYON FAYNE VALDESSA, two royally bred herd sires.

Contributors to Sale:

W. D. MILLARD, Arcadia
(Complete dispersal)
P. H. KRICK, Anaheim
BOST & JOHNSTONE, Compton
STALDER BROS., Riverside
AGEE BROS., Rivera
CHAS. S. HARRINGTON, Corona
W. T. McALISTER, Los Angeles.

Sacramento, Calif.

Cleaning and disinfecting must be thorough and the disinfectant of sufficient strength. A good disinfectant can be prepared from one pint of compound solution of cresol to four gallons of water; or from one pint of a dip of uniform composition and the same amount of water.

NAVEL OR JOINT ILL CAN BE PREVENTED

"In the spring, at foaling time, great care should be taken to prevent 'navel ill' or 'joint ill' in colts," is the advise of Dr. W. R. Kidwell, assistant professor of veterinary science in the University of Idaho. "This is an acute infectious disease that occurs within the first month. It is characterized by a swelling of the leg joints which usually appears a few days after birth. The swellings are hot and painful and often rupture and discharge pus. Any movement of the legs is made with difficulty and the animal appears lame. The disease frequently results in chronic inflammation of the joints and permanent enlargement of the joints. In some instances the joints are unaffected, but the navel swells and becomes hot and painful and sometimes even discharges pus. Abscesses occasionally are formed in the internal organs. With either kind of infection the animal refuses to suck, is depressed and lies down most of the time.

"If the bowels are affected the animal will have abdominal pains. When lifted to its feet it is rarely able to stand; the temperature is high, around 105 degrees Fahrenheit and breathing is difficult. The death rate is high, running as much as 90 per cent in some cases, and if the animals recover they are usually stunted and fail to do well for some months.

"The treatment of this disease is not very satisfactory—the best treatment being prevention. Proper care should be given the colt at birth such as painting the navel with tincture of iodine and then dusting with an antiseptic powder. The stall where the mare is kept before foaling should be clean and should be thoroughly disinfected with creolin or some satisfactory dip, then bedded with clean straw and that sprinkled with disinfectant. In light attacks painting the swelling with tincture of iodine and providing clean, dry quarters are of help. Severe cases require the attention of a veterinarian."

MORE GOOD HORSES NEEDED

The thing most needed in the production of work horses for American farms is greater care in the selection of the stallion and the brood mare, say animal husbandry experts of the United States department of agriculture who have been studying the present situation with respect to horses. Not only was there a net decrease of approximately 373,000 in the number of horses on farms on January 1, compared with a year ago, but the experts are of the opinion that there has been an even more marked decrease in the number of mares bred during 1919. The extent of this decrease can not be accurately determined until the colt crop of 1920 is estimated. However, if the decline in breeding is as great as conditions now indicate, the country will be confronted with a seriously depleted supply of good horses within the next few years.

Many farmers are using up their work stock without making any provision for the future. Such a policy is short sighted and will have serious results, according to department of agriculture representatives. The present need is to increase the percentage of efficient horses by the careful selection of parents. One of the principal factors from which the market is suffering is the breeding of too many low grade work animals. There is a strong demand for high class horses, at good prices, the department says.

SWINE FIGURES

The United States department of agriculture estimated that we had on farms: 70,978,000 head of hogs January 1, 1918; 74,584,000 head of hogs January 1, 1919, 72,909,000 head of hogs January 1, 1920.

This shows a decrease of slightly over two per cent in the total number of hogs during the calendar year 1919. However with that decrease there has been an increase in the number of hogs registered by the various swine record associations during the same period. In the year 1918 there were approximately 315,000 head of hogs recorded by all the associations as compared with 424,000 recorded in the past calendar year. This shows an increase of almost 35 per cent in the number of registrations. With it there should be a somewhat comparable improvement of the quality of our swine.

It is interesting to note that since the beginning of the practice of recording pure bred hogs in this country there have been approximately 3,500,000 head of hogs recorded during the period of about 45 years during which associations have been keeping the records. A large percentage of the total number of hogs which we now have carry some of the blood of the hogs of the various breeds; many of the hogs are pure breds but have never been kept recorded; and too large a number of our hogs today show no good breeding from any of the pure breeds. There is still an abundance of room for improving our swine.

The Fifth Annual National Swine Show will be held on the Iowa state fair grounds, Des Moines, Iowa, October 4 to 8. With a few exceptions, the classification will be identical with that of previous years and will include $2,000 classification for each, the Berkshire, Chester White, Duroc-Jersey, Hampshire, Poland China and Spotted Poland China breeds, and $1,000 classification for each, Large Yorkshires and Tamworths. The Duroc-ersey futurity will carry a $2,000 classification this year instead of $1,000 as has been the custom in the past.

IMPORTANCE OF CAN DRYING AFTER STERILIZING

Clean, sterile, dry cans for milk and cream are constantly becoming of greater financial importance to the milk plants, creameries, cheese factories and ice cream factories of the state. It has been estimated that a saving of from $200 to $5000 per year in each plant, depending on output, could be effected by proper can drying. Loss not only results from the short life of the cans but the quality of the product is also affected.

The application of live steam for a given length of time to the inside of a can kills most of the bacteria and molds. However, to be effective this must be followed by hot, dry sterilized air, which prolongs the sterilization, aids in the destruction of sport forming bacteria, and thoroughly dries the can. Rust and oxidizing influences, so destructive to containers, are checked by this drying.

After sterilizing a can by live steam, condensation from the steam remaining in the can takes place, and unless removed by artificial drying this moisture affords an excellent breeding ground for bacteria.

Cans sterilized and dried may be covered immediately and shipped long distances or held for indefinite periods and retain their sweetness. This not only results in saving the life of the can but insures further improvement in the quality of the product and minimizezs danger of metallic taste or oxidation.

WHICH ONE?

There was a man in our town and he was wondrous wise, he didn't buy his tractor until he'd used his eyes. He watched a lot of tractors work upon the neighboring farms and noted their advantages, their weaknesses, and charms. He saw that while they all were good, that one was far the best, and at its work, in field or belt, it far outshone the rest.

San Diego County has a new farm adviser, J. G. France succeeding Mr. Weinland.

Sensational ? Yes!!!

An offering of registered Holsteins equal to the W. J. Higdon herd would be a real sensation in any Holstein community in the world, for few men in their entire lifetime succeed in gathering and developing a herd of equal merit. Selection of the foundation animals for this superb herd was made with extraordinary judgment, as later events fully proved, and the development of these cattle has written one of the bright pages in the history of constructive work for the breed. With the exception of the young daughters of that wonderful young sire KING KORNDYKE PONTIAC 20TH, the entire herd will be sold to the highest bidder at

Tulare Sale Pavilion, Tulare, Cal.

WEDNESDAY, MAY 5, 1920

55 Registered Holstein Females and Bulls

Just for a moment follow this list of some of the females to be offered, most of which are bred to King Korndyke Pontiac 20th, and then weigh their tremendous value as breeding and producing animals:

HOLLYWOOD LILITH PONTIAC, 36.20 lbs. butter in 7 days as a senior 3 year old, California record in class. She has a sister by the same sire with over 38 lbs. butter in 7 days, another has just made over 35 lbs., and another now on test promises to make over 37 lbs.
COLOMBA BEAUTY BUTTER MAID, 34.71 lbs. butter in 7 days at 4 yrs. 2 mo. She also made 875.33 lbs. butter from 20,202.7 lbs. milk in one year freshening at 3 yrs. 12 days. She was selected to go to the St. Paul Sale before Mr. Higdon decided to sell his herd.
THELMA HARTOG DE KOL, 31.13 lbs. butter in 7 days, and well along with calf to a son of Mutual Fobes Longfield De Kol.
MONA FOBES, 30.11 lbs. butter in 7 days, a daughter of Mutual Fobes Longfield De Kol and one of the most beautiful individuals in California. She also was selected to go to the St. Paul Sale.
FAY TRITOMIA HENGERVELD, 30.42 lbs. butter in 7 days, and she is a daughter of Mutual Fobes Longfield De Kol.
WINIFRED HOTALING 3D, 32.19 lbs. butter in 7 days, dam of a 30 lb. junior 4 year old, and out of the same dam as two 33 lb. cows, one of which made 874 lbs. butter in one year.
HERTINGA WILLIS, 1,003.36 lbs. butter from 23,969.4 lbs. milk in one year.
WAYNE OF ROCK MARTHA, 830 lbs. butter from 21,620 lbs. milk in one year as a senior 2 year old, her dam with 800.65 lbs. butter from 17,770.3 lbs. milk in 305 days.
TWO DAUGHTERS OF THE 31 LB. COW Thelma Hartog De Kol, both bred to King Korndyke Pontiac 20th.
TWO DAUGHTERS OF THE 35 LB. COW Trout Brook Pontiac Starin, both bred to King Korndyke Pontiac 20th.
A 22 LB. JUNIOR 2 YEAR OLD daughter of Prince Riverside Walker, bred to King Korndyke Pontiac 20th.
A 28 LB. GRANDDAUGHTER OF KING OF THE PONTIACS, bred to King Korndyke Pontiac 20th.
A 26 LB. COW that made 707 lbs. butter in one year as a senior 3 year old. Bred to King Korndyke Pontiac 20th.
A DAUGHTER OF PRINCE RIVERSIDE WALKER, out of a cow that made over 800 lbs. butter in 305 days and has a daughter that made over 830 lbs. butter in one year as a senior 2 year old.
A HEIFER out of a 27 lb. daughter of Arcady Pontiac Wayne Hengerveld, bred to King Korndyke Pontiac 20th.
MODEL BONNIE ECHO, a 23 lb. show cow, bred to King Korndyke Pontiac 20th.
A 16 LB. 3 YEAR OLD daughter of a 37 lb. sire, bred to King Korndyke Pontiac 20th.
A 21 LB. JUNIOR 2 YEAR OLD granddaughter of King of the Pontiacs, bred to King Korndyke Pontiac 20th.
A 17 LB. 2 YEAR OLD daughter of Prince Riverside Walker. Bred to King Korndyke Pontiac 20th.
A BEAUTIFUL DAUGHTER OF KING MEAD OF RIVERSIDE, bred to Prince Coloma Segis, 34 lb. son of Prince Riverside Walker.
TWENTY DAUGHTERS OF PRINCE RIVERSIDE WALKER, that are positively the outstanding group of daughters of one sire ever offered at public or private sale in the west. These are good enough to go into any herd, and are extraordinary material for foundation stock.

The Bulls in the sale are as high class as the females, including several youngsters of herd heading quality of the first rank

KING KORNDYKE PONTIAC 20TH is without question the most sensational bull that ever appeared in a Pacific Coast sale ring. His breeding is too well known to require repetition here. His first two daughters to freshen have shown production that stamps him as a sire worthy of his inheritance. He stands today as one of the best known, most popular, most promising young sires of the breed, and his presence at the head of any herd will add prestige that could not otherwise be secured by the expenditure of money well up into five figures.

PRINCE RIVERSIDE MADRIGAL MOOIKE by Prince Riverside Walker and out of Madrigal Mooike 2nd, 32.91 lbs. butter in 7 days as a senior 3 year old, 755.95 lbs. butter from 20,160.5 lbs. milk in one year as a junior 2 year old.
KING KORNDYKE PAULA SEGIS by King Korndyke Pontiac 20th, out of Paul Segis, 30 lbs. butter in 7 days, she by Sir Ormsby Burke Segis, son of King Segis.
KING KORNDYKE PONTIAC LEDA by King Korndyke Pontiac 20th, out of a 30 lb. daughter of Korndyke Queen De Kol's Prince and a half sister to Tilly Alcartra.
KING KORNDYKE SENORITA by King Korndyke Pontiac 20th out of a 26 lb. dam that made 707 lbs. butter in one year as a 3 year old.
KING KORNDYKE PONTIAC 23D by King Korndyke Pontiac, out of a 24 lb. daughter of King of the Pontiacs that made 714.17 lbs. butter from 15,889.8 lbs. milk in one year as a senior 2 year old. This bull is just 3 years old, a fine individual, straight and right in every way, ready for the heaviest service.
TWO YOUNGER BULLS of rich breeding and splendid individuality that will make first class investments for owners of high class dairy herds.

Every animal positively guranteed to be a breeder: every animal over six months old tuberculin tested and sold subject to retest by the buyer

NOTE:—Mr. Higdon's herd has been regularly tuberculin tested ever since it was founded, and the very few reactors have always been removed from the herd immediately. In the test for this sale 64 head in all were tested, including some of the heifers that are to be kept, and only one suspect was found. She was immediately removed and does not appear in the sale. There has never been a case of contagious abortion in the herd, and only one cow that has failed to breed.

Poland Chinas

April 24, W. T. Dice and Harrold Waltz, Hanford.

A. W. Morris and Sons, of Woodland, have announced that Tilly Alcartra, world famous Holstein cow, gave birth to a son last week. The arrival of this youngster has been awaited with more than passing interest ever since it became known that Tilly had been sent to the court of Carnation King Sylvia, the $106,000 bull owned hy the Carnation Stock Farms, Seattle, Washington. Weighed in the scales used to measure livestock values, it is doubtful if a calf of greater potential value has been produced within the hreed. The basis for that statement is found in the remarkable combination of bloodlines back of the youngster. His dam is generally rated as the greatest dairy cow in the world and the sire is a son of May Echo Sylvia, holding a place but slightly below Tilly. The calf is entered in the National sale to be held in St. Paul next June, and one man's guess as to what he will fetch is as good as another's — if the guess is high enough. At one time an option was sought for a bull calf from the same mating at the reported price of $50,000.

. H. C. Muddux and Son of Sacramento have recently purchased from Caledonia Farms, West Sacramento, ten Scotch topped Shorthorn cows. Eight of the cows have heifer calves at foot sired by the well known Caledonia herd bulls. It will be remembered that Muddux and Son purchased, at the last California Shorthorn Breeders' sale, the Scotch bull, White Emblem, one of the top bulls in the consignment from the Black Hawk Ranch.

Giant Bob, grand champion Poland China boar at the 1919 California state fair, is dead. Giant Bob was sired by Caldwell's Big Bob, grand champion at the 1918 National Swine Show. He was developed and shown to the championship by Chas. Gatewood of Fresno and was purchased at the Gatewood dispersal sale by Alfred M. Buckland of Fresno and Z. M. Dickey of Dinuba for the record breaking price of $5,250. Giant Bob was conceded to be one of the most acceptable types of Poland Chinas developed in the West and his untimely death will be regretted by all Poland China breeders.

Frank B. Anderson, formerly secretary of the Western Berkshire Congress, has received a letter from the experiment station of Guam to the effect that the shipment of Berkshires recently selected from the herds of this state had arrived at their destination after a stormy passage. It was stated in the letter that the shipment made a very favorable impression on the island and that the initial order will probably open the way for more California Berkshires.

At a recent meeting of the executive committee of the Western Berkshire Congress arrangements were completed for Bruce S. Bennett, formerly of the Cultivator staff, to take over the work of field man for the organization. The Berkshire breeders are the first livestock organization in the West to engage the services of a field man.

Chas. E. Dack, Poland China breeder of Fresno, writes as follows: "Just a line to say that out at Berma Rancho the March litters are doing well. We have three litters by Giant Bob, also a litter from a King's Big Bone Leader gilt. We have been fortunate in escaping the contagious abortion so prevalent throughout the state. A litter of exceptional promise is one whose dam is by King's Big Bone Leader out of a daughter of Caldwell's Big Bob, and they in turn are sired

by Giant Bob. These pigs have about as much Big Bob blood in them as it is possible to get. Big Susie has a corking litter by Prospector. The Indicator, junior herd boar, is coming along fine."

Evergreen Hutch, second prize senior gilt at the Iowa State Fair in 1919, recently purchased by J. F. Lehman, Lodi, from Henry Dorr, Remsen, Iowa, farrowed eight good pigs by Evergreen Model. As the litter are line bred descendants of Big Bob they should make something very good. Mr. Lehman expects to show both sow and litter at Sacramento next September.

Hugh Shinn, Tulare, has a good litter sired by the grand champion of the last National Swine Show, The Pilot. They are out of a Bloemendaal's Big Chief Again sow and are a very promising bunch of youngsters. The Californian, Shinn & Elliott's good herd boar, is a half brother of The Pilot and is siring some unusually good pigs, quite a few of which will be at the state fair and be featured in the big September 27th sale to be held by this firm.

Secretary Chas. W. Paine of the state fair has received word that the American Jersey Cattle Club has decided to double the amount of prize money offered by that association.

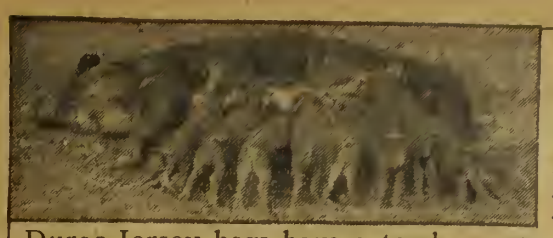
The Toyon Farm Association of Los Altos announces the sale of 15 head of Holstein cattle to Ricardo F de Ferari of Valparaiso, Chile, South America. The importance of this sale is obvious. South America and the Orient will unquestionably as time goes on draw heavily for breeding stock on America. California is the natural point of selection and shipment. This advantage of position will result in sales of magnitude, provided breeders here really go after the business constructively. In this shipment of four bulls and 11 females, the Toyon Farm Association feel they have met the requirements of future business The shipment was all that could be desired in health, quality and price. The consideration of health, the freedom from tuberculosis, not only in the particular individual but in the history of the herd, will determine to a large extent the frequence of these major sales for California in the future. Other sales from Toyon Farms include a young bull, Toyon Beauty Valdessa, to the State Veterans' Home at Yountville. This young sire is a son of Finderne Soldene Valdessa, a son of King Valdessa whose two nearest dams are the first 44 pound cow and the first 40 pound cow respectively. The sire's dam holds the world's record for a heifer with first calf. The dam is by Creamcup Pontiac Burke with 14 A. R. O. daughters, brother to the sire of Vera Wal Princess out of Beauty Ciruela De Kol Johanna who also has several A. R. O. daughters.

E. A. Byer of Byron, has purchased from Toyon Farms, Los Altos, Moxee Inka De Kol Colanthus 2d, a young cow which should be a welcome addition to any herd. The sire is from a granddaughter of Piebe De Kol Burke by a son of Fobes Tritomia Mutual De Kol and Glen De Kol Artis 3d, she a daughter of the noted Homestead Jr. De Kol, sire of the former world's champion seven day butter producer, Grace Fayne 2d's Homestead. The dam is from a daughter of Inka Wit Mercedes De Kol, by a son of Reka Ormsby Prince.

Geo. V. Beckman & Sons, Lodi, are feeling optimistic over the season's prospects. The get of Lakeside Defender is showing up well and they have several choice March litters from which to select their futurity pigs. Sherwood Beckman reports their pig crop as smaller than usual but hopes to give these extra attention.

N. B. Haydon at Hynes owns an outstanding senior yearling Duroc boar in OCK's Pathfinder Del Solano 291231. This boar combines the blood of Orion Cherry King, old Pathfinder and Crimson Wonder. He was bred by Sterling S. Smith of La Mesa. Mr. Haydon has pigs that demonstrate the real worth of such a well bred sire.

At Tu-Toc-a-Nu-La Ranch, Van Nuys, under the management of Mrs. R. E. Whitley, the young Durocs are to be seen in large numbers, and prosperous



MORE PORK IN LESS TIME

Duroc-Jersey hogs have a tendency to put on great amounts of pork at an early age. They are easy-feeding animals, and raise large families. These hogs were introduced less than 50 years ago, and yet in 1918, 51% of all the hogs marketed in the country were "Duroc-Jerseys." They are uniformly red in color. Increase your profits by raising Duroc-Jersey hogs.

Write for "DUROC-JERSEY HOGS ARE PROLIFIC AND PROFITABLE"—sent free to hog-raisers by the largest swine record association in the world. Over 12,000 members.

The National Duroc-Jersey Record Association. Dept. 130 **Peoria, Ill.**

A-1 Duroc Ranch

Where one of the state's greatest herds of Duroc-Jerseys is maintained. For years our Durocs have proven profitable to farmer and breeder alike. Better place your order now for spring pigs as what we will be able to spare will go quickly. Remember, this is the home of the state's highest priced ($1500) and most valuable Duroc-Jersey sow.

J. P. Walker, RFD 1, Box 40½, Visalia, Cal.

Sows and Gilts---GET ONE

Bred to farrow next two months. We are making an extremely low price on these to reduce our herd. At the price we won't keep them long. Write today. Quick, before they are all gone.

H. P. Slocum, Willows, Cal.

SPRING PIGS---DUROC-JERSEYS

sired by ORION'S KING GANO, a boar famous not only for his own great individuality, but for the smoothness and quality of his get. If you want some of these quick maturing, prolific Durocs, write me at once.

Home of King's Big Ben, where he is siring those early developing big type Poland Chinas that are ready for the market at 6 mo. They have size, bone, quality and are from the easy feeding families.

W. Bernstein **Hanford, Cal.**

the easiest way to make money-- SAVE IT

Listen, Dairymen:

Thousands of tons of hay are WASTED every year in California through the commonly used method of feeding hay from the stack into the corral. Much of it is trampled under foot—strewn all around the yard—WASTED. The coarse hay is nosed out by the stock and discarded.

This means a dead loss to you of from 15 per cent to 30 per cent—an average of over 20 per cent of your hay crop. With hay worth $30 per ton why waste $6 out of every ton you feed? How many tons will you use this year? Just figure up what you stand to lose. You can eliminate these losses in this way:

Chop all your hay with an Acme Feed Cutter and blow it ALL into the barn. Then feed it out through openings in the side of the barn into mangers in the corral. In that way ALL your hay will be consumed as food — NONE WASTED. Try it this year.

in high degree. With the exception of two litters they represent the get of the big yearling boar Pathfinder's Model 2d, ranging from eight to 16 pigs to the litter. There are 250 Durocs on the place today, and the equipment is up to date in all particulars and sufficient for a large expansion. A 150 acre tract is being seeded to alfalfa this spring.

A new herd of Durocs, with an old timer in command, is that owned by John Kincaid at Bakersfield. The boar in service is Orion's Cherry King J. K., with a bunch of fine pigs to his credit. He is a 1000 pound prospect. Sows in the herd are daughters of Orion's King Gano, Freddie You'll Do and Uneeda King the Colonel.

D. G. Cummins & Son, Visalia, report a fine litter of 14 Winsor's Giant Orion pigs out of Golden Sensation, the top gilt in the Winsor Ranch sale offering at Los Angeles last winter.

D. G. Maxwell, Waterloo, Iowa, has plans for the establishment of a Holstein breeding farm in San Fernando Valley.

Kern County Union High School, through the Boys' Agricultural Club, will feature a public sale of pure bred swine at Bakersfield on May 15. The get of the $1.500 Poland China boar Kern County Pilot will be among the attractions.

J. T. Dunlap is a big type Poland China fancier at Pomona. He has a Big Timm boar and five select brood sows that he brought from Iowa last fall. He has a public sale in prospect for the coming fall.

Walter Hoover, Chino, contemplates putting in a herd of milking Shorthorns.

The Pacific Coast Hereford Cattle Breeders Association announces the following membership of the executive committee: J. I. Cazier, president; H. M. Barngrover, vice president; J. A. Bunting, secretary; H. H. Gable, W. G. Briggs, W. J. Bemmerly, G. H. True and H. F. Danberg.

The Western Berkshire Congress announces that the first promotion sale will be held at Marysville, April 22. The sale will consist of 20 bred gilts.

At a meeting of livestock interests held in San Francisco April 8, preliminary steps were taken to set in motion a movement to hold a livestock show in San Francisco this fall. A committee was appointed to confer with a representative group of San Francisco business men.

At the last meeting of the board of directors of the Western Berkshire Congress the resignation of James Mills of Hamilton City as president of the congress was accepted. H. C. Muddux of Sacramento was elected president. Alex Wilson of the Italian Vineyard Company, Guasti, was elected to the board of directors to fill the vacancy made by the elevation of Mr. Muddux.

Caledonia Farms, West Sacramento, has recently sold to the university farm, Davis, two young Shorthorn bulls and a high class cow with a calf at foot. The bulls will be used on the new beef cattle project recently undertaken by the university and the cow will be given a place in the university herd. She is a half sister to the famous university cow Glenbrook's Marvel, dam of several of the noted productions of the university herd. The same herd has sold a number of young things to the calf club recently organized in Shasta County.

One of the features of Picnic Day to be held at the university farm, Davis, April 24, will be the inauguration of an annual livestock judging contest among the students of that institution. Prizes will be offered for the best judge of beef cattle, dairy cattle, sheep, hogs and horses. The contest has been planned by the students with the idea of stimulating more interest in livestock work and as a means of getting more practical training than is possible under the present inefficient organization of the college of agriculture. The contest is meeting with wide approval among the students.

Dissolution of Partnership —SALE—

75 Registerd Holsteins 75

Leeman & Kilgore Ranch

Ripon, Cal.
Wednesday
May 12, 1920

To dissolce the partnership now existing in the firm of Leeman & Kilgore, their entire herd of high class registered Holsteins will be dispersed at public sale to the highest bidder.

Although established in recent years this is widely rated as one of the best collections of the breed in the state, containing cattle of unusually popular breeding, of good type, and the herd has always been maintained in good physical condition. Some of the good things in the sale include

MISS GELSCHE WALKER KORNDYKE, 32 lb. daughter of Prince Gelsche Walker and a 29 lb. daughter of Korndyke Queen De Kol's Prince.

FAYNE SPRING FARM PONTIAC DE KOL, 26 lb. 4 year old daughter of Spring Farm King Pontiac 6th.

A 27 POUND DAUGHTER of a 28 pound cow.

A 25 POUND DAUGHTER of Segis Pontiac De Kol Burke out of a 24 lb. 3 year old daughter of King Mead of Riverside.

A DAUGHTER OF KING MORCO ALCARTRA out of a 33 lb. dam that made over 1000 lbs. butter in one year.

SEVERAL 19 TO 24 POUND COWS AND HEIFERS of splendid breeding and in calf to one or the other of the two good herd bulls.

DAUGHTERS OF KING MEAD OF RIVERSIDE, Segis Pontiac De Kol Burke, Prince Gelsche Walker, King Segis Pontiac Jannek, and other sires of great merit.

The Two Herd Bulls

SIR AAGGIE KORNDYKE ALCARTRA—Born Oct. 16, 1915. Sired by Prince Alcartra Korndyke, son of Tilly Alcartra, and out of a dam that made 860.91 lbs. butter from 21208.5 lbs. milk in one year.

KING GELSCHE WALKER KORNDYKE—Born Nov. 22, 1918. Sired by King Morco Alcartra, son of Tilly Alcartra, and out of Miss Gelsche Walker Korndyke, 32.76 lbs. butter in 7 days at 5 yrs. Six of his seven nearest dams average 30.56 lbs. butter and 692.9 lbs. milk in 7 days. Three of his seven nearest dams average 1031.56 lbs. butter from 25832.4 lbs. milk in one year. These two splendid sires will be sold, and all bred females in the sale are, in calf to them.

Every animal positively guaranteed to be a breeder; every animal over six months of age, except a very few to be sold at end of sale, tuberculin tested and sold subject to retest by the buyer.

BREEDING DATE BOOK--FREE

We have issued a covenient little book for the keeping of breeding dates of cattle, hoping to aid the breeder and cattle owner in maintaining accurate records. We will gladly mail you a copy free if you request it. A postal will do.

CALIFORNIA BREEDERS SALES AND PEDIGREE CO.

C. L. Hughes, Sales Manager.

Sacramento Cal.

Jersey breeders of Stanislaus County have organized. D. F. Conant is president, Guy Miller, secretary.

Owing to unsettled conditions, the Poland China sale scheduled by Messrs. W. T. Dice and Harold Waltz of Hanford has been postponed. Mr. Dice has added a number of very choice individuals to his herd and hopes to soon have a sow herd second to none in the state.

Alex D. McCarty, Modesto, certainly has a real big type sire in his young boar The Westerner. One of his pigs was measured on the day it was one month old and showed a four and one-quarter inch bone. Pretty good for that age. The futurity litters by The Westerner and Calibuster are showing up with lots of promise.

The Bonita Stock Farm at Lodi offers at public auction 63 heifers and heifer calves and 27 young bulls, most of them sired by Supreme Glista Pietje, at the ranch on Tuesday, April 20. The dams of the heifers are young cows many of which have official records up to 26 pounds butter and also yearly records, to be made known at the time of the sale, which will be valuable guides to buyers in determining the worth of the youngsters.

At a recent sale of Poland Chinas held by N. K. Horan at Lockeford, the top sow, Darkness A 1st, sold to J. E. Thorp of Lockeford for $210. Prices ruled rather low, ranging from $20 to the price mentioned. The sale was managed and conducted by Cols. Leachman and Snook of Sacramento.

PRICES FOR DRAFT HORSES

The highest prices ever paid for draft horses bought in the open market at Chicago have just been placed on record. The horses were deep bodied, powerfully built drafters, averaging over 1800 pounds each in weight and costing more than $450 each, f. o. b. Chicago. One pair sold for considerably over $1000. Good judges consider this to be the best carload of draft horses ever bought on the Chicago market. They are to be shipped to farms in Maine.

The United States census for 1910 revealed 19,833,000 horses and 4,210,000 mules on farms; and the department of agriculture estimates for January 1, 1920, show 21,109,000 horses and 4,995,000 mules on farms, or an increase of 1,276,000 horses and 785,000 mules in the last decade. Besides this we exported during the nine years ending June 30, 1919, 1,149,763 horses and 376,836 mules.

PERMIT REQUIRED TO SHIP CATTLE TO OKLAHOMA

A recent bulletin received from the state board of agriculture of Oklahoma, states:

"Parties wishing to ship cattle into Oklahoma must write or wire for a permit, which will be issued in duplicate, original permit to be pinned to the tuberculin chart to be sent to this office and duplicate to be pinned to the tuberculin chart accompanying the bill of lading. We are notifying the railroads of Oklahoma not to accept cattle for dairy or breeding, grazing or feeding purposes, without a permit."

LESS WOLL USED IN FEBRUARY

Wool consumed during February was less than that used in January this year, but more than twice as much as was used during the corresponding month last year, according to the monthly report of the bureau of markets.

PREDICT NINE CENT COWS

A number of the best known cattlemen in California, after a thorough survey of conditions on the ranges and in feeding lots, have expressed the opinion that grass cows will bring nine cents a pound on the hoof during May and June. Among the large producers of cattle who have expressed this opinion is Fred H. Bixby, president of the California Cattlemen's Association.

"I believe," said Mr. Bixby, "that cattlemen will get nine cents a pound for cows during May and June. My belief is based upon the apparent shortage of cows throughout the state and the prospective demand.

"There is a good supply of steers now, but cows already are scarce and in considerable demand at firm prices.

"While I am not a prophet and do not undertake to advise other cattlemen, I expect to hold such cows as I may have for a nine cent market."

NOTES OF THE CALIFORNIA CATTLEMEN'S ASSOCIATION

The auction sales of prime cattle in cooperation with farm bureaus as proposed by the California Cattlemen's Association are receiving the approval of stockmen throughout the state. The Monterey County Cattlemen's Association has gone on record as endorsing auction sales as opposed to the union stockyards. The Salinas chamber of commerce has adopted a similar resolution.

The first definite steps towards holding auction sales were taken at a meeting of Northern California and Southern Oregon cattlemen at Montague. It was decided to hold auctions at Cottonwood, Fall River, Klamath Falls and Ashland, Oregon, some time in the early fall.

E. L. McKenzie was appointed leader for the California counties and Miles Cantrell of Rush, Oregon, was chosen leader for the Oregon counties. These two men will be the clearing house for information in these sections.

* * *

The California Cattlemen's Association is offering a trophy for a competitive livestock judging contest to be held on picnic day, April 24, at university farm, Davis. The student having the highest individual score in beef cattle judging will win the association prize.

* * *

Not content with a highly successful meeting at Santa Ynez, the cattlemen of Santa Barbara County immediately called another meeting at Los Olivos on April 3. Considerable business left over from the Santa Ynez meeting will be completed at Los Olivos.

* * *

Northern California enthusiasm for the membership campaign refuses to be downed. It had been planned to limit county meetings to the southern part of the state at this time, but the northern counties could not be restrained, and meetings were called by the Amador-El Dorado Livestock Association at Placerville and the Plumas County Cooperative Stockmen's Association at Oroville, both this week. Fred H. Bixby, president of the state association, was the principal speaker at Placerville.

GLENN COUNTY DUROC BREEDERS ORGANIZE

Between 40 and 50 Glenn County Duroc-Jersey breeders met at Willows, April 10, and organized the Glenn County Duroc-Jersey Breeders Association for the purpose of promoting the welfare of that breed in Glenn County and the upper Sacramento Valley. The meeting followed a banquet at which the necessity of organization was stressed by a number of speakers. For several years the Duroc has been making rapid strides in that county and at the present time it is thought that there are as many individual owners of pure bred Durocs in Glenn County as in any county in the state, and it has been felt that in order to place the breed on the proper footing there should be some sort of organization. The following temporary officers were elected to serve until a permanent organization can be effected: Clayton Slocum, Willows, president; B. F. Small, Willows, secretary. A committee was appointed to prepare a constitution and set of by-laws. The next meeting will be held at Orland May 8.

Senator F. W. Leavitt of Butte City presided at the opening of the meeting. Senator Leavitt announced that an effort is to be made to form a county organization for hog raisers and expressed the hope that similar organizations could be established in every county in California. Clayton Slocum told of the marked advance of the Duroc breed in Glenn County during the past few years and urged that every owner of pure bred Durocs would become identified with the new association. Mr. Guttman, a local merchant of Willows, made a stirring appeal for farmers' organizations of all kinds. Mr. Goatley, farm adviser of Glenn County, told of the work accomplished by the boys' and girls' pig clubs. Other speakers on the program included V. F. Dolcini, vice president of the California Duroc-Jersey Breeders Association; R. P. Royce of the California Cultivator; Ralph Newman of San Francisco, and B. F. Small. Mr. Hollingshead urged that a district futurity show be held at the Glenn County fair.

Buyers of Young Holsteins

You will find as choice a lot of young registered Holstein heifers and bulls in the dispersal sale at

Bonita Stock Farm

Lodi, California

Tuesday, April 20

as you have ever seen in one herd. They are all well grown, in good condition and uniformly well marked.

63 Registered Holstein Heifers

The heifers range from bred heifers down to heifer calves, most of them sired by SUPREME GLISTA PIETJE, whose dam twice made over 32 lbs. butter in 7 days, and also made 631.35 lbs. butter in one year. The dams of these heifers are mostly A. R. O. cows and heifers with official records up to over 26 lbs. butter in 7 days.

27 Registered Holstein Bulls

Quite a few of these are ready for service, and they are a splendid lot, straight, well marked, growthy, and in good condition. Their dams are among the best cows recently sold from this herd.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; NO ANIMAL TUBERCULIN TESTED.

NOTE:—Bonita Stock Farm is 4 miles west of Lodi, 3 miles west of Woodbridge. Parties coming by train will be met at Lodi morning of the sale. Sale begins at 10 A. M.

The Outlook for Beef Cattle

These are uphill days for the cattle feeder in Arizona. High priced feed and low priced beef just now confront the man who thought he would make a good thing of feeding this winter.

Dr. R. H. Williams, animal husbandman of the college of agriculture, University of Arizona, sums up the situation as follows:

"According to the latest figures available as published by the monthly crop reporter there was a total of 44,399,000 beef cattle in the United States on January 1, 1919. This is an increase of about 4½ million cattle since 1916 and an increase of about nine million beef cattle and two million dairy cattle since 1914. Recently in discussing the matter with a member of the United States department of agriculture I said that I did not think the number of cattle had increased in this country as rapidly as the monthly crop reporter indicated. He stated that these figures were secured from about 30,000 reporters and they were the most reliable that can be found anywhere.

"As the United States census will be taken during the present year it will be interesting to compare the number of cattle estimated the year before the census with the number counted in the census. In 1919 the estimates were for 49,000,000 cattle and the census returns indicated that there were 8,250,000 fewer cattle in the countrty than the estimates made the previous year. The opposite conditions occurred in the census taken in 1900 for that year there were 50,500,000 cattle and the preceding year the estimate amounted to only 28,000,000 or a discrepancy of 12,000,000 between what was actually counted in the census and the estimate taken the previous year. There was not a very great difference between the estimate taken the preceding year and the number secured through the census reports for 1870, 1880 and 1890.

"I am fully convinced that the United States has fewer cattle today than in 1915. Since that time the Southwest has had three years of drouth which affected Southern California, Arizona, New Mexico and Texas. Last year the Northwest had a drouth and preceding that extremely cold winters. No doubt the western ranges are at least more lightly stocked than in 1915 or 1916. It is believed that the South, Eastern Texas and Eastern Colorado have more cattle now than four years ago, while the other parts of the country have probably maintained about the same number.

"Unless I have sized up the situation wrongly, there will be an acute shortage of cattle during the next year. Certainly the Southwest and the Northwest will aim to keep most of their females to stock up their ranges. The supply going east will also be less than formerly, for there will he a tendency to keep steers one year longer to utilize the ranges that are understocked. This country cannot expect to export a great number of cattle and the export trade in heef will be less than before the war. As I see the problem in the future the price of cattle will be higher, for there will be greater demand for stock cattle and for beef, and this should indicate that prices will increase. There has heen a distinct tendency for prices to increase in the Southwest and cattlemen are not throwing their animals on hargain counters."

Thoughts of a Cowman

By A. L. Spellmeyer

Chas. Robinson of Clay Robinson was quoted in a daily paper recently, the gist of his advice being: "Stop scrapping about packers methods and get a stockyard in Los Angeles." Now Mr. Rohinson's firm is the higgest in the country and handles much packer husiness and cannot be considered impartial in any packer-producer-consumer discussion. Part of his quoted discourse can be considered propaganda, hut the Robinson outfit shoots square. I cannot he considered a packer's pet but Clay Robinson secured good prices for me whenever I had a shipment to Kansas City, and required no watching, and in last year's heef price drive Chas. Rohinson helped several California producers get from under and gave them straight dope. If more had heeded his advice they would have heen hetter off.

He shows that all packer agitation has its direct effect on the market and the producers stand the bill. Also he favors stockyards for Los Angeles.

The California Cattlemen's Association is thoroughly without strings and has as good a hunch of straight men running it as can be found in the country, yet it is opposed to stockyards and rather favors local auction plans, etc. These men may be right hut I don't think stockyards would be a bit worse here, even if manipulated, than present marketing conditions. Certainly it would bring many new industries and provide a market all the time for any little bunches the small men have to sell.

The general opinion is that the great development of water power and land under the Colorado project will materialize, and if it does this means that the future cattle feeding district of this nation will be in the Southwest. It will mean cattle, hogs and sheep fed for the entire country and a decided change in geographical location of the hulk of livestock. It will mean further requirements for men employed in manufacturing in meat and a vast amount of alfalfa and grain products raised which must be marketed as meat on the hoof.

There is no certain market for livestock, except by private arrangement, nearer than Denver and Kansas City. Livestock prices are usually based on what the Kansas City market will permit, less freight and shrink. A stockyards in Los Angeles would certainly approximate Kansas City prices, without this difference of freight and

TULARE'S BEST CONSIGNMENT SALE

65—Registered Holsteins—65

Sale Pavilion, Tulare, Cal., Thursday, May 6, 1920

There will be no tail end, out of condition consignments in this sale, and among the animals are some of the very choicest yet offered at this popular sale place.

R. C. STURGEON, Tulare, has 38 out of the total of 65 head in the sale, which is a complete dispersal of his females of milking age, and some high class heifers, the sale being necessary on account of the sale of his ranch. All the females in his herd of breeding age are bred to SEGIS PONTIAC ABBEKERK, 35 lb. son of Segis Pontiac De Kol Burke.

R. F. GUERIN, Visalia, makes a consignment composed of some of the best individuals and most highly bred things that have ever left Sunnyside. All the females of breeding age are in calf to KING SADIE VALE IDYL SEGIS, 35 lb. son of King Korndyke Sadie Vale 27th.

ALEX WHALEY, Tulare, sells a great 30 pound cow and two beautiful heifers of rich breeding, all bred to SIR AAGGIE DE KOL ACME 2nd, five of whose seven nearest dams average 1,154 lbs. butter in one year.

THE VICTORY HERD, H. E. Spires, Caruthers, sells four choice females bred to SIR PIEBE DE KOL SEGIS PONTIAC, son of the famous King Segis Pontiac Count, and sire of the 33 lb. 3 year old state record cow of Kansas.

LES McCRACKEN, Ripon, sells ten open heifers, most of them about ready to breed, and they are good ones.

Look Over This List of Choice Females

MELBA HENGERVELD, 30 lb. daughter of Arcady Pontiac Wayne Hengerveld, bred to Sir Aaggie De Kol Acme 2d.

A 28 POUND DAUGHTER of Arcady Pontiac Wayne Hengerveld, to be fresh before sale.

A 25 POUND DAUGHTER of Arcady Pontiac Wayne Hengerveld, that has a 24 lb. 2 year old daughter. Bred to King Sadie Vale Idyl Segis.

A 24 POUND 3 YEAR OLD granddaughter of Segis Pontiac De Kol Burke, whose two year old daughters hold two state records and one world's record for yearly production. Bred to Segis Pontiac Abbekerk.

A 23 POUND DAUGHTER of Arcady Pontiac Wayne Hengerveld, bred to Segis Ponlac Abbekerk.

SEVERAL 18 and 19 POUND COWS AND HEIFERS, bred to high record bulls.

A DAUGHTER OF KING SEGIS ALCARTRA PRILLY, the three times Grand Champion bull, out of a royally bred daughter of the $50,000 bull King Segis Pontiac Alcartra.

A DAUGHTER OF KING KORNDYKE SADIE VALE 27th, out of a 29 lb. dam. Bred to King Sadie Vale Idyl Segis.

A DAUGHTER OF KING KORNDYKE SADIE VALE 27th out of a daughter of Count Segis, bred to King Sadie Idyl Segis.

A DAUGHTER OF KING KORNDYKE SADIE VALE 27th out of a 22 lb. 3 year old daughter of Changeling Butter Boy, second dam a 30 lb. daughter of Tidy Abbekerk Prince that made 985 lbs. butter from over 26,000 lbs. milk in one year.

TWO DAUGHTERS OF SIR AAGGIE DE KOL ACME 2nd, five of whose seven nearest dams average 1154 lbs. butter in one year.

SEVERAL DAUGHTERS OF SEGIS PONTIAC DE KOL LUIT, 32 lb. son of Segis Pontiac De Kol Burke.

SEVERAL DAUGHTERS OF ARALIA DE KOL PONTIAC SALAMBO, whose three nearest dams average 1032.17 lbs. butter and 24,158.2 lbs. milk in one year.

TWO DAUGHTERS OF CREAMCUP FIDESSA CORNUCOPIA LAD, whose dam made 897.09 lbs. butter from 22,751.7 lbs. milk in one year.

TEN OPEN HEIFERS, by 35, 32 and 31 pound sires, and other sires of lesser record dams but of rich breeding.

A GRANDDAUGHTER OF SEGIS PONTIAC DE KOL BURKE, bred to Sir Piebe De Kol Segis Pontiac.

THREE WELL BRED YOUNG FEMALES, all in calf to Sir Piebe De Kol Segis Pontiac.

Only Three Young Bulls In This Sale

This is essentially an offering of high class females, but there are also three well bred young bulls that should find favor with quality buyers. Two of these are sons of Sir Aaggie De Kol Acme 2nd, Alex Whaley's great young herd sire, and the other is a son of King Sadie Vale Idyl Segis, the royally bred bull heading R. F. Guerin's Sunnyside Herd.

THE CATTLE IN THIS OFFERING ARE CHOICE THROUGHOUT. EVERY ONE POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ONE OVER SIX MONTHS OLD TUBERCULIN TESTED AND SOLD SUBJECT TO RETEST BY THE BUYER.

Catalog Free on Request. Management

shrink approximating over two cents per pound.

Future increased production depends upon the little men, and surely stockyards would help them with a sure market, make a certain premium for better bred stock and allow them to replace their needs without waste of time or expense in trying to find a bunch of stock, and if they find it, haggling over a price problematical and uncertain. Stockyards would provide an element of stability at least in uniform prices. The times have about outworn the crude market abuses, and the old guard with the ingrained habit of putting these things over will be displaced by more far-sighted direction. A government controlled stockyards would be worthy of progressive California, but even a packer stockyards is better than none in my humble opinion.

Problem No. 1: If five packers slaughter ten million cattle yearly and one packer spends $25,000,000 to influence public opinion through propaganda what is the division of the packer dollar?

Problem No. 2: When hundreds of thousands of cattle producers and feeders figure their business unprofitable why are T-bone steaks 60 cents per pound?

Problem No. 3: Why the hubbub about 150 million pounds of government war beef at half price in a country of 120 million population just as our fair state expects some grass beef, after a costly drouth? One and one-quarter pounds of meat to the person is not a vast surplus and is dangerous only in the threat against one particular district. Bunk! and another bogy to scare the kids. It might flood one market but spread out might cause a healthy adjustment of retail prices for consumers and a final benefit to producers.

We hear prices are going to decline soon on California beef, and it is not surprising as the time has arrived for the annual collection when grass beef arrives in volume. There is always the refrigerator and beef keeps, and when the grass beef run stops prices rise and the world wags merrily on.

Theologians of all Christian religion expound the principle of "one fair price." Patrick Henry I believe said "Give us liberty or give us death," yet a good man prominent in meat circles of the commission business advises cowmen to stop fighting as they foot the hill in the end. It is no news but still there are some men who at times are weak enough to advocate better conditions as a matter of principle irrespective of personal profit.

Cattle prices in the range districts show strength as ten months southern yearlings have already been contracted in Arizona to the number of over 20,000 head at $42.50 per head up. Colorado and Texas are both busy. A couple of thousand coming two year olds were contracted by Colorado at nine cents or better for June delivery in Northern Arizona and they should weigh better than 750 pounds and bring $67.50 per head or more.

One of the season's jokes was the criticism of the California Cultivator for printing milk substitute and packers ads by an esteemed contemporary in the farm paper business, when Frank Thomas who runs the Cultivator was the first on this coast to take a producers stand, free and independent of any possible loss of advertising. As a matter of fact it required nerve to do what Mr. Thomas did when he did it, as 99 per cent of the people and inspired journals were unanimous in praise of the very efficient packers. The Cultivator increased in size and strength, in circulation and even in packers' ads, but held to a straight even course without weakening for producers and production.

KERN COUNTY BOYS TO HOLD POLAND CHINA SALE

Announcement has been made that the boys' agricultural club of the Kern County union high school will hold their first pure bred hog sale May 15 at Bakersfield. This sale will offer about 60 head of pure bred hogs, including three sows and litters sired by Kern County Pilot; ten tried sows bred to Kern County Pilot; 12 fall gilts bred to Kern County Pilot; 15 open gilts; five boars, three of which will be Poland China, one Duroc and one Berkshire. The remainder of the 15 head will be weanling pigs.

The boys' club has invested $5,550 in original stock, of which this sale of 60 head is the first public offering. During the winter and spring the boys have been selling to local farmers in Kern County weanling pigs at prices ranging from $30 to $75 each. These sales have amounted to about $2,500.

The high school boys' herd sire, Kern County Pilot, cost them $1,000 as a nine months' old pig. He was one year old March 1, 1920, weighed about 450 and had a ten inch bone. He is a full brother to "The Pilot," grand champion of the National Swine Show last fall.

In holding this pure bred hog sale at Bakersfield the boys' club has in mind offering the public the best of their pigs and stock to stimulate the hog industry in the southern part of the San Joaquin Valley.

RECORD BREAKING PRICES FOR DRAFT HORSES

The highest prices ever paid for draft horses bought in the open market at Chicago have just been placed on record, according to Wayne Dinsmore, secretary of the Horse Association of America.

Messrs. Richards and Slipp of Fort Fairfield, Maine, spent two weeks at the Union Stock Yards, Chicago, purchasing a consignment for shipment to the potato fields of Maine. Their selections were deep-bodied, powerfully built drafters, averaging over 1,800 pounds each in weight and costing more than $450 each, f. o. b. Chicago. One pair sold for considerably over $1,000. Good judges consider this to be the best carload of draft horses ever bought on the Chicago market.

The United States census for 1910 revealed 19,833,000 horses and 4,210,000 mules on farms; and the department of agriculture estimates for January 1, 1920, show 21,109,000 horses and 4,995,000 mules on farms, or an increase of 1,276,000 horses and 785,000 mules in the last decade. Besides this we exported during the nine years ending June 30, 1919, 1,149,763 horses and 376,836 mules.

The rise in prices for good draft horses and mules in spite of the existence of more than 21,000,000 horses and almost 5,000,000 mules on farms indicates how agricultural and transportation needs are growing. Good authorities predict a steady rise in prices of horses and mules for the next three years.

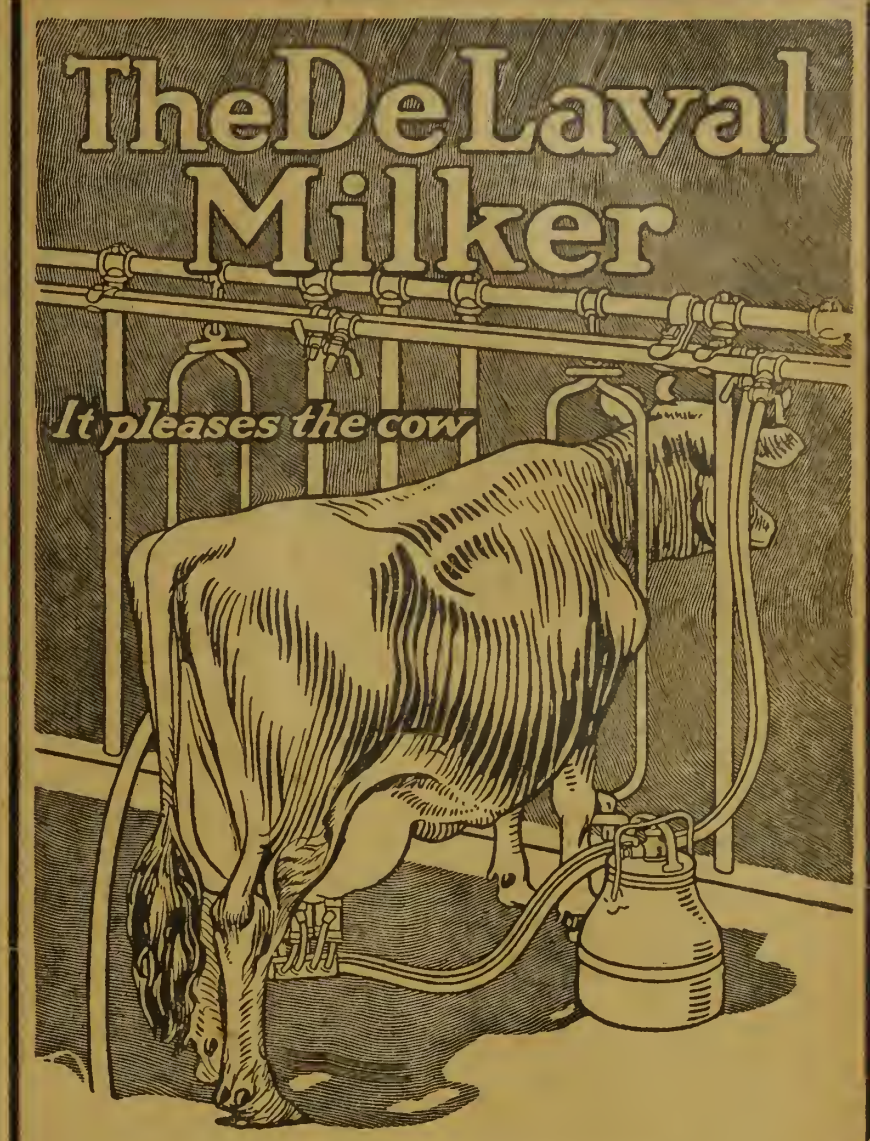
WILL SPEED UP TB WORK

Recognition of the intradermic method of applying the first test preparatory to accrediting a herd as free from tuberculosis, has just been announced by the bureau of animal industry, United States department of agriculture. The more general use of the intradermic test is expected to "speed up" the federal and state cooperative campaign against TB. In the subcutaneous method, heretofore generally used, the tuberculin is inserted beneath the skin and it is necessary to take three preliminary temperature records of the animal and at least seven soon after the test. In the intradermic method insertion is made between the layers of the skin, and, while this method requires a greater degree of skill in the operator, only one later inspection of the animal may be sufficient to indicate the presence or absence of the disease.

The federal recognition of the intradermic method provides, however, that herds undergoing it successfully must pass a subcutaneous test within a year before they can be accredited as free from tuberculosis. The intradermic test has been recognized also by about three-fourths of the 45 states now cooperating with the federal government in the TB work.

Texas recently became the forty-fifth state engaged in the cooperative campaign. The three states not yet engaged in it are Arizona, Colorado and California. Arizona and Colorado are expected to receive authority to enter the work at the next sessions of their legislatures.

The state of California annually produces about 85,000 acres of potatoes. To plant this crop, about 700,000 sacks of seed potatoes are required. Upon the quality of this seed depends the success of the potato growers and the amount and quality of the potatoes offered for sale on our markets.



Over Forty Years Ago—

the De Laval Cream Separator came to the aid of the dairy farmer. It eliminated a great deal of the drudgery from dairying and made possible a world-wide advance in the dairy industry.

The De Laval Milker is also an important invention and comes to the dairyman's aid to do away with the drudgery of hand milking. It has been thoroughly tested and has proved highly satisfactory, in practical operation on cows of every breed for the past three years, and has been put on the market with the confidence that it will add new impetus to the dairy industry and further enhance the world-wide prestige of the name DE LAVAL.

The De Laval Milker is a distinctly different type of machine, both as to design and operation, positive and uniform in action from day to day; and faster, more economical and more reliable than any other method of milking. The sanitary features are of special importance and will be much appreciated by dairymen in their efforts to produce milk having the highest market value.

An additional insurance of lasting satisfaction to users of De Laval Milkers lies in the De Laval Company's well-known facilities and reputation for service.

The Milker you have hoped for.

Write to nearest De Laval office for Milker Catalog, mentioning number of cows milked

KILL THE CATS

There are some points wherein there are violent disagreements between producers of the state and the state fish and game commission. This is caused by the radical difference in feelings of the one who sees his crops destroyed and the one who desires to maintain "sportsmanship." However, on one point there is entire cooperatioon. This is in the effort to destroy wildcats and mountain lions. The wildcat's depredations are not entirely ou the poultry of the farmer, for he feeds very largely upon birds and to a far greater degree than does the ordinary house cat. Especially is this the case with young quail. Likewise in the matter of mountain lions the lambs and the young stock are not the only victims. H. C. Bryant of the state fish and game commission writes:

"Emphasis can be laid upon the mountain lion and the wildcat as destroyers of game. It is estimated that every adult mountain lion kills on an average one deer a week throughout the year. Consequently our deer supply can be easily augmented by reducing the number of mountain lions."

The fish and game commission offers a bounty of $20 for each male and $30 for each female mountain lion killed. The commission has paid bounties on well up toward 3,000 lions. The number of bounties paid is reduced somewhat every year, which indicates that the number in our mountains is being reduced.

AUSTRALIAN SOLDIER FARMERS

A. L. Williams of Queensland, one of 97 "Anzac" farmers sent to the United States to study farming conditions and practices, called on the Cultivator and expressed his appreciation of the hospitality shown him, the valuable aid extended, the opportunities this state afforded investigators and the astounding amount of knowledge easily obtained in this most up-to-date of all agricultural states. All of which we accepted and admitted.

The 97 farmer soldiers come from every Australian state, representing every line of agricultural activity—stock raising, wheat growing, orchard and truck gardening crops. They have been in the state or neighboring states for six months, their government paying all expenses. About 25 are going back at once; the remainder will stay for four to six months longer. Mr. Williams says that he sows early wheat for hay in March, for grain in May. The harvest runs from October to December. He says many are puzzled over the name Anzac. It is formed from the initial letters of Australian-New Zealand Army Corps.—E. C. B.

RATIONS FOR BABY CHICKS

(Continued from Page 647.)

scrap, 1 part ground bone 0.3 part powdered charcoal. All these proportions are by weight.

At the Storrs experiment station the first feed is sour milk, and it is considered so important that if the chicks are a little slow about tasting it each chick is taken and its beak dipped in the milk so that it gets two or three good swallows before it is put into the brooder. Milk is kept before the chicks all the time the first week and longer if available.

Grit, charcoal and a little chick feed scattered in a thin layer of litter is the first feed, and nothing else is fed till the beginning of the second week. The composition of the chick feed is as follows:

Cracked wheat, 15 parts by weight; fine cracked corn, 15 parts; pinhead oats, 10 parts; broken rice, 3 parts; chick grit, 5 parts; fine charcoal, 3 parts.

At Purdue (Indiana station) the chicks are starved from 48 to 60 hours and then are given this grain mixture: 10 pounds each of sifted cracked corn, cracked wheat and steel cut oats. When the chicks are five or six days old, the following dry mash is put before them in hoppers: 10 pounds each of shorts and bran, 5 pounds each of corn meal and beef scrap, 2½ pounds charcoal. With this is fed all the sour milk the chicks will eat. If sour milk is not fed, the amount of beef scrap is increased to 15 pounds.

After the First Week

It is evident from the above sample rations that the feeding the first week is very simple and the important thing is not so much what is fed as that the ration be suitable for the delicate digestion of a very young animal, and that it be neither too early fed nor too heavy. Bread and egg for a small flock is a splendid starter, and I have had excellent success with dry bread slightly moistened with sweet milk, after the first day. It seems essential that the first meal should be dry, either the eggs and bread or oats of some sort.

Real feeding begins with the second week, and it is of vital importance that the ration from this time contain such variety and so much animal food that growth will be as rapid as is consistent with health.

At Cornell the second and third weeks the johnnycake and grain ration given above is continued, but instead of the clear bran is fed a mixture consisting of 8 pounds bran and 2 pounds beef scrap. From the third to the sixth week the same grain ration is given, and one feed of johnnycake daily, but the latter was gradually discontinued, and the chicks worked onto what has become famous as the "Cornell mash": bran, 200 pounds; corn meal, 100 pounds; middlings, 100 pounds; beef scrap, 100 pounds. The beef scrap, it will be noticed, is 20 per cent of the whole by weight, and this is not too large a proportion of meat for chicks that have no milk. If milk is used, either sour or sweet, the amount of beef scrap should be diminished.

At Davis the mash which was commenced the sixth day is continued till the pullets are ready for the laying ration and the cockerels for fattening. It is left before them only a short time each day at first, but the time is gradually lengthened till by the time they are two months old they have it all the time.

At Storrs the mash which is fed after the first week consists of 10 parts bran (by weight), 5 parts corn meal, 5 parts middlings, 5 parts ground oats and 5 parts beef scrap.

Here the question arises, what is to be done when middlings and ground oats are not to be had or are prohibitive in price, and I cannot do better than repeat the formula used by Cornele G. Ross, which was published a few weeks ago. This formula is no better than those already given, but it has the advantage that all the ingredients are now available: 35 per cent wheat bran, 10 per cent low grade flour, 22½ per cent corn meal, 10 per cent ground oats or rolled oats, 10 per cent ground milo, 7½ per cent beef scrap, 5 per cent ground bone. To each 100 pounds of mash 2½ pounds charcoal and one-half pound salt are added.

With this mash is used a scratch feed consisting of 35 per cent cracked wheat, 25 per cent cracked corn, 30 per cent cracked milo, and 1 per cent whole oat groats.

After 30 days this is changed to a growing mash in which there is more bran and less corn meal and beef scrap.

Commercial Mashes

For those who do not care to mix their own mashes there are many good commercial mashes on the market, both chick and growing mashes. Most of these are mixed with great care and while they may be a little more expensive than those mixed at home, they are also less trouble. The commercial chick feeds, however, are nearly all too fine. Little chicks do not need as finely ground grain as most of these contain, and there would seem no good reason why they should not be ground a good deal coarser. When a little whole grain is mixed with the chick grain from the start it is astonishing how soon the chicks come to prefer it. After two weeks cracked corn and whole milo and Gyp corn are eaten quite as readily as the finer chick feeds, and they are better for the chicks.

It will be noticed that nearly all the formulas given contain ground bone. This is extremely important, for we must feed first of all for frame, and frame requires good solid bone. Complaints of leg weakness frequently come from flocks where bone making material has been lacking in the mash. Chicks that have good range can do very well without ground bone, but chicks that are confined, especially in large flocks, must have it.

It seems hardly necessary to mention green feed here, so thoroughly is its importance understood. The chick does not care for greens the first week. After that it should have access to them as freely and as frequently as possible. Cut-up lettuce is perhaps the very best green for the littlest chicks. It may be mixed with egg and bread, if this ration is fed, after three or four days. If it is chopped at first the chicks eat it more readily, but as soon as they have learned to like it the leaves may be given whole. If lettuce is not available, cut alfalfa or clover or chard is nearly as good.

While cut greens may answer the purpose, there is nothing like greens on the stem (i. e., growing in the ground) for all ages of fowls. Most poultrymen provide a run with young, tender barley growing in it for their little chicks. If this is not practicable, the scheme of Mrs. C. W. Sebastian of Wasco is a good one. Mrs. Sebastian raises her chicks a hundred at a time in a small heated brooder. On one side of the hover is kept a shallow box in which barley is grown to the length of an inch and a half before the chicks have a chance at it. As soon as they have eaten the barley off this box another is put in its place. On the other side of the hover is a cool runway, the floor of which is covered with dry alfalfa leaves.

Whatever green is fed, see that it is fresh, and remember no green is quite so good as that which the chick rustles for itself. The chick on green range can manage with a good deal less other feed, and is not nearly so particular about a careful balance as the confined chick. Its appetite is keener, its digestion better, and it is not a victim to leg weakness nor the vices of toe picking and feather pulling.

Poultry Queries

Conducted by J. A. Koethen

Brownish Yolk

Two or three of my hens lay an egg with an extremely dark brownish yolk. Can you tell me the cause of this?—Subscriber, Julian.

The tint of the yolk is usually determined by the character and abundance of the green feed. When no greens are given, you will see a very pale yolk. Alfalfa gives a rich golden yellow color. I do not know just what green would make the yolk so very

For Sick Chickens

Preventive and curative of colds, roup, canker, swelled head, sore head, chicken pox, limber neck, sour crop, abscess, bowel trouble, etc. Mrs. T. A. Morley of Gallen, Mich., says: "Have used Germozone 17 yrs. for chickens and could not get along without it." Geo. F. Vickerman, Rockdale, N. Y., says: "Have used Germozone 12 years; the best for bowel troubles I ever found." Frank Siuka, Chicago, Ill., writes: "I have lost but 1 pigeon and no chickens in the 3 yrs. I have been using Germozone." C. O. Patrain, Moline, Ill.: "I never had a sick chick all last season." Bernard Hornung, Kirksville, Mo., says: "Cured my puniest chicks this spring." Ralph Wurst, Erie, Pa., says: "Not a case of white diarrhoea in 3 yrs. I raise over a thousand a year." Good also for rabbits, birds, pet stock.

GERMOZONE is sold generally at drug and seed stores. Don't risk a substitute. We mail from Omaha postpaid in new 25c, 75c and $1.50 sizes. Poultry books free.

dark, but have no doubt the dark tint in due to something unusual in the green feed.

Electric Incubators

Will you please inform me as to where I can obtain information regarding electrically heated incubators? On the premises I am occupying I cannot use the oil heating pattern, and have only hearsay knowledge of the use of electricity.—F. B., Pittsburg, California.

I have mailed you the names of several firms which handle or manufacture electric incubators. Some of the biggest hatcheries are using them now, and there is no doubt of their efficiency. The only objection I have ever heard to their use is the expense, and now, with increased prices and poor quality of gasoline and distillate, that objection will hardly stand.

Naked Hen

A ten months' old R. I. Red hen has never grown her wing feathers and her body is practically nude, and always has been. She does not roost with the other hens and lays her eggs in a nest of her own manufacture. What's the matter?—A. B. W., Upland.

If this hen was reared in a brooder I should say she had been overheated. If she is hen-reared I can only suggest lack of vitality coupled with an insufficiency of protein in the feed while she was growing. It is always the chicks of lower vitality that are backward in growing their feathers. Probably her exclusiveness is due to the fact that the other hens tease her a little.

Blackeye Beans

I have been told that blackeye beans (cowpeas) make very good chicken feed and that the hens eat them readily, but have talked with no one in this section who has fed them. I can raise these beans to good advantage in my orchard and would feed them in conjunction with wheat, milo and barley. Please advise if they make good feed and if hens eat them readily.—Subscriber, Merced.

I have not heard of any one using them, but Professor Jaffa mentions the blackeye bean in his list of grains suitable for poultry, and this should be sufficient guarantee of their character. Their nutritive ratio is 1:3.3, while that of the common dried white bean is 1:2.9, which means that the latter contains more protein. I think you will find, however, that they need to be ground and mixed in the mash or cracked quite fine. Hens do not readily eat any kind of beans at first, but they can be taught to eat them as well as any other kind of feed by a little tact in disguising them.

Toe-Picking

I have been unable to find anything that would keep young Leghorn chicks from picking at each others' toes, and even actually killing one another. Can you give a sufficient preventive? —Subscriber, Merced.

A clever woman who raises several thousand chicks each season told me her only remedy for toe-picking was to darken the windows and put the chicks to bed several times a day. After they had eaten and played till they began to get restless she just tucked them away in the dark like naughty children till they were good again. Some poultrymen have claimed to find deep litter a preventive for this vice, and others think if they can keep the chicks busy they will not pick toes, but this woman's cure struck me as the most sensible of all.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, March 29, 1920. Report for week ending March 26.

The upward trend in production continues in the egg laying contest at Storrs. In the twenty-first week the total output was 4,329 eggs, or a yield of nearly 62 per cent. Using previous records for reckoning, a gradual weekly increase in the number of eggs produced will continue for another seven weeks. In other words the zenith of production is expected the second week in May, during which the hens in the contest will on the average lay more eggs than any other week in the year. A pen of Barred Rocks from Westhampton Beach, Long Island, won first place for the week with a yield of 63 eggs.

In reporting on the progress of the laying contest, egg production is nearly always put on a percentage basis in addition to giving the actual number of eggs laid. There are seldom or never two flocks of poultry containing the same number of hens, it is therefore obvious that the actual number of eggs laid by different sized flocks do not afford an easy comparison of the performance. On the other hand the percentage plan at once determines which flock is laying at the higher rate. To obtain the per cent production on any flock it is only necessary to divide this number into the weeks actual yield of 4,329 eggs. It is found that the birds laid last week at the rate of 61.8 per cent. The one best single week at Storrs occurred in the spring of 1918 in the twenty-elghth week of the seventh contest; the yield amounted to approximately 70 per cent or nearly 4,900 eggs.

The three best pens in each of the principal varieties are as follows:

Plymouth Rocks

Oneck Farm (Barred), 712; Jules F. Francais (Barred), 709; Merritt M. Clark (Barred), 674.

White Wyandottes

RICE

The domestic market is showing a fair amount of activity in spot fancy which is generally held at $11.75, although some lots are available at slightly under this figure. Porto Rican and Cuban demand continues, with almost daily foreign inquiries being received. Higher levels are most probable in near future.

BEANS

Jobbing price per cwt.: Small white, 6.20@6.25; large white, 6.00@6.35; cranberry, 6.90@7.00; red Mexican, 7.75@8.50; pink, 6.25@6.40; California Bayo, 9.00@9.25; blackeye, 7.10@7.25; red kidney, 13.00@13.25; lima, 11.00@11.25; Garvanza, 9.00@9.50; Kotenashis (in bond), old crop, 5.25; new crop, 5.75.
Dried Peas—California, 5.25@5.50 per cental for green, recleaned.

HOPS

1919 crop, 70@85c per lb.; older growth, 45@55 per lb.; prices to growers for 1920 crop, 50@65 per lb.

GRAIN

Wheat: The prices are based upon Federal grades and standards at the terminals in San Francisco bay and Los Angeles and are as follows per bushel of 60 pounds:

Hard White—	Per Bus.	Per Cen.
No. 1	$2.20	$3.63 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	$2.18	$2.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51½
Club and Sonora—		
No. 1	$2.16	$3.00
No. 2	2.13	3.55
No. 3	2.00	3.48½

The above are minimum prices.
For sacked grain add 4½ cents per bushel to the above prices. Deduction of three-fourths of a pound made for weight of standard grain bags. Wheat grading under No. 3 mixed or smutty wheat will be purchased according to merit.
Oats: Red feed, 3.15@3.25.
Corn: California yellow 3.10@3.15 per cental; Egyptian white 3.50@3.65; milo maize 3.00@3.10.

HAY

Under date of April 10, Scott-Magner & Miller says:

Choice Tame Oat hay	37.00@40.00
Other Tame Oat hay	33.00@37.00
Wild Oat hay	Nominal
Barley hay	Nominal
Alfalfa hay	32.00@37.00
Stock hay	29.00@32.00
Oregon Cheat and Oat mixed	29.00@32.00
No. 1 Barley straw, bale	70@1.00

Citrus Markets

Los Angeles, April 14, 1920.

The strike has prevented large shipments and picking has been largely discontinued. Stock which has been delivered is commanding good prices. Some navel sections are practically cleaned up. There will he reduced shipping from other sections for a few weeks.
F. o. b. quotations on lemons running around $3. Sales in auctions have been very limited and prices have ruled low.

Shipments

Shipments of citrus fruit to date from Southern California since November 1, 1919: Oranges, 14,396 cars; lemons, 2,778; total, 17,174. To same date last season: Oranges, 15,469; lemons, 3,584; total, 19,053. From Central California this season: Oranges, 4,006; lemons, 281; total, 4,287. To same date last season: Oranges, 2,298; lemons, 251; total, 2,549. From Northern California this season Oranges, 260; lemons, 20; total, 280. To same date last season: Oranges, 234.

Pittsburg: 1 or., 1 lem. Nav. 7.15, lem. 3.60-4.85.

MARKET NOTES

On account of the railroad strike there is no shipping news for the past week and this has had a depressing effect on Los Angeles markets. The new onion crop has dropped in price and so has the holdover 1919 crop. Potatoes are slightly higher, the ordinary run in carload lots being quoted at $8 straight while Idaho Russets bring $9. Summer squash has fallen to $1 a crate and peas are one cent lower. Asparagus is down to six to nine cents. Lettuce is stable in price. The only new product in local stalls is the loquat.

STATE STANDARDIZATION

The state department of agriculture has strengthened its standardization work by putting into effect a cooperative agreement with the federal bureau of markets whereby the state of California will be enabled to utilize the trained services of federal employes in an endeavor to make state laws coordinate with national laws. While this agreement has not yet been formally approved by the secretary of agriculture at Washington, the plans have progressed so far that little doubt is entertained of its final consummation.

Fred W. Read who has been in this work for the federal government for five or six years and lately in charge of the branch office of United States bureau of markets at Los Angeles, will take charge of the office of standardization at Sacramento some time in May. This will be a joint office under the California state department of agriculture and the United States bureau of markets. In the meantime Mr. Read will make a tour of the principal markets of the eastern states. The Los Angeles office formerly in charge of Mr. Read will be taken over by John W. Law some time next week. Mr. Law comes from the Denver office and is a trained and experienced food products inspector.

BULLETION ON FOUL BROOD
